ñ	Fr. nasal <i>m</i> or <i>n</i> , as in <i>embonpoint</i> , <i>Jean</i> , <i>temps</i>	' (prime), " (secondary)	accents, to indicate syllabic stress

THE ENCYCLOPEDIA AMERICANA

D the fourth letter of the English alphabet and the third consonant, is a sonant dental corresponding to the mute dental T. It holds the same place in the alphabets of the Phœnician, Syrian, Chaldee, Hebrew, Samaritan, Greek, and Latin, and in those of all the modern European languages, except the Russian and the two or three others which retain the Cyrillic alphabet; in these the symbol of delta is the fifth letter. The most ancient forms of the symbol D in the languages of Phœnicia, Palestine, etc., are angular with the vertex pointing to the left, for example, , , and the most ancient Greek form was the same angular figure reversed,  (changed afterward to ). In some ancient Greek inscriptions in Hellas itself and in the Greek colonies the angular form of the primitive delta () is rounded to the form D, and this form was adopted by the Latins, who got it from the Greeks settled in the southern extremity of the Italian peninsula. The sound of D is produced by pressing the end of the tongue against the upper gums and then forcing the vocalized breath into the mouth. The point of contact of the tip of the tongue with the gums in articulating the sound of D in English pronunciation is a little higher above the insertion of the teeth than when the D of those speaking other languages is sounded, and the same is to be said of the production of the sound of T: the d of continental Europeans is nearer to dh than to the sound of d in English speech. Hence the English sound is alveolar rather than dental. The letter D in very many English words represents an element in the speech of our early language ancestors which became for the Greeks theta (*θ, th*), for the Latins *f*, for the Germans *t*, for example, Eng. *deer*, Gr. *θηρ*, Lat. *fera*, Ger. *tier*. More curious is the change of the Greek name *Odysseus* to the form *Ulysses* in Latin, and within the Latin language itself the change of *olor* to *odor*, and from *dacrima* to *lacrima*. In many words in English *d* is intercalated or appended for phonetic reasons, for example, Old English *thonor* becomes *thunder*, Old English *soun* becomes

sound, Norman English *jaunisse* becomes *jaundice*; on the other hand the *d* is dropped out of some words, for example, Old English *woodbind* becomes *woodbine*; *godsib*, *gossip*; *godspel*, *gospel*.

D is the Latin numerical symbol for five hundred. The ancient Romans represented a thousand by the symbol CIO, and they took one half of that symbol to express half a thousand, five hundred (IO, which came to be written D). The symbol D with a horizontal stroke over it () stood for five thousand. In Roman personal names D stood for the prænomen Decimus; thus D. Junius Brutus.

As an initial it is used:

1. In chronology, (1) For *Domini*, genit. sing. of Latin. *Dominus*=Lord, as A. D.=*Anno Domini*=in the year of our Lord. (2) For died.

2. In music, as an abbreviation for *Discantus*, *Dessus*, *Destra*, etc.

3. In university degrees, etc., for Doctor, as M.D.=Doctor of Medicine; D.C.L.=Doctor of Civil Law; D.D.=Doctor of Divinity; D.Sc.=Doctor of Science, etc.

4. In English titles, for duke.

D as a symbol is used:

1. In chemistry, didymium.

2. In music.

(1) For the first note of the Phrygian, afterward called the Dorian, mode.

(2) For the second note of the normal scale of C corresponding to the Italian *re*.

(3) For the major scale having two sharps and for the minor scale having one flat in its signature.

(4) For a string tuned to D, for example, the third string of the violin, the second of the viola and violoncello.

(5) For a clef in old mensurable music, *D excellens*.

(6) For *do* in the tonic sol-fa system.

3. In biblical criticism, for the Beza manuscript of the Greek New Testament.

4. In commerce, for English penny or pence, as £ s. d.=pounds, shillings, and pence, being the initial of Latin *denarius*.

Daae, dǎ'é, **Ludvig**, Norwegian historian: b. Aremark, near Frederikshald, 7 Dec. 1834; d. Christiania May 1893. He was for 20 years an active member of the Storting; was several times minister in the various Radical cabinets; and won several gold medals with his historical essays on ancient Norway. He paid particular attention to the annals of his own country; his best-known works being: 'Norwegian Village Legends' (1870-2); 'Norway's Saints' (1879); 'The Migrations of the Norsemen to Holland and England' (1880); and others in this field.

Dab, a popular name given to several species of flatfish (*Pleuronectidae*), which are found on European sea-coasts. The best known of these is the plaice or fluke. This edible fish is covered with small imbricated scales of brown color mottled with orange spots, and averages about two pounds in weight. In London 3,000,000 of them are consumed annually. The American *Pleuronectes* is the common flounder of the northeastern Atlantic coast, of many species, and an excellent table-fish. The habits of all these flatfish are similar. They live on the shallow bottom, and when danger approaches bury their bodies in the mud, leaving only the eyes exposed.

Dabaiba (also written Dabaybe, d'Abaibe, etc.), a region lying south of the Gulf of Darien, of which the boundaries were never exactly defined. Spanish adventurers in the 16th century learned, as a matter of common report, that they might find there, or at least by exploring in that general direction, a temple lined with gold; and in this half-true story told by the Indians of Darien we probably have the earliest form of the Eldorado myth. Balboa, when governor on the Isthmus, organized a Dabaiba expedition which he led in person (1512). One hundred and sixty men in two brigantines proceeded up the Atrato River, but made little headway against the hostile natives. Governor Pedrarias Davila (June 1515) sent 200 men under Luis Carrillo and Balboa on the same errand. Attacked by Indians on the Atrato, one half of the soldiers were killed, and the survivors took nothing but news of shameful defeat back to the coast. It seemed that "the mysterious dominion so mysteriously defended must hold great treasure, and in the inflamed minds of the Christians the savage pantheon of Dabaiba had risen into a lofty edifice glittering with gold and gems, and situated in a region rich and beautiful beyond comparison." (H. H. Bancroft.) Subsequently an expedition of 160 men under Tabira and Birues, with light brigantines and canoes, tempted fate upon the river. The savages on this occasion enjoyed more than their usual measure of supernatural protection, for "the divinity of the golden temple" sent a flood which uprooted trees, overturned one of the vessels, and drowned both leaders. Even Francisco Pizarro, who was of the party, shared the superstitious fears inspired by these events to such a degree that he declined to assume command and continue the quest. Peter Martyr speaks of four attempts to gain the golden temple, one expedition attaining a distance up the river of 80 leagues; but "wonderful mischance! — the unarmed and naked people always overcame the armed and armored." Francisco César, captain of infantry, starting from San Sebastian

in 1536, with 80 foot-soldiers and 20 horse penetrated a short way into the mountains, returning with treasure valued at 30,000 castellanos. Pedro de Heredia in the same year led 210 mail-clad men into the sierra, but came back empty-handed. César, repeating his experiment, secured treasure amounting to 40,000 ducats. Next, Badillo led 350 men from Cartagena to explore the same region in 1537. The expedition lasted more than a year, and was a complete failure. One half of the soldiers died; Badillo was ruined and disgraced; César, who accompanied him, lost his life. Such luring by occasional gains, such varied and dire misfortunes seemed the work of enchantment; but a realistic explanation is not far to seek. We know that the territory southeast of the Gulf of Urabá or Darien was subject to a cacique named Dabaybe; his name is still given to a village in the department of Antioquia and to a spur of the Western Cordillera in Colombia. This mountain range for years was an insuperable barrier preventing the isthmian Spaniards from extending their domain overland toward the south. Accordingly their eager search was fruitless, though the temple actually was in existence. The Indian stories described, accurately enough, the splendors of the Inca empire, of Curi-cancha, and Cuzco (see those titles). But the adventurers could not realize, and the Indians themselves probably did not know, how far away the famous temple at Cuzco really was. The facts in the case, the accent of truth in the Indians' accounts, sustained the explorers' confidence year after year; but confident search in a region far removed from the object sought is always "mysteriously" baffling. Long before the report of Pizarro's discoveries in Peru reached the isthmus, a fixed belief had taken possession of the minds of the Spaniards that a kingdom more desirable than any they had despoiled, with gold-adorned temples, was somewhere hidden away in the heart of the continent. The attributes of elusiveness and mystery had become an indispensable part of the conception; therefore the true accounts of the wonderful Temple of the Sun did not exactly tally with the "glittering phantom" of their imagination. After Quesada (see COLOMBIA), starting from Santa Marta, succeeded in penetrating, by way of the Magdalena River, the region of Colombian uplands which lay beyond Dabaiba, naturally the golden temple was sought still further inland; and thus the headwaters of the Orinoco and Amazon were discovered. Bancroft and other writers following his prompting have suggested that an ancient building in the Cenú valley, near which were found tombs containing gold and gems, may have been the temple of Dabaiba; it is quite impossible, however, to accept this conjecture, for the reason that colonists of San Sebastian came upon the Cenú building at an early date, and, if it had been the real object of their search, they would have been able, with the assistance of the natives, to identify it beyond question. See EL Dorado.

MARRION WILCOX.

Dabajuro, Venezuela, a township in the district of Buchivacoa, state of Falcón. It includes a village of the same name near which a severe battle occurred 7 June 1822, in the war for the independence of Venezuela; the Royalists under Morales defeating the Republican

forces. The patriots lost 167 men in the battle, and afterward some of the prisoners, including several officers, were shot, in violation of the treaty of Trujillo.

Dabb, or **Palm-lizard**, an agamoid lizard (*Uromastix acanthurus*), common in the sandy deserts of northern Africa and Arabia.

Dabchick (*Podilymbus podiceps*), a bird of the family *Podicipidae* (q.v.), and the smallest of the grebes, distinguished by the thick bill and absence of cephalic crests. The total length slightly exceeds one foot; the back is brownish black; the belly silvery gray mottled with dusk, but whiter and more silky in winter; the bill bluish in summer, dull yellow in winter. It ranges and breeds throughout tropical and temperate America. *P. fluviatilis* is a closely similar European species. See GREBE.

Dabney, Charles William, American consular officer: b. Alexandria, Va., 19 March 1794; d. Fayal, Azores, 12 March 1871. He was made United States consul in the Azores in 1826, and by his services to the people of the islands made his name a household word among them.

Dabney, Charles William, American college president: b. Hampden-Sydney, Va., 19 June 1855. He is a son of R. L. Dabney (q.v.). He was graduated from the University of Virginia in 1877 and pursued later studies at Berlin and Göttingen. In 1887 he became president of the University of Tennessee, and was assistant secretary of agriculture of the United States 1893-7. In 1904 he was elected president of the University of Cincinnati. He has published among other works, 'History of Agricultural Education in America' (1899); 'Agriculture and Education' (1899).

Dabney, Richard Heath, American historical writer: b. Memphis, Tenn., 29 March 1860. He was educated at the University of Virginia, and has been a professor of historical and economic science there since 1897. He has published: 'The Causes of the French Revolution' (1888); 'John Randolph: A Character Sketch.'

Dabney, Robert Lewis, American Presbyterian clergyman: b. Louisa Co., Va., 5 March 1820; d. 1898. He was a professor in Union Theological Seminary, Virginia, 1853-83, and from 1883 was professor of philosophy in the University of Texas. During the Civil War he served for a time as major in the Confederate army. He published: 'Life of General Thomas J. Jackson' (1864); 'Sacred Rhetoric' (1866); 'Sensualistic Philosophy' (1878).

Dabney, Virginus, American author: b. Elmlington, Va., 15 Feb. 1835. His publication of 'The Story of Don Miff, as Told by his Friend, John Bouche Whacker, a Symphony of Life' (1886), reached its fourth edition in six months. He also published: 'Gold that Did not Glitter.'

Daboia, *da-boi'a*, the generic name of a venomous serpent of the East Indies, known also as Russell's viper (q.v.).

Daboll, dā'bōl, Nathan, American educator and writer: b. about 1750; d. Groton, Conn., 9 March 1818. He wrote the 'Schoolmaster's Assistant' (1799) and the 'Practical Navigator.' He is best known for his share in the universally used 'New England Almanac,' which he began in 1773.

Daboll, Nathan, American writer: b. Connecticut 1782; d. 1863. He was son of the preceding, and compiled the 'New England Almanac' begun by his father. He is the author of 'Daboll's New Arithmetic,' long a terror to the American school-boy.

Da Capo, *dā kā'pō* (It. 'from the head or beginning'), in music, an expression written at the end of a movement, to acquaint the performer that he is to return to, and end with, the first strain. It is frequently used in the abbreviated form D. C.

Dacca, *dāk'a*, or **Dhaka**, *dhā'kā*, India, a commissioner's division in one of the lower provinces of Bengal. It is one of the richest divisions in India, and although containing a good deal of jungle and unoccupied land, produces such quantities of rice as to be called the granary of Bengal. The surface is an uninterrupted flat, and is intersected by two of the largest rivers in the world—the Ganges and Brahmaputra—from whose periodical inundations its extraordinary fertility arises. Dacca was at one time celebrated for its hand-woven muslins, which are of singular delicacy and beauty. This branch of industry, however, is now carried on to a very small extent. The fineness of the yarn or thread used in the making of these muslins is not equal to that in some fabrics of European manufacture, but in durability and delicacy the Dacca muslins excel other muslins. The finest or 'royal muslin' used to be worth about \$5 a yard. For the most delicate varieties only yarns are used that are some years old. Pop. 9,844,127.

Dacca, India, city, capital of the district of the same name, and for 80 years, during the 17th century, the capital of Bengal. It is situated on the river called the Boor Gunga (Old Ganges), at the distance of about 150 miles northeast of Calcutta. In this city and vicinity, the celebrated Dacca muslins are still manufactured to a small extent, and jute works have been established in recent years. It has an extensive manufacture of shell bracelets, much worn by the Hindu women. The city was formerly much more extensive than it is at present, and exhibited a degree of splendor to which it has now no pretensions, as the magnificent ruins of bridges, causeways, caravanseries, palaces, gardens, etc., sufficiently prove. Dacca is considered one of the healthiest and most pleasant places in Bengal. In this city is one of the four hospitals for the insane under the Bengal presidency, and a college maintained at the public expense, in which there is an average of about 340 students, mostly Hindus. Pop. (1901) 90,679.

Dace, a name rather loosely applied to various species of small fresh-water fishes of the minnow family (*Cyprinidae*), but especially to members of the genus *Leuciscus*, of which 22 North American species are discriminated; others belong to *Rhinichthys*, *Notropis*, and *Semotilus*, those of the latter being also called chubs and roach. *Semotilus atromaculatus*, the horned dace, is one of the best known and largest species, and abounds in the small brooks of the eastern half of the United States. As in many of the other species, the upper surface of the head of the male is ornamented during the breeding season with cutaneous tubercles. Because of their abundance the dace are im-

portant as furnishing food for larger fishes, and some of the larger species are much sought by juvenile anglers. The European dace (*Leuciscus vulgaris*) is common in British rivers, as well as in those of France, Germany, and Italy. It prefers deep, clear streams and swims in shoals. See CYPRINIDÆ.

Dacelo. See JACKASS KINGFISHER.

Dach, dāh, **Simon,** German lyricist: b. Memel 1605; d. 1659. His numerous hymns and songs are found in various collections, his hymns especially in the 'Scriptural Arias' of Heinrich Albert. His 'Annie of Tharau,' a Low-German lay for the wedding of his friend Parson Portatius with Anna Neander, became a popular favorite; his 'Praise of Friendship' seems to belong to a better age; and his spiritual songs, 'In Thy Control, O Lord,' 'Be Comforted, my Soul,' etc., are hardly surpassed by any compositions of his day.

D'Ache', Caran, kā-rān dāsh. See POIRE, EMMANUEL.

Dachshund, dāks'hoont (Ger. *dachs*, badger; *hund*, dog), a breed of small German hounds with very long, cylinder-shaped bodies; short, crooked legs; large heads; long pendant ears; and short, stiff, smooth hair. In color these dogs are black-and-tan, or tan with black ears, the former being the characteristic coloring of the best sort. They were originally used in Germany to hunt badgers, and sometimes even in fox-hunting. Though slow in movement, they are possessed of a keen scent, and great power of endurance, rendering them valuable as hunting-dogs when suitably trained. They are much used by sportsmen on the continent of Europe, but their usefulness is impaired by the difficulty of keeping them under proper command. The dachshund is akin to the old English turnspit, and a similar dog is depicted on the ancient Egyptian monuments.

Dacia, dā'shī-ā, in ancient times, a district of uncertain limits to the north of the Danube, inhabited by the Daci or Getæ, afterward a Roman province. It comprised that region now known as Moldavia, Wallachia, and portions of Transylvania and Hungary. For a long time the Daci were formidable enemies of the Romans, and during the reign of the Emperor Domitian obtained so great an advantage that the emperor was compelled to accede to a disgraceful peace. To wipe off this stain Trajan, the second emperor after Domitian, in the year 100 A.D. invaded the Dacian territory, and forced the Dacian king, Decebalus, to accept humiliating terms of peace. These he soon broke; and Trajan entering Dacia a second time, again subdued it, and then erected it into a Roman province, 106 A.D. The Romans remained masters of this province till the reign of the Emperor Aurelian, when, in 274 A.D., they withdrew from the region to the north of the Danube, and assigned to the Roman colonists of Dacia a territory on the south of the Danube lying between Upper and Lower Mœsia, which was hence called Dacia Aureliani. The former Dacia was now successively overrun by the Goths, Huns, Gepidæ, and Avars. Since that time the history of this country, which then lost the name of Dacia, is to be sought for in that of the provinces of which it formerly consisted.

Dacier, André, än'drā dā-sē-ā, French philologist: b. Castres, Upper Languedoc, 6 April 1651; d. 18 Sept. 1722. He studied at Saumur under Tanneguy Lefèvre, whose daughter Anne was associated in his studies. After the death of Lefèvre, in 1672, he went to Paris, and in 1683 he married the daughter of his former teacher. In 1695 Dacier was elected a member of the Academy of Inscriptions and of the French Academy; of the latter he was afterward perpetual secretary. The care of the cabinet in the Louvre was intrusted to him. Besides editions of 'Pompeius Festus' and the 'Œuvres d'Horace, en Latin et en Français, with the Nouveaux Eclaircissements sur les Œuvres d'Horace' (1681-9), and 'The Nouvelle Traduction d'Horace' with critical annotations, he prepared translations of 'Marcus Antoninus,' 'Epictetus,' 'Aristotle's Art of Poetry, with Annotations,' etc.

Dacier, Anne Lefèvre, än lê-fāv, French classical scholar: b. Saumur March 1654; d. Paris 17 Aug. 1720. She was wife of the preceding, and early displayed her learning by an edition of 'Callimachus.' Her learned works were not interrupted by her marriage, which took place in 1683. In her 'Considérations sur les Causes de la Corruption du Goût' she defended Homer with the acuteness of a profound commentator, and Lamotte replied with a great deal of wit and elegance; on which account it was said Lamotte wrote like an ingenious woman, Madame Dacier like a learned man. In her 'Homère Défendu' she showed little mercy to Hardouin, who had written a satirical eulogy of this poet. On this occasion she was said to have uttered more invectives against the reviler of Homer than the poet himself had placed in the mouths of all his heroes. She translated 'Terence' and three pieces of 'Plautus,' in the prologue of which she treats of the origin, the cultivation, and changes of dramatic poetry with acuteness. Her translation of the 'Plutus' and the 'Clouds' of Aristophanes deserves indulgence as the first translation of the Greek comic poet. Her translation of Anacreon and Sappho, with a defense of the latter, met with success. Equally estimable for her character and her talents, she gained as many admirers by her virtue, constancy, and equanimity, as by her works. She was a member of several learned academies.

Dacite, an igneous rock of the diorite family, of porphyritic or compact texture, having crystals of plagioclase felspar quartz and biotite in a glassy or finely crystalline-ground mass. The name is derived from the old province of Dacia, now part of Hungary. Dacites grade into andesites by a lessening of the amount of silica, and differ from rhyolites and trachytes in containing plagioclase rather than orthoclase felspar. A typical dacite shows on analysis the constituent acids and bases in about these proportions: SiO_2 67.2; Al_2O_3 17.0; Fe_2O_3 3.5; FeO 1.2; CaO 4.5; MgO 1.5; Na_2O 3.7; K_2O 1.6. Dacites are found at Lassen's Peak, Cal.; in the Yellowstone Park; in the Eureka District, Nev., and elsewhere in the western United States. See DIABASE.

Dacoits', bands of robbers in the East, especially in Burma, India, where for years they were the terror of the country until the annexation of Burma by the British in 1886.

Da Costa, dā kōs'tā, Izaak, Dutch poet and theologian: b. Amsterdam 14 Jan. 1798; d. Leyden 28 April 1860. Among his works are: 'Prometheus' (1820); 'Poems' (1821-2); 'Gala Songs' (1828); and 'Hagar' (1840).

Da Costa, Jacob Mendes, American physician: b. St. Thomas, W. I., 7 Feb. 1833; d. Villanova, Pa., 11 Sept. 1900. He was graduated at Jefferson Medical College in 1852, practising in Philadelphia. In 1863 he became lecturer in Jefferson Medical College, in 1872 professor of the theory and practice of medicine there, and in 1891 professor emeritus. In 1895 he was chosen president of the College of Physicians and Surgeons in Philadelphia. He wrote: 'Harvey and His Discovery'; 'Medical Diagnosis,' etc.

Dacrocystitis, dāk-rō-cys-tī'tis, an inflammation in the tear-sac. It may result only in the sub-acute swelling of the tear-sac, or it may become purulent, very much inflamed, swollen and painful, and finally discharge pus. Prompt evacuation by surgical means is the safest and best treatment.

Dacrydium, a genus of tall trees, mostly Australian, of the natural order *Taxaceæ*, to which also belong the genera *Podocarpus* and *Taxodium*, important timber and ornamental trees. Several species are of wide utility in ship- and house-building and furniture-making, especially for carved furniture; others yield edible fruits (drupes). A kind of beer is made from the young twigs of some species. The most valued species are probably *D. kirkii*, *D. cupressinum*, and *D. franklinii*, the so-called huon-pine, which is really a yew. They often attain heights of 100 feet and diameters of four feet or more.

Dacryo'ma, a disease of the lachrymal duct of the eye, by which the tears are prevented from passing into the nose, and consequently run over the eyelid.

Dac'tyl, in Greek and Roman versification, a foot consisting of one long followed by two short syllables. In the following line, for example,

Tityre | tu patu | lae recu | bans sub | tegmine | fagi,
the first, second, third, and fifth feet are dactyls. In modern hexameter verse a dactyl is represented by one accented and two unaccented syllables. The word is derived from the Greek *daktylos*, a finger, because a finger has one long and two short joints. See RHYTHM.

Dactyl'iomancy (Greek *daktylios*, a ring, and *mantia*, divination), the pretended art of divining by means of finger rings.

Dac'tylis, or **Orchard-grass**, a monotypic genus of the grass family (*Gramineæ*) native of Europe and Asia. It is naturalized in America, and cultivated as a fodder plant. The flowers are in rounded compressed spikelets at the end of a one-sided panicle. The fruit is loosely enveloped in the glume. The common orchard grass (*D. glomerata*) is often met with in fields and waste places. It is a coarse grass, little relished by cattle in its wild state, but is acceptable in its cultivated state. It grows from New Brunswick south to South Carolina, westward to Kansas, and north to Manitoba. It is sometimes called cocksfoot-grass. See GRASSES.

Dactyl'itis, etymologically, an inflammation of the finger, but generally restricted to an osteomyelitis of the phalanges or metatarsal or metacarpal bones. This may be either tuberculous or syphilitic. In tuberculous form the bone slowly enlarges, the skin becomes reddish, softening takes place, and pus is discharged through a short cavity which leads to dead bone. In its treatment care should be paid to the general condition of the patient. General up-building, by cod-liver oil and other tonics, is necessary. Surgical procedures may be imperative. In the syphilitic form, which usually affects infants, there is as a rule a gummatous deposit in the bones. It resembles the tuberculous forms, but responds to treatment by means of potassium iodide.

Dadayag, dā-dā-yāg', the name of a tribe of the Malayan race, who live in the Cagayan mountains in Luzon. The Dadayags are said to have been cannibals. Their speech differs in some respects from that of any other of the 47 tribes of the Malaysians.

Daddy-long-legs, a name sometimes substituted for the more appropriate term "crane-fly," to designate the small British dipterous insect of the family of *Tipulidæ*, some groups of which are harmless, and dance in the twilight air, while others are injurious to growing crops. They are true flies, though having long legs. In America the name daddy-long-legs is applied only to the harvest-spider, of the family *Phalangidæ*, which is not a fly. The body is very small when compared with the great length of the legs, which contain over 50 joints each. The legs are thought to be organs of sense as well as of locomotion. This harvestman lives on small insects and is entirely harmless to man.

Dado, dā'dō, an architectural term for the middle part of a pedestal, that is to say, the solid rectangular part between the plinth and the cornice; also called the die. In the interior of houses it is applied to a skirting of wood several feet high round the lower part of the walls, or an imitation of this in wall-paper, painting, etc.

Dadu'chus (Lat.-Gr., *dadouchos*), literally a torch-bearer, but applied as an epithet to any of the ancient divinities or other personages when they were represented as bearing a torch or flambeau. Daduchi were also those persons who, in the celebration of the Eleusinia at Athens, carried the sacred torches. The daduchus was inferior to the hierophant, and of equal rank with the keryx.

Dædalion, dē-dāl'ī-ōn, the son of Lucifer, changed, according to the Greek legend, by Apollo into a falcon.

Dædalus, dē-dā-lūs or dēd'ā-lūs, mythical Greek sculptor, the scene of most of whose labors is placed in Crete. According to the common accounts Dædalus lived three generations before the Trojan war, was distinguished for his talents in architecture, sculpture, and engraving, and as the inventor of many instruments; for instance, the axe, the saw, the plummet, the auger; also of glue, and masts and yards for ships. As a sculptor he wrought mostly in wood, and was the first who made the eyes of his statues open. He built the famous labyrinth and a temple of Artemis Britomartis in Crete; and executed for Pasiphaë the noto-

DÆDALUS OF SICYON — DAGHESTAN

rious wooden cow. Being imprisoned with his son Icarus, he invented wings for flying. The wings were fastened on with wax, and Icarus flew so high that the heat of the sun melted the wax, and the wings dropped off, leaving him to fall into the sea, whence the Icarian Sea is said to have received its name. Dædalus himself reached Sicily, on the southern coast of which a place was called, after him, Dædalium. Philologists suppose that Dædalus is not really a proper name, but the common appellation of all the first architects, metallurgists, and sculptors in Grecian antiquity, being derived from or akin to the Greek daidallein, "to work with skill." The mythical Dædalus is sometimes confused with Dædalus of Sicyon.

Dædalus of Sicyon, Greek sculptor who lived about 400 B.C. He is said to have been the pupil, and some authorities say the son of Patrocles. The statue 'Trophy,' at Olympia, erected in remembrance of the victory over the Lacedæmonians, was attributed to Dædalus. Other works credited to him are: 'Two Boys using the Strigil'; 'Cowering' or 'Crouching Venus'; and a number of portrait statues of victors in the Olympian games.

Dæmonelix, a scientific name provisionally given to an extraordinary formation, apparently fossiliferous, extending over a large area in northeastern Nebraska and eastern Wyoming. The soft sandstone of this region has undergone excessive erosion, leaving fantastic figures, some of them 40 feet high. The objects to which the term is especially applied are of various shapes, including gigantic pillars, lower cake-like forms, and columns appearing like fingers and cigars. Those particularly exciting scientific inquiry are spiral and twisted, giving rise to the local name "Devil's Corkscrew." These in some cases resemble huge hop-poles with definite vines running up spirally, or screws with exactly cut threads. In other cases the corkscrew is closely imitated, leaving the spiral without the central pole. So far as the tests have gone, the composing material is found to contain cellular, non-vascular, parenchymatous tissue—a fibre distinguishing it from its stony matrix, and not to be referred to animal but rather to plant origin, and pointing to the cryptogam group.

Daendels, Hermann Wilhelm, hër'män vîl'helm dän'dêls, Dutch general: b. Hattem Gelderland, 1762; d. Africa June 1818. He took part in revolutionary disturbances in Holland in 1787, and was in consequence compelled to seek refuge in France. In the campaign of 1793 he rendered important service to Dumouriez, and was elevated to the rank of a general of brigade. In 1806 he took service under the king of Holland, and from 1808 to 1811 he was governor-general of the Dutch East Indian possessions, and published 'Staat der Nederlandsche Oost-Indische Bezittingen' (1808-11). On the overthrow of Napoleon, the new king of Holland, William I., intrusted Daendels with the organization of the Dutch colonies on the coast of Africa, and there he died.

Dâet, dâ'ät, Philippines. 1. City of Luzon, in the province of Ambos Camarines, situated between the Dâet River and one of its branches. It is a radiating point of several roads, a port of entry. It was the capital of the Spanish province of Camarines Norte. Pop. 10,650. 2. A river

which enters the sea near the town of the same name.

Daffodil (corrupted from the Latin *asphodelus*), the English name of those species of *Narcissus* which have a large bell-shaped corona. The common daffodil (*N. pseudo-narcissus*) is a native of England and of nearly all parts of Europe, growing in woods and hedges, and often cultivated in gardens, where it not unfrequently becomes double. In gardens many varieties of it are among the most esteemed of early flowers.

Dagami, dâ-gä'mê, Philippines, town in the province of Leyte, on the Binahaan River, 16 miles south-southwest of Tacloban. Pop. 25,000.

Däge, Eduard, êd'ooärd dâ'gê, German historical painter: b. Berlin 10 April 1805; d. there 6 June 1883. He was a pupil of Neiderlich and Wach, finishing his studies in Italy. Besides his religious paintings Däge was remarkable for his genre pictures of small size. His chief works are found in the churches of Rostock and Sigmaringen, and in the chapel of the Château at Berlin. His 'The Old Sacristan' and the 'Discovery of Painting' hang in the National Gallery at Berlin. Among his other works are many altar pieces for churches: 'The Paræ' and 'Woman and Child,' in the Raczyński Gallery in Berlin; 'Initiation of a Nun'; 'Shelter at the Altar'; 'Charitable Monk'; 'Roman Woman and Child.'

Dagger, a weapon resembling a short sword, with a two-edged, sometimes three-cornered, sharp-pointed blade. In the feudal period it was carried by knights in addition to their sword; and in single combat it was wielded in the left hand, and used by them to parry the blows of their adversaries, and also to despatch a vanquished opponent, unless he begged for quarter, whence it was called the "dagger of mercy." A kind of dagger known as a dirk was formerly used by the Scottish Highlanders, and is still regarded as an essential part of a Highland costume. The dagger has been regarded as especially the weapon of assassins. In printing, a dagger (†) is often used for the second reference on a page when there is more than one.

Dagger-moth, a common name given to both *Acronycta* and *Apatala*, genera of nocturnal moths, which feed upon the leaves of orchard trees and small fruits. *Acronycta* has fore wings varied with dagger-like black marks. *Apatala* has gray fore wings margined with black dots and transverse lines. The caterpillar is of a velvety black color, and is beautiful. It changes into the pupa by wrapping itself in leaves bound with a silken thread.

Daggett, Mary Stewart, American writer: b. Morristown, Ohio, 30 May 1856; married Charles Daggett in 1875. She has published: 'Mariposilla' (1895); 'The Broad Isle' (1899).

Dagh, a Persian word signifying mountain; hence Daghestan, land of mountains.

Daghestan, dâ-gês-tân', Russia, province in the Caucasus, stretching along the west side of the Caspian Sea; area, 11,036 square miles. Its fertile and cultivated valleys produce good crops of grain, silk, cotton, flax, and tobacco.

DAGNAN-BOUVERET — DAGUERRETYPE PROCESS

The inhabitants are chiefly Mohammedans, of Tartar and Circassian origin. Capital is Derbend. Pop. 601,987.

Dagnan-Bouveret, Pascal Adolphe Jean, pās-kal ä-dōlf zhōn dān-yān boov-rā, French painter: b. Paris 7 Jan. 1852. He was a pupil of Gérôme, and recipient in 1874 of the second "Grand Prize of Rome." He soon broke with the style of Gérôme and showed the influence of Bastien Lepage. His picture of the death of Manon Lescaut, which took the medal of the third class at the Salon of 1878, showed him to be in possession of an original and particularly individual style of painting. 'A Wedding Party at the Photographer's,' exhibited in the Salon of 1879, was much admired for composition and technique. But this style was too close to caricature and was soon abandoned. In the Salon of 1880 he displayed a much more serious form of talent. His picture 'An Accident,' which took the medal of the first class that year, remains one of his masterpieces, being greatly admired for the truth of its types and expressions. These early works ranked him among the most keen portrayals of our modern manners. 'The Blessing of a Young Couple before Marriage' (1882) bore the stamp of extraordinary poetical feeling which his later paintings, illustrating, for the most part, the life, customs, and costumes of Bretagne, served to accentuate. In his 'Hamlet and the Grave Diggers' the artist is himself represented as the moody Danish prince. Among his best-known works are: 'The Consecrated Bread,' in the Luxembourg; 'The Virgin'; 'The Bretons at the Pardon' (1887); 'The Breton Peasant' (1888); 'The Cemetery of Side Kebir'; 'The Conscripts'; 'The Lord's Supper' (1896), a very great work; 'The Horses at the Watering Trough' and two portraits of de la Rochetaille and Gustave Courtois. Very modern in his taste for individuality, he resembles the great masters in the touching simplicity of his feeling, and the idealism which is evolved from his strong realism and illumines it. See Stranahan, 'History of French Painting' (1899); Van Dyke, 'Modern French Painters' (1896).

Dago, dāg'é, or **Dagden**, Russia, an island included in the government of Esthonia. It is situated to the southwest of the entrance of the Gulf of Finland, and has productive fisheries. The soil is mostly poor, and the coast rocky. The inhabitants include many Swedes. Pop. about 16,000.

Dag'oba, in Buddhist countries and those which at one time held the Buddhist faith, a massive erection containing relics. The word is said to be derived from *dā*, *dātu*, or *dhātu*, a relic, and *geba* or *garbha*, the womb. They are built of brick or stone, are circular in form, and are erected on natural or artificial mounds, while the stone or brick structure itself sometimes rises to an immense height. The contents of a dagoba usually consist of stone or metallic vessels of various shapes and sizes. One of the articles is usually a silver casket, with a gold casket, often highly wrought with chased work on the surface and set with precious stones, and this second casket is either enclosed in the first or lying beside it with the rest of the objects. Some of the smaller articles, such as pearls, gold, buttons, rings, beads, etc., are sometimes contained in these caskets, which are in some cases

scratched on the surface with a peculiar character. These dagobas have always been held in the highest veneration by the Buddhists, and a common mode of testifying their veneration is to walk around them, repeating prayers the while. Some remarkable dagobas are to be seen at Anuradhapura, in Ceylon.

Dagobert (dāg'ō-bért or dā-gō-bār) I., king of the Franks: b. about 600; d. Epinay 638. In 628 he succeeded his father, Clothaire II., who had acquired the divided members of the Frankish empire. He waged war with success against the Slavonians, Gascons, and Bretons; but stained the splendor of his victories by cruelty, violence, and licentiousness. After he had conquered the Saxons, it is said that he caused all those whose stature exceeded the length of his sword to be put to death. He deserves praise for his improvement of the laws of the Franks. He was buried in St. Denis, which he had founded.

Dagon, a deity of the Philistines, whose image is generally believed to have been in the form of a triton or merman, with the upper part human and the extremities, from the waist downward, in the shape of the tail of a fish. From this latter circumstance the name is derived, from the Hebrew *dag*, a fish. Dagon and his temple are mentioned in Scripture, more especially in 1 Sam. v. 4. Milton alludes to him in describing the infernal senate in 'Paradise Lost.'

Daguerre, Louis Jacques Mandé, loo-ë zhāk mǎn-dā dā-gār, French inventor: b. Cormeilles, Seine-et-Oise, 18 Nov. 1789; d. Petit-Brie, near Paris, 10 July 1851. He was at first a scene-painter at Paris, and while engaged in painting panoramic views, he discovered a method of representing moonlight, day and night, changes of season, and so on, by the proper illumination of a large transparent canvas painted on both sides. (See DIORAMA.) The pictures were first exhibited in Paris in 1822. On 19 Aug. 1839 his successful completion of photographic printing was announced to the Academy by Arago. As early as 1814 Nicéphore Niépce had directed his attention to photography, and in 1827 had delivered pictures on metal to the Royal Society. In 1826 he had been joined by Daguerre, and on 14 Dec. 1829 a formal agreement was made between them. Niépce died 5 July 1833, and had apparently before his death given up the hope of succeeding with a plate sensitized by iodine. Daguerre, however, persevered, and at length produced the method which has been since called daguerreotype. See DAGUERRETYPE PROCESS.

Daguerreotype (da-ger'-ō-tip) Process, one of the earliest methods known for fixing the image afforded by the camera, and thus producing permanent pictures, or "photographs." As practised by Daguerre, the method consists in exposing a silver plate to the action of iodine vapor until a sufficient coating of iodide of silver is produced upon it, and then allowing the image in the camera to fall upon it for a time varying from three minutes to an hour or more, according to the nature of the subject and the intensity of the light. The plate is then submitted to the action of the vapor of mercury, which condenses most upon the parts where the light has acted most, and in this way greatly increases the distinctness

of the image. The plate, after development by mercury vapor in this way, is immersed in a solution of hyposulphite of soda, which dissolves those parts of the iodide that have not been affected by light, and thus renders the picture permanent. Daguerre made the details of his process public in 1839, and for this he was awarded a pension by the French government. Important improvements in the method were soon made. The iodide of silver is so feebly sensitive to light that Daguerre, in his public demonstration of 17 Sept. 1839 gave his picture an exposure of 1 hour and 12 minutes. In December 1839, before the first French photograph by the iodine process had been received in the United States, Dr. Paul Beck Goddard of Philadelphia discovered that iodine could be advantageously replaced by bromine, an element discovered by Balard 13 years before. By the use of bromine, the sensitiveness of the plate was increased so greatly that Dr. Goddard obtained some practically instantaneous views. The earlier method had been tried for portraiture, but, owing to the great exposures required, the results were described by a newspaper of the time (and no doubt with reason) as "most terrific facsimiles of the human visage." Upon the substitution of bromine for iodine, or the use of bromine in conjunction with iodine, the exposures were reduced to more reasonable lengths, and the pictures that were obtained were much less "terrific." Early in 1840 Robert Cornelius, of Philadelphia, fitted up a room exclusively for portraiture, and this was the first photographic studio in the world. The expensive silver plates were afterward replaced by plates of copper that had been heavily electroplated with silver, and a method of toning the pictures by the use of chloride of gold was also devised. Daguerre was associated, in his experimental work, with Nicéphore Niépce, who had previously discovered the bitumen process (q.v.) of taking photographs; and many authorities maintain that Daguerre took unfair advantage of his partner, and published, as his own, processes for which Niépce should have had equal credit. However this may be, it is certain that Niépce died in 1833, some years before Daguerre produced any pictures by the method that now bears his name; and it would appear that Daguerre is at least entitled to the sole credit for the discovery of mercury as a developing agent. The way in which this discovery came about is of deep interest, and as the legend was cited by Professor Liebig as one of the finest examples of the inductive method of reasoning, it may perhaps be received with some degree of confidence in its authenticity. Daguerre had discovered that iodide of silver is affected by light, and he had repeatedly iodized silver plates and exposed them in his camera, with the result that feeble images were obtained. He was filled with hope that some way might be found to intensify these images, but he worked for years without success, and Niépce died with a feeling of regret that they had wasted so much time upon a method that was apparently incapable of yielding the results that they sought. On one occasion, after the death of Niépce, Daguerre removed one of his old plates from a closet in which it had been stored, and was about to repolish it and use it over again in a new experiment, when he observed that the view to which it had been previously exposed,

and which showed but faintly when he had put the plate away, was now strong and clear. Without disturbing anything in the closet, he prepared a new plate, sensitized and exposed it as before, and placed it in the closet for a similar time. The same intensification of the image was observed. He concluded that the developing agent that he had sought so indefatigably was present in his closet, but he had no idea what it could be. To identify it, he prepared and exposed plate after plate, each time leaving the plate where the first one had stood, but each time removing one article from the closet. The pictures still developed, even when the last thing had been apparently removed. He found, however, that some mercury had been spilled in the closet, and being driven to the conclusion that this was the mysterious agent sought, he tried it, and his mercury-development process was the result.

Dagun, a god worshipped in Pegu. According to Indian mythology, when Kiakiak destroyed the world, Dagun reconstructed it.

Dagupan, dā-goo-pān', Philippines, a town in the province of Pangasinan, Luzon, situated on the Lingayen River where it enters the gulf of the same name, about 130 miles northwest of Manila, on the Manila & Dagupan Railroad. It is an important road centre, and has a large trade. It was one of the strongholds of the Filipino insurgents and the point where most of the filibustering expeditions landed. Soon after hostilities between the United States and the insurgents opened, the American military authorities were unanimous in the opinion that Dagupan should be made a base of operations, but sufficient troops were lacking till November 1899, when an expedition left Manila for this place under command of Gen. Wheaton. A landing from the transports, supported by a number of naval vessels, was made at Lingayen, a suburb of Dagupan, which has a sheltered harbor and had hastily constructed earthworks. The works and town were shelled, but there was no response from shore. As the American troops were being landed in steam launches a long line of insurgents suddenly appeared among the sand dunes and fired upon the troops. The Americans returned the fire, completed their landing, and drove the insurgents out of Dagupan, and then started on a march to the east and south in the expectation of surrounding Aguinaldo at Tarlac, where he had established his headquarters.

Dahabieh, dā-hā-bē'ē, a barge-like boat used on the Nile for conveyance of travelers. It varies considerably in size, has one or two masts, with a very long slanting yard on each mast supporting a triangular or lateen sail, and accommodates from two to eight passengers. Wealthy travelers often hire one of these vessels for a trip up and down the river, the voyage to the First Cataract and back, under the most favorable circumstances, occupying seven weeks, and three weeks more if prolonged to the Second Cataract.

Dahl, Johann Kristen Clausen, yō'hān krīs'ten klow'sēn dāl, Norwegian landscape painter: b. Bergen, Norway, 24 Feb. 1778; d. Dresden, 14 Oct. 1857. His talent displayed itself early and he studied at the Academy of Copenhagen 1811-18. He then went to Dresden, where from 1821 onward, he was professor of

painting in the Art Academy. Among his works are: 'Storm at Sea' (1823); 'Winter Landscape.' He was a prolific painter and his works are found in many European galleries. See Aubert, 'Maleren Professor Dahl' (1892-4).

Dahl, Konrad Neuman Hjelm, *kön'råd noi'mán hyëlm*, Norwegian poet and novelist: b. Drontheim 24 June 1843. He is author of a series of stories and novels of Norwegian and Lapp life, with much insight into nature and into the heart of the people. Most notable among them are: 'The Finnish Youth' (1873); 'The Lion' (1874); 'Eda Mansika' (1875); 'The Voyager in the Icy Sea' (1878).

Dahl, Michael, Swedish painter: b. Stockholm, Sweden, 1658; d. London, England, 20 Oct. 1743. He was taught painting by Ernststræen Blocker; later studied in France and Italy; and settled in London in 1688, where he had a very successful career. During the reign of Queen Anne and George I. he acquired an extensive patronage among the nobility and at court. His coloring is good and the accessories are rendered honestly, though in rather a tasteless style. He did not display either originality or genius, but was content to portray his patrons as he found them.

Dahlak, *dä-läk'*, a group of three islands, with many smaller rocks, in the Red Sea, off the Bay of Massowah. They were famous in Roman times for their pearl-fisheries, but the beds have long since been exhausted and abandoned. The inhabitants number about 1,500, and are under the rule of a sheik holding authority from Egypt. They carry on a trade with the Arabian coast.

Dahlgren, däl'grën, Fredrik August, Swedish poet and dramatist: b. Nordmark 20 Aug. 1816; d. 1895. He wrote many dialect songs and ballads, collections of which were published in three volumes (1876). These have attained an extraordinary degree of popularity. Of his dramas many have been very successful; his 'Vermlandingarne,' a musical drama (1846), had more than 100 consecutive representations. He translated a great many dramas from foreign languages, and wrote a history of the Swedish stage.

Dahlgren, däl'grën, John Adolf, American naval commander: b. Philadelphia, Pa., 13 Nov. 1809; d. Washington, D. C., 1870. In 1826 he entered the navy of the United States as a midshipman, in 1837 was advanced to the rank of lieutenant, and in 1855 to that of commander. From the year 1847 he was employed on ordnance duty, and invented the cannons which are called after him Dahlgren guns, besides contriving a more effective method of arming gunboats with 12 to 24 pounder howitzers, throwing canister-shot and shrapnel-shells. At the outbreak of the Civil War he was commander of the naval station at Washington; in July 1862 he undertook the supreme command of the South Atlantic squadron; and after the death of Admiral Foote in 1863 was appointed to the command of the fleet stationed before Charleston. He is the author of 'Thirty-Two Pound Practice for Ranges' (1850); 'Systems of Boat Armament in the United States Navy' (1852); 'Naval Percussion Locks and Primers' (1852); 'Ordnance Memoranda' (1853); and 'Shells and Shell-guns' (1856). Consult 'Memoir of John A. Dahlgren' (1882).

Dahlgren, däl'grën, Karl Fredrik, Swedish poet and humorist: b. Stens-Bruk, East Gothland, 20 June 1791; d. Stockholm 2 May 1844. He excelled in descriptions of nature and in the idyllic burlesque. Many of his songs and ballads have a permanent place in the treasury of Swedish popular songs. For years he published a 'Muses' Almanac,' containing his stories and comic sketches. His novel 'Nahum Fredrik Bergström's Chronicle' (1831) is a work of distinguished merit.

Dahlgren, däl'grën, Madeleine Vinton, American author: wife of Rear-Admiral Dahlgren; b. Gallipolis, Ohio, about 1835; d. Washington, D. C., 28 May 1898. She was married in 1865 to J. A. Dahlgren (q.v.). Her works include: 'Idealities' (1859); 'South Sea Sketches' (1881); 'Etiquette of Social Life in Washington' (1881); 'Memoirs of John A. Dahlgren' (1882); 'The Lost Name'; and 'Lights and Shadows of a Life' (1886). For her Spanish translation of Donoso Cortes' 'Catholicism, Liberalism, and Socialism,' she received the thanks of Pius IX.

Dahlgren, Ulric, American military and naval officer: b. Bucks County, Pa., 1842; d. 4 March 1864. He was a son of Rear-Admiral J. A. Dahlgren (q.v.). At the outbreak of the Civil War he became aide, first to his father and later to Gen. Sigel, and was Sigel's chief of artillery at the second battle of Bull Run. He distinguished himself in an attack on Fredericksburg and at the battle of Chancellorsville, and on the retreat of the Confederates from Gettysburg he led the charge into Hagerstown. He lost his life in a raid undertaken for the purpose of releasing national prisoners at Libby prison and Belle Isle.

Dahlgren Gun (named from Rear-Admiral John A. Dahlgren), a gun in which the front portion is materially lightened and the metal transferred to the rear, giving the "bottle-shape," which caused some surprise on its first appearance in Europe. Col. Bomford, chief of ordnance of the United States army, began making this experiment previous to the War of 1812, and gave the name of "Columbiad" to the piece.

Dahlia, *dä'li-a*, a genus of perennial herbs of the natural order *Composita*, closely related to the genera *Bidens*, *Coreopsis*, and *Cosmos* (q.v.), which are distinguished by technical characters. Indeed, *Cosmos diversifolius*, or black cosmos, is well known to American gardeners as *Bidens* and *Dahlia*. The true dahlias are much confused as to nomenclature, only about 10 well-authenticated species being recognized out of a large number of synonyms. With few exceptions (Central American species) they are natives of Mexico. Six species are cultivated, but only one of these (*D. variabilis*) and its apparent sub-species, *D. juarezii*, are of wide horticultural importance. The former has given rise to several thousand horticultural varieties since 1814, when well-marked double varieties first appeared; the latter, which was introduced about 1879, has produced a considerable number popularly known as cactus dahlias. There are also many single varieties. Considering the short time the dahlias have been in cultivation (since 1879) they have attained a very high rank as a garden plant, being numbered among a dozen plants to have special societies and

exhibitions, both in Europe and America. Besides the cactus forms, which are less formal than the earlier double varieties, there are many forms and sizes ranging in color from white to yellow and deep red, but deficient in the shades of blue.

The plants may be propagated by seeds for obtaining new varieties, by division of the underground parts, or commercially, by cuttings. They succeed well in almost any good soil, the tubers or the young plants being set in beds as soon as danger from frost is past. When frost has killed the tops in the autumn the plants are dug and the tubers stored in a cool, dry cellar until spring, or until they are needed for obtaining cuttings, when they are placed on greenhouse benches and forced. Few pests attack the plants.

Consult: Bull. No. 47, Missouri Experiment Station; Peacock, 'The Dahlia,' and other literature mentioned in article 'Dahlia' by Bailey in 'Cyclopedia of American Horticulture' (New York 1900-2).

Dahlin, dā'līn, a white substance, also called inulin, obtained from the pounded tubers of the dahlia. The juice is pressed from the tubers, clarified by standing, mixed with an equal bulk of strong alcohol, filtered, and then with two other volumes of alcohol. Inulin precipitates, and is washed and dried. It is a white starchy powder, with distinct crystalline character; it has no taste or smell, is hygroscopic, but sparingly soluble in water, until it passes into a non-crystalline modification. The tubers pounded and distilled with water yield a strongly smelling, sweetish ethereal oil, which is heavier than water, but becomes buttery and semi-crystalline in it. The tubers also contain a fixed oil and salts of organic acids. The coloring matter of the purple dahlia is very sensitive to acids, which turn it red, and to alkalies, which turn it green. When extracted by water or alcohol, and paper steeped in it, it forms Georgina paper, and is used as a chemical test instead of red and blue litmus paper.

Dahlmann, Friedrich Christoph, fräd'rīh krīs'tōf dāl'mān, German historian: b. Wismar 13 May 1785; d. Bonn, Prussia, 5 Dec. 1860. He studied at Copenhagen and Halle; in 1812 was appointed professor extraordinary of history at Kiel, and in 1829 accepted a call to fill the chair of political science in the university of Göttingen. There he continued his historical studies, but did not on that account altogether abandon the domain of politics. He contributed in great measure to the establishment of the constitution of Hanover in 1833, and was a vigorous advocate of liberal principles. In 1842 he was appointed to the chair of history in the university of Bonn, where he gave himself up entirely to literary pursuits. The revolution of 1848 recalled him to public life. He was sent as a deputy to the diet of the confederation, had a share in elaborating the constitution called that of the "Seventeen," and became one of the chiefs of the constitutional or parliamentary party. He was afterward a member of the Prussian chamber of deputies, in which he set himself to withstand the reactionary movement which followed the troubled period of 1848-9; but finally renounced politics entirely, and devoted the remainder of his life to literature. He left a large number

of works, all characterized by great depth, an accurate understanding of the events he relates, and a thorough knowledge of men. Among these are his 'Quellenkunde der deutschen Geschichte' (1830); 'Geschichte Dänemarks' (1840-3); 'Geschichte der englischen Revolution' (1844); and 'Geschichte der französischen Revolution' (1845). See Springer, 'F. C. Dahlmann' (1870-2).

Dahlonga, dā-lōn'ç-ga, Ga., county-seat of Lumpkin County, about 20 miles north by west of Gainesville, on one of the branches of the Chattahoochee River, among the foothills south of the Blue Ridge Mountains. It is the seat of the Georgia Agricultural College. The town is the centre of the richest gold mining region east of the Mississippi River. The town was first settled in 1831 by gold miners. The principal industries are those connected with the mining and refining of gold. Pop. (1900) 1,255.

Dahn, dān, Julius Sophus Felix, German historian: b. Hamburg 9 Feb. 1834. He was professor of jurisprudence successively in the universities of Munich, Würzburg, Königsberg, and Breslau. Among his historical works are 'The Kings of the Germans' (1861-71); 'Geschichte der deutschen Urzeit' (1883-8). He is the author of many treatises on the jurisprudence of the ancient Germans, and the civil and criminal law and procedure of modern German states. He has also written epics and lyrics. Of the former may be named 'Herald and Theano' (1856); of the lyrics, 'Ballads and Songs' (1878). He is author also of the dramas: 'König Roderich'; 'Sühne'; etc., as well as several romances.

Dahomey, dā-hō'mī or -mā (native name of the people, *Dauma* or *Dahomé*), a French protectorate in western Africa, bounded on the east by the British possessions of Nigeria and Lagos, on the south by the Gulf of Guinea, on the west by Togoland (German), and on the north by the French military possessions; area about 60,000 square miles, having been increased in 1900 by territory in the north, adjacent to the Niger. The coast line is only about 70 miles in length. About midway on the coast lagoon is the port of Whydah, whence a road extends inland to Abomey, a distance of 65 miles. Dense forests and dismal swamps cover nearly two thirds of this distance, but from the Great Swamp of Agrimé vast undulating plains rise for many miles in the direction of the Kong Mountains. The Avon and Denham lagoons receive the rivers, which are not very important. The soil is extremely fertile. Among native trees are the baobab and the cocoanut palm. Groves of oil-palms encircle each town, and palm-oil is made in large quantities. Maize, beans, and peas, as well as cassava, yams, sweet potatoes, limes, oranges, pineapples, and other tropical fruits grow in luxuriance; cotton, sugar, and spices of all kinds are also grown, and sheep, goats, swine, and poultry are raised, though not in large numbers.

In 1901 the imports, which consisted chiefly of liquors, tobacco, and cotton goods, were valued at \$3,150,130; and the exports, which were chiefly palm-oil and palm kernels, \$2,095,763. Some cotton cloth is made in the country, and weapons and tools are forged from native iron. There are few roads in the country.

DAIBUTSU—DAIRY CATTLE

In 1902 a railway was constructed from the port of Kotonu into the interior. A telegraph line connects that port with Abomey, the Niger and the Senegal. There were 950 miles of telegraph and 100 of telephone line in 1903. The currency consists of cowrie shells and French, English, and American coins. The colony is administered by a lieutenant-governor with an administrative council.

Daibutsu, dī-boo'tsoo, the name given in Japan to a gigantic statue of Buddha. The largest Daibutsu in the empire is found at Nara (q.v.). It is 53 feet high and supposed to date from the 8th century. The image is shrined in a pagoda. At Kamakura (q.v.) is a bronze Daibutsu over 49½ feet in height. The eyes, which are four feet long, are made of gold.

Daillé, Jean, zhōñ dā-yā, French Protestant theologian: b. Châtelherault 6 Jan. 1594; d. Charenton, near Paris, 15 April 1670. He became pastor in 1625 of the church at Saumur, and in 1626 of that of Charenton at Paris, where he passed the remainder of his life. He was one of the ablest and most learned divines of his day, and did essential service to the Protestant cause by several works, among which the most celebrated is entitled 'Traité de l'emploi des SS. Pères pour le Jugement des Différends de la Religion' (1632). It was also published in Latin and translated into English, and in both forms has had a very extensive circulation both in England and on the continent. It aims to show that the authority of the fathers has been far too much overvalued, and that the ignorance or inaccuracy apparent in almost all their works unfit them for the establishment of any doctrine not clearly laid down in Scripture. He also wrote distinct treatises on several of the leading points of controversy between Protestants and Roman Catholics.

Daimiel, dī-mē-ēl', Spain, town in the province of Ciudad Real; about 20 miles east-northeast of the town of Ciudad Real on the Azuer River. It is well built; the principal edifices are two parish churches, the one Gothic, the other Doric, and both surmounted by towers. The manufactures consist chiefly of linen and woolen fabrics, and lace, and the trade is chiefly in grain, cattle, wine, and wool. Pop. 11,850.

Daimios, dī'mē-ōz, a class of feudal lords formerly existing in Japan, but now deprived of their privileges and jurisdiction. As long as their feudal possessions remained to them, they exercised in their own domains the rights of petty rulers, and 18 of them were to all intents and purposes independent; a circumstance which greatly limited the power of the mikado, and formed a hindrance to the career of progress and reform on which Japan had entered. In order to centralize the power of the government, a decree was issued on 12 Aug. 1871 by which the daimios were deprived of all rights of sovereignty, their districts incorporated with the imperial territories, and their troops handed over to the imperial government. At the same time a new constitution and organization were given to the state. A deliberative assembly, consisting of two chambers, was created, to which deputies were sent by the former feudal governments or districts of the daimios (Han); and the daimios themselves were made official governors of those districts which they previously held as feudal rulers, and were placed

upon a salary hereditary in their families. The yearly sum allotted to the payment of their salaries is equal to one tenth of their former income.

Dair-el-Kamar, dīr-ēl-kā'mār, Syria, the chief town of the Druses, on a slope of Mount Lebanon, 12 miles southeast of Beirut. It is accessible only by two narrow paths. It was once a flourishing place, with important manufactures of gold and scarlet cloth, but it is now greatly decayed. The only remarkable buildings are a large khan, a palace which formed the old serai of the emir of Lebanon, a Maronite convent, and several churches. Pop. 8,000.

Daircell, Saint, said to have lived in Kerry, Ireland, in the 7th century. The legend is that he was the illegitimate son of a husbandman, and that the mother sought to kill the child at birth. A fluttering white dove, which seemed to descend from heaven, stayed her hand, and saved the life of the babe. The legend says further that the dove covered the child with its wings, "gathered him to her in her wings," whence the name, Daircell, "a gathering."

Dairy Cattle, the name given to the neat cattle raised for their milk, rather than for their flesh, the latter being called beef cattle. Man has, by careful attention, prolonged the natural period of milk-flow and increased the quantity much beyond the needs of the calf. This is drawn from the cow by the milking process familiar to most people; and the value of the cattle depends upon the quantity and richness of the milk produced, more than upon any other feature. Naturally, however, the more robust breeds, and those that can do well on comparatively coarse food, are most useful in certain sections of country subject to extremes of temperature, and producing inferior fodder-grass.

Though dairy cattle are bred almost all over the civilized world, the stock of the best breeds comes from the British Isles, Holland, and Switzerland, the two last named countries being justly famous for their rich milk and fine cheese.

In America, almost all breeds of cattle are represented, and experiments have been made and statistics gathered under the supervision of government, as to the breeds that thrive best in the various agricultural districts. According to the reports of the United States Department of Agriculture these are the Brown Swiss, which, as its name signifies, is of Swiss origin; the Dutch Belted, and Holsteins, two breeds from Holland; and the Ayrshire, Devon, Guernsey, Jersey, and various breeds of Durham from Great Britain.

Dairy cattle are usually somewhat less heavy than beef cattle; and, except in rare cases, are extremely gentle. They should be well cared for, and kept in as cleanly a manner as possible, as such care is fully repaid by both the amount and condition of the milk produced.

The Brown Swiss is a breed of medium size, fleshy, well-proportioned, with a straight, broad back, heavy legs and neck, and a somewhat coarse appearance. Despite this, however, these cattle are rather small-boned, have fine silky coats, and rich elastic skin. The color is brown, shading into a soft mouse color, or dun, on the body, with head, neck, and legs very dark, often almost black. The nose, tongue, hoofs, and switch are quite black. There is a light-colored stripe around lips and nostrils, a tuft of light

DAIRY INDUSTRY

hair between the horns, and a similarly colored stripe along the tail. The eyes are full, gentle, very bright, and usually black. The small horns are white, tipped with black, and curve forward and inward. The ears are good-sized, and round, and lined with light-colored, silky hair. The udder is large, and quite white. The average weight is from 1,200 to 1,400 pounds, the bulls sometimes attaining greater size and weight. Both bulls and cows are hardy and active, and, owing to their origin, thrive well in mountainous regions. The bulls are just as docile as the cows, and even in big herds, are easily managed.

The Dutch Belted are gentle, vigorous cattle, with rather longer legs and less bulky bodies than other breeds, and are easily known by the broad belt of white encircling the body, between hips and shoulder blades, forming a marked contrast to the jet-black, glossy coat of the remainder of the body. No white should appear on the black portion, and on the white belt there should be no black spot.

The second Dutch breed, the Holstein-Friesian, is characterized by great size, and by the black-and-white coat. The ground-color is usually jet-black, of a silken texture, with marks of pure white upon it. These do not merge gradually into the black, but are clearly outlined patches. The horns are small, usually white, tipped with black. The tail is tipped with a white brush. Though the largest and heaviest of dairy cattle, the Holsteins are not so easily satisfied with coarse food, nor so hardy as many other breeds; and they are large feeders.

The British breeds are varied. The Ayrshire is the breed best suited to rugged uplands, pastures, and inclement weather. These cattle, generally under the average in weight, are short-legged, small-boned, and alert. The horns are gracefully curved, generally upward; the eyes are unusually bright. The color is red and white in spots; the red sometimes varying to a rich brown. The coat is always glossy; and the intelligence, economy, and large yield of milk make this a favorite breed.

The Devon, considered the most beautiful of dairy breeds, is a red-coated, smooth-skinned animal, active, hardy, symmetrical, and intelligent. Though the typical red may vary in tone, being sometimes pale, sometimes dark, no markings of white or black appear, save one patch of white on and in front of the udder. The females have beautiful, creamy, black-tipped, pointed horns, curving upward. The males have shorter, thicker, and less graceful horns.

Guernseys, as their name signifies, originated in the island of Guernsey in the English Channel. They are yellowish in color, often with patches of white on the body and legs. The ground color is deepened almost to brown in many cases. The horns are small, fine, and graceful, often yellowish from the base. This breed secretes a large amount of yellow coloring-matter, noticeable in the animals themselves, and very prominent in the golden color of the butter made from their milk. Guernseys are nervous, and yet with care may be kept quite gentle.

The Jerseys, from the same group of islands as the former breed, are smaller than any other breed of dairy cattle. In color these animals are rather variable, ranging through shades of brown to black, yellow, tan, or cream, either

solid color, or broken, patches often being white. The horns are small and crumpled, the eyes soft and gentle. Jerseys are much less fleshy than most other breeds, and are sharper in outline. They are light, quick, and rather graceful in motion; and are second only to Guernseys in the richness and color of their milk. There is an unmistakable, though indefinable, air of breeding about a Jersey that invariably shows.

The Durham cattle are of various breeds. They are all short-horned or quite hornless; are red in color, sometimes marked with white; have heavy bodies, and short, broad heads. They are usually classed as beef cattle; but are so capable of giving good milk in large quantities that they are often bred for dairy purposes. They are exceedingly docile, even the great bulls, which attain a weight of 2,500 to 3,000 pounds, being thoroughly domesticated.

Dairy Industry, American. Compared with other farming and agricultural industries in the United States, dairying is one of considerable import and shows great development during the last two or three decades. The industry is most prominent in sections where natural advantages are the greatest. According to government statistics, the leading dairy States are Vermont, Connecticut, Massachusetts, New York, New Jersey, Pennsylvania, Ohio, Michigan, Indiana, Illinois, Wisconsin, Iowa, and Minnesota. Butter is made in all these States, while New York, Wisconsin, and Ohio are the heaviest producers of cheese, the varieties including imitations of many foreign cheeses. Dairy farms are rapidly developing in sections where wheat and other "general" crops have become unprofitable. The industry has recently made great advances in North and South Dakota, Nebraska, Kansas, Missouri, and the Pacific Coast States, also in the Southern States where only a few years ago it was hardly known. The old belief, that dairy operations could be carried on only within narrow limits, comprising those few States wherein the industry originated in this country, exists no longer. It has been proved that cows can be kept and good butter and cheese can be made in almost any district where suitable coarse fodder can be produced. It is often possible to grow more abundant and better fodder crops than are furnished by the natural grasses. Well or cistern water may take the place of the flowing spring. Freight rates and fast refrigerator-car transportation lines have the effect of placing the distant dairyman near the markets where grains can be purchased and his products can be disposed of to the best advantage. Dairying seems to be the one branch of agriculture least affected by conditions of soil and climate.

Dairying has many advantages over other kinds of farming. It improves the land instead of wearing it out, because the products of the dairy which leave the farm permanently are not rich in plant food, as is the case with field crops, and it provides fertilizer in the form of manure which is of immense value for enriching poor soil. It furnishes a profitable way of using certain farm products, such as grass and straw, that otherwise would be valueless. It provides a cheap by-product in the form of skimmed milk or whey, which can be very profitably fed to calves and other animals. It can be combined

DAIRY INDUSTRY

with other forms of agriculture. Perhaps best of all, it engages the farmer in paying work for the entire year. It is for these reasons that the general appearance of any section where dairying is extensively followed, is one of thrift and progress. The growth of the dairy industry is sometimes checked temporarily by unfavorable economic conditions, such as high cost of feeds and high prices of beef, as well as by overproduction of dairy products.

The United States census for 1900 gives the following dairy statistics:

Cows on farms and ranges.....	17,139,674
Cows in towns and cities.....	973,933
Total cows in the United States.....	18,112,707
Total milk produced, gallons.....	7,728,583,350
Butter made on farms, pounds.....	1,071,745,127
Butter made in creameries and urban establishments, pounds.....	420,954,016
Total butter, pounds.....	1,492,699,143
Cheese made on farms, pounds.....	16,372,330
Cheese made in factories and urban establishments, pounds.....	282,332,774
Total cheese, pounds.....	299,006,818
Creameries and cheese factories, number..	9,355
Average annual yield of milk, per cow, gallons.....	424
Alvord's estimates for 1903 are as follows:	
Number of cows producing milk to be used,—	
For milk, cream and condensed milk.....	6,400,000
For making butter (15½ pounds each per year).....	10,900,000
For making cheese (35½ pounds each per year).....	840,000
For rearing calves.....	860,000
Total cows, estimated.....	19,000,000

The aggregate annual value of dairy products is estimated to exceed \$500,000,000. Exports of dairy products have always been small, as the great market for them is at home. The demands of foreign markets differ somewhat from domestic requirements, and as the latter are observed almost universally by makers of butter and cheese, an explanation is thus furnished of the fact that these products do not enjoy the highest reputation abroad. That butter and cheese which will fully satisfy foreign tastes can be supplied from this country has been proved many times by experience of exporters as well as by trial shipments made by the Department of Agriculture. There are great possibilities for American dairy products in other countries, and these will be developed as soon as our production is permanently in excess of our needs. During recent years the annual exports of butter have seldom exceeded 25,000,000 pounds, and those of cheese 75,000,000 pounds. The quantities and values exported (principally to Great Britain) in the fiscal year 1902 were: Butter, 16,002,169 pounds; value, \$2,885,609; cheese, 27,203,184 pounds; value, \$2,745,597. Through the efforts of a few American manufacturers of condensed milk an excellent grade of this article is rapidly becoming established in the world's markets. The value of condensed milk exported in the fiscal year 1902 was \$1,473,564.

The best and most profitable breed of dairy cattle has as yet never been agreed upon. Each of about half a dozen different breeds has strong claims to highest merit and each has its enthusiastic advocates. The latter are often influenced

by conditions which have no economic importance. Different breeds differ markedly in certain characteristics such as size, color, and disposition, as well as quantity and quality of milk. As a general rule, when a large amount of milk is given, it is low in fat-content or "richness." Interesting data regarding several leading dairy breeds of cattle have been compiled by Woll as follows:

BREED	Cows included	Lactation periods	Average yield per lactation period		Average fat	Average cost of		
			Milk	Butt'r fat		Food eaten per day	Producing 100 lbs. milk	Producing 1 lb. of fat
	No.	No.	Lbs.	Lbs.	Per ct.	Cts	Cts	Cts
Ayrshire.....	10	20	6,909	248.5	3.60	14.5	78.5	21.5
Devon.....	5	5	3,684	183.3	4.60	10.3	94.0	20.5
Guernsey.....	10	10	6,210	322.9	5.20	13.5	82.8	15.8
Holst'n-Fries'n....	10	10	8,215	282.0	3.43	17.2	74.7	21.5
Jersey.....	9	18	5,579	301.1	5.40	13.9	94.7	17.4
Shorthorn.....	4	5	8,696	345.4	3.97	14.3	78.7	19.4

There is a wide variation in the milk production of different cows of any breed. Yields of milk amounting to 10,000 pounds (two and one seventh pounds to one quart) in one year are not rare. They are exceeded even by some Jerseys and Guernseys, whose milk is always of high quality. Records of over 20,000 pounds are credited to Holsteins, whose milk tests considerably lower in fat. The great majority of dairy cows throughout the country are "grades," that is, their blood represents different breeds and in no definite proportions. As producers of milk, individual grade cows can be selected that will equal thoroughbred animals, but the latter are more satisfactory for breeding purposes. Farrington reports a high grade Shorthorn cow in Wisconsin that gave in one year 11,131.7 pounds of milk containing 500 pounds of fat, an equivalent of 584 pounds of butter. The total feed consumed in the year cost \$39.60. The total value of her butter and skimmed milk was \$131.83. The cost of feed consumed for every pound of butter produced was only 6.7 cents. Too often the value of the annual product of a cow is very low,—even less than \$25.00. It is a fact that on account of lack of business methods many such cows are kept at an actual loss to their owners.

Dairymen are divided upon the question as to the merits of the "single-purpose" and "dual-purpose" animals. The latter include those that can be profitably disposed of for beef when their period of usefulness in the dairy is ended. Advocates of the former think this advantage is purchased at a high cost and that the single-purpose cows are enough more profitable while in the dairy herd to permit of their final disposition at a low figure.

Milk of the cow is secreted in the mammary glands known as the udder. Wing thus well describes the udder of a good cow: "It should be large and well developed; it should occupy the whole space between the hind legs, extending well up between the thighs and well forward upon the belly. It should be held firmly against the wall of the abdomen. It should be level or nearly so on the bottom, and the four quarters should be as nearly as possible equally developed and each furnished with a cylindrical perpendic-

DAIRY INDUSTRY

ular teat of moderate length. The whole organ should diminish rapidly in size, as the milk is withdrawn. The hair upon the udder should be fairly abundant, fine and soft, and abundantly supplied with brownish dandruff." As milk is a product of the blood, the importance of an ample blood supply to the udder, a vigorous constitution and a strong circulation is readily seen. It is highly important to withdraw the milk from the udder regularly, quietly and completely if the flow is to be maintained.

Van Slyke gives the average of 5,552 American analyses of cow's milk as follows:

Water	Total Solids	Fat	Casein	Albumin	Sugar	Ash
87.10	12.90	3.90	2.50	0.70	5.10	0.70

In addition to the constituents named, certain others are present in minute quantities. The average specific gravity of milk is 1.032. The composition of milk of different cows varies between wide limits. The same may be true of the product of any individual cow from day to day. The New York Agricultural Experiment Station is authority for the following averages of analyses of milks from cows of different breeds:

BREED	No. Analyses	Water	Total Solids	Solids not fat	Fat	Casein	Milk Sugar	Ash	Nitrogen	Daily Milk Yield
Ayrshire.....	252	86.95	13.06	9.35	3.57	3.43	5.33	0.698	0.543	18.40
Devon.....	72	86.26	13.77	9.60	4.15	3.76	5.07	.760	.595	12.65
Guernsey.....	112	85.39	14.60	9.47	5.12	3.61	5.11	.753	.570	16.
Holst'n-Fries'n.	132	87.62	12.39	9.07	3.46	3.39	4.84	.735	.540	22.65
Jersey.....	238	84.60	15.40	9.80	5.61	3.91	5.15	.743	.618	14.07

Koenig gives the variations of milk constituents in about 800 samples as follows:

	Maximum	Minimum
Water	90.69	80.32
Fat	6.47	1.67
Casein	4.23	1.79
Albumin	1.44	.25
Sugar	6.03	2.11
Ash	1.21	.35

In some instances American analyses have found even wider variations.

The most variable constituent of milk is fat. By it the "richness" of milk is judged and the commercial value is determined. Milk fat is a complex mixture containing several glycerine compounds. It is present in the form of minute globules suspended in the remaining or watery portion called the serum. The globules average about one ten thousandth of an inch in diameter and are plainly visible under a high power microscope. About 150,000,000 of them are contained in a single drop of milk. Some conditions affecting fat-content of milk have already been mentioned. There are a few others of importance. From about the middle to the last of the period of lactation, the fat in milk slightly increases. The percentage of fat increases gradually from the first to the last of any milking; the first milk drawn contains about 1 per cent fat and the last as high as 9 or 10 per cent. It is popularly supposed that the feed given a cow has a decided influence on the quality of her milk. As a matter of fact, the milk of a cow in normal condition is little affected in this manner. Feed has a much greater influence upon the quantity of milk than its quality. Casein and albumin are proteid or nitrogen constituents of milk. The former is coagulated by rennet or acid, the latter by heat. Coagulated casein or "curd" enters largely into the composition of cheese. Casein is said to be in a state of

"pseudo-solution" in milk. Milk sugar or lactose is in solution in milk. When separated it resembles powdered sugar. It is less sweet than cane sugar and is used to a considerable extent in druggists' preparations and in certain proprietary foods. The mineral matter in milk, called ash or salts, is the part remaining when milk is evaporated to dryness and burned. It includes phosphorus, potassium, calcium, chlorine, magnesium, sodium, sulphur, and iron. Certain gases and other constituents are present in milk in minute quantities.

a. Skimmed milk.

b. Milk.

c. Cream.

d. Colostrum.

Different grades of milk. (Magnified 300 times.)

The first milk given after parturition is called colostrum. It differs in composition from nor-

DAIRY INDUSTRY

mal milk, and is fit only as food for the newly born calf.

The only precise method of determining the quality of milk is by a complete gravimetric analysis, but for practical purposes the knowledge of the specific gravity of milk and its fat-content is usually sufficient. The specific gravity can be quickly ascertained by the use of a lactometer, and the fat-content can be more or less accurately determined in a few minutes' time by any one of several quick tests. Of these the one in most general use and the most satisfactory is the Babcock test invented by Dr. S. M. Babcock of the University of Wisconsin. A definite amount of milk is mixed with sulphuric acid in a special bottle having a graduated neck. This is rapidly whirled in a machine and the fat is separated from the rest of the mixture by centrifugal force. By the addition of water the fat is brought up into the neck of the bottle, where its exact percentage can be read. Simple tests have been devised for determining the acidity of milk, and whether or not it has been heated.

Milk is a very delicate product and is subject to taints and changes in great number. It readily absorbs strong odors with which it comes in contact, and it is easily given objectionable flavors when the cows are allowed to eat certain foods within a few hours before milking. The flavors caused by garlic and rag-weed are well known; rape and green rye are claimed to produce bad flavors in the milk when they are fed in certain conditions. Flavors due to the causes named are most noticeable when the milk is first drawn from the udder, and may be largely reduced by aëration or the exposure of milk to the air. When held, milk undergoes many different kinds of changes. The most common is souring, but it may become slimy or "ropy," curdle without souring, become "soapy," turn to a red, blue, or other color, develop peculiar and disagreeable odors, form poisonous products, or become altered in other ways. Most of these changes are directly due to bacteria, but some are caused by enzymes or unorganized ferments. Bacteria find in milk an exceptionally favorable medium for growth. There are so many ways by which they enter that it is a practical impossibility to produce milk which is germ-free. But the character and number of the bacteria that get into milk and their development are largely controllable and have much to do with the success or failure of all operations with milk and its products. Many species of bacteria found in milk are perfectly harmless. Some are essential to certain dairy operations, for example, when it is desired to ripen cream to make butter, lactic acid bacteria are needed; they produce lactic acid from milk sugar and cause the milk or cream to sour. Other species have their peculiar effects in the ripening processes of the various forms of cheese. Numerous varieties of bacteria are objectionable and some are dangerous. The latter include pathogenic bacteria and other forms that may be the direct or indirect cause of disease to the consumer. Well authenticated cases are on record of typhoid fever, diphtheria, and other disease germs being carried by milk and there seems to be proof that tuberculosis is sometimes spread in this manner.

The number of bacteria ordinarily found in milk varies from a few thousand to more than a million per cubic centimetre. Most of the

organisms entering milk are carried there by particles of dust, dirt, and foreign matter that fall into the milk from the attendants' hands and clothes, from the hairy coat of the cow and from the dust-laden atmosphere. Another fruitful source of contamination is furnished by milk utensils that have not been thoroughly cleaned. Bacteria thrive best at temperatures between 80 and 100° F. They grow slowly when the temperature is below 60° and there is very little development at temperatures below 45° F. Different methods of reducing bacteria in milk by removing them or killing them are in use. But these methods are only means for somewhat improving undesirable conditions which should have been prevented. When the bacterial content of milk is high because it contains considerable dirt, it can be somewhat reduced by filtering the milk through sand, cotton, or felt, or by passing it through a separator and recombining the streams of cream and skimmed milk. Certain chemicals of a disinfectant nature are sometimes put into milk for the purpose of destroying germ life. They are known as preservatives and the ones most commonly employed are salicylic acid, boracic acid, and formalin. Their use is highly objectionable and in some States and cities they are prohibited by law. Without doubt they inhibit the growth of bacteria, but there are reasons for believing they also reduce the food value of the milk. To a limited extent and for special requirements, milk is sterilized before use. Sterilization means the destruction of *all* germ life, and to accomplish this the milk must be heated to a high degree, sometimes above the boiling point, the exact temperature depending upon the resisting power of spores that happen to be present and the time of exposure. Or it must be treated by a method of intermittent heating, which is objected to on account of the successive heatings and coolings and the amount of work involved. It is generally believed that the digestibility and food value of milk are greatly reduced by subjecting it to high heat. The pasteurization of milk, by which most of the germs are destroyed by exposure to a comparatively low degree of heat, is favored by many authorities, especially when good, clean milk of low bacterial content cannot be secured. Exposure to 150° F. for 30 minutes followed by rapid and thorough cooling is a common practice. There is no definite rule about degree of heat and length of exposure, but the greater the heat and the longer the time, the more germs are destroyed. It is claimed that bacteria can be reduced from many thousand to less than one hundred per cubic centimetre by holding the milk at 156° F. for 30 minutes. Of course the keeping quality would thus be much improved. At about the temperature last named the milk albumin is coagulated and a cooked taste is acquired, hence that degree of heat is rarely exceeded in commercial work. The pasteurization of market milk is not a general practice, but it is gradually increasing. One of the chief objections to pasteurized milk may be stated. It is known that when several species of bacteria are growing in the same medium, some may retard or prevent the growth of others. When milk is heated and the more numerous forms of bacteria are killed a chance *may* be given to some dangerous form not affected by the degree of heat used, to multiply rapidly without restriction and thus to cause serious

DAIRY INDUSTRY

results. When cream is pasteurized it becomes thin in appearance, but its "body" can be restored by the use of a lime preparation called "viscogen."

The successful management of a dairy requires great intelligence, patience, and persistence, and no person should expect to succeed in this business unless he has a decided liking for it. Of course the matter requiring first attention is the location of the farm. The elevation and conformation of the land should be such that good air and drainage would obtain. There should be an abundant supply of pure water. For this purpose a well-protected spring or deep well is best and care should be taken to have it located distant from buildings and other possible sources of contamination. Barns and dairy buildings should stand on elevated ground and they should be isolated from other structures. It is well to store all forage in a building separate from the cow stable. By a system of overhead tracks and suspended cars, feed can be easily brought to the herd and manure economically removed. Unless the manure can be spread at once upon the land, it should be stored under a roof. The stable should be planned to facilitate the work of caring for the herd. Light and fresh air are necessary and should be admitted in abundance. It is generally advised that there be allowed at least one cubic foot of space for every pound of live weight. Where the winters are not too cold and expense of construction must be kept low, the cows may be allowed to stand on the ground, the floor of the barn being made from hard packed clay or earth. Better floors are made from planks treated with tar and laid close together. A cement floor is the best, but because of its hardness an abundance of bedding must be used. The stalls should be from three and a half to four feet wide and just long enough so that when the cow is standing, the manure gutter will be immediately back of the hind feet. Many devices for tying cows have been proposed, but one of the most satisfactory is the stanchion attached above and below by a few links of chain, so as to allow some freedom of motion in all directions. A separate feeding box for each animal is objectionable because of the difficulty of keeping it clean. At many of the best dairies the cows are fed on the floor, a long shallow trough in front of the stalls being constructed for this purpose. Provision should be made for frequent access to water. Milch cows should be allowed to go out doors every pleasant day for exercise.

The selection of cows for a dairy herd, regardless of the breed chosen, should be based upon individual merit. Small and unprofitable producers as well as unhealthy cows and those of weak constitution should be avoided, and when they are found in the herd, advantage should be taken of the first opportunity to displace them. It is well said "the bull is half the herd." When calves are to be raised, as is the rule in most dairies, the influence of the bull upon the development of the herd is readily seen. If possible a bull of proved excellence should be used. It is always well to give special attention to the breeding of the bull and attach considerable importance to the performances of his dam and grand-dams. The quantity of milk given by each cow, and its fat test, should be recorded at least one day every two weeks for the purpose of showing which animals

of the herd are profitable and which are not. The time for breeding cows depends upon the requirements for milk. Formerly it was the general practice in dairies not supplying milk for retail sale to have cows calve in the spring and be "dry" throughout the winter. At the present time, however, a large number of dairies are operated most profitably during the winter for the purpose of supplying milk for butter and cheese making, as well as for consumption in towns and cities.

Feeding for best results is a subject which requires much study and experience. Especially is this the case where winter dairying is practised. In the first place feed should be wholesome and palatable. Then care should be taken to have the nitrogenous and non-nitrogenous components properly proportioned. Just what feeds will be used depends largely upon local conditions, cost, availability, etc. Practical rations as fed in different parts of the country and reported by Woll are as follows: New York, 20 pounds hay, 2 pounds wheat bran, 2 pounds cotton-seed meal, 2 pounds hominy meal. Vermont, 30 pounds corn silage, 10 pounds hay, 4.2 pounds corn meal, 4.2 pounds wheat bran, 8 pounds linseed meal. Wisconsin, 26 pounds corn silage, 10 pounds clover hay, 5 pounds timothy hay, 8 pounds wheat middlings, 1½ pounds oil meal. Most coarse fodders are low in nitrogenous component or protein; of these, the leguminous plants contain the highest percentages of protein. The concentrated feeding stuffs commonly used and containing the most protein, are cotton-seed meal, linseed meal, gluten meal, dried brewer's grains, wheat middlings, and wheat bran.

Changes in methods of feeding which are especially marked at the present time include the growing use of ensilage and the increasing practice of "soiling" or cutting green feeds of different kinds and bringing these to the animals instead of allowing them to graze.

Milk should be produced and handled in such a manner as to keep bacterial contamination as low as possible. The practical way of accomplishing this is to observe the utmost cleanliness in all the stages of production, to cool the milk at least to 45° F. promptly after it is drawn and to hold it continuously at such low temperature. As pathogenic or disease-producing bacteria are the most dangerous of all forms ever found in milk, special care should be taken to exclude them. For this purpose it is necessary to give close attention to the health of the animals and all persons having to do with the herd or the milk. Serious outbreaks of disease have been due to the handling of milk by persons suffering only mildly with a contagious disease such as typhoid fever or who have been exposed to the disease. Dairy cows should be examined at least three times every year by a competent veterinarian; some of the best dairies have examinations more often. The milk of a cow suspected of being out of condition or not in good health should not be used. By far the largest number of bacteria that enter milk are carried by small particles of foreign matter, such as manure, dust, dirt, hairs, etc. Of course these are most abundant in illy-kept barns where milkers as well as the cows and their surroundings are allowed to be unclean. Barns should be kept thoroughly clean. The use of pine shavings for bedding contributes much to

DAIRY INDUSTRY

cleanliness and they are now found in many of the best dairies. Barns should be so constructed and the work should be so planned that there would be no occasion for unnecessary dust in the atmosphere at the time of milking. Milch cows should be "groomed" daily, and udders should always be cleaned just before milking, with the aid of a brush and a damp cloth. As bacteria are liable to be especially numerous in the milk nearest the teat opening, it is a good practice to discard the first few streams drawn. The operation of milking should be performed in a quiet manner. Freeman has shown that the milk drawn by a man who violently agitates the udder may contain 10 times as many bacteria as that drawn by a quiet milker. Milk should not be used until the fourth or fifth day after calving. In addition to being in good health and avoiding exposure to contagion, the attendants in a dairy should be personally clean. Too often this important matter is overlooked and milk is considerably infected by germs from dirty garments and dirty hands. A special clean suit should be put on and hands should always be thoroughly cleaned before milking. The practice of "wet" milking is extremely filthy. All dairy utensils should

lower surface. The usual cooling device serves also as an aerator and consists of an apparatus made of thin metal and so arranged that cold water is on one side while the milk being cooled passes over the other. By certain forms of coolers, it is found entirely practicable to quickly bring the temperature of the milk to within 2 to 4° of the temperature of the water. After cooling, milk should be placed in cans or jars, as may be required, and held at a low temperature continuously until used. Recently it has become the practice in a few places and to a limited extent to put milk intended for consumption into glass jars and seal it within a few minutes after it is taken from the cow, and then cool it. This seems to be satisfactory when the milk is exceptionally pure and in no need of aëration. When milk is to be used for butter and cheese making it is not necessary for it to be held at so low a temperature as when it is to be used for retail trade, for the reason that the development of a certain amount of acidity is desirable. This is fortunate for dairymen who happen to have neither cold springs nor ice. Their milk may be delivered to the butter and cheese factory while perfectly fresh, but as high as 80° F., and yet be used in the manufacture of the best butter or cheese.

Items that need to be kept in mind and conditions which should be observed in the management of a first-class dairy are summarized in 'Fifty Dairy Rules' composed by the writer and issued by the United States Department of Agriculture, as follows:

FIFTY DAIRY RULES.

THE OWNER AND HIS HELPERS.

1. Read current dairy literature and keep posted on new ideas.
2. Observe and enforce the utmost cleanliness about the cattle, their attendants, the stable, the dairy, and all utensils.
3. A person suffering from any disease, or who has been exposed to a contagious disease, must remain away from the cows and the milk.

THE STABLE.

4. Keep dairy cattle in a room or building by themselves. It is preferable to have no cellar below and no storage loft above.
5. Stables should be well ventilated, lighted, and drained; should have tight floors and walls and be plainly constructed.
6. Never use musty or dirty litter.
7. Allow no strong smelling material in the stable for any length of time. Store the manure under cover outside the cow stable and remove it to a distance as often as practicable.
8. Whitewash the stable once or twice a year; use land plaster in the manure gutters daily.
9. Use no dry, dusty feed just previous to milking; if fodder is dusty, sprinkle it before it is fed.
10. Clean and thoroughly air the stable before milking; in hot weather sprinkle the floor.
11. Keep the stable and dairy room in good condition, and then insist that the dairy, factory, or place where the milk goes be kept equally well.

THE COWS.

12. Have the herd examined at least twice a year by a skilled veterinarian.
13. Promptly remove from the herd any animal suspected of being in bad health, and reject her milk. Never add an animal to the herd until certain it is free from disease, especially tuberculosis.
14. Do not move cows faster than a comfortable walk while on the way to place of milking or feeding.
15. Never allow the cows to be excited by hard driving, abuse, loud talking, or unnecessary disturbance; do not expose them to cold or storms.
16. Do not change the feed suddenly.

Milk cooler and aerator for use with running water.

be simply constructed and easily cleanable. They should not be made of any open or porous material such as wood. Immediately after use they should be cleaned and then sterilized by boiling water, or better, steam. Milk should be promptly removed from the stable, strained, cooled, and cold-stored. It should be handled in a room specially fitted for the purpose,—fresh, clean, and light. A good form of strainer is provided with the usual wire gauze of fine mesh and a double thickness of sterile cheese cloth filled between with pure white sterile cotton. The cloth and cotton should be changed as often as they commence to show dirt near the

DAIRY INDUSTRY

17. Feed liberally, and use only fresh, palatable feed-stuffs; in no case should decomposed or moldy material be used.
18. Provide water in abundance, easy of access, and always pure; fresh, but not too cold.
19. Salt should always be accessible.
20. Do not allow any strong flavored food, like silage, turnips, cabbage, and garlic, to be eaten, except immediately after milking.
21. Clean the entire body of the cow daily. If hair in the region of the udder is not easily kept clean it should be clipped.
22. Do not use the milk within 20 days before calving, nor for 3 to 5 days afterward.
47. Do not haul waste products back to the farm in the same cans used for delivering milk. When this is unavoidable, insist that the skimmed milk or whey tank be kept clean.
48. Cans used for the return of skimmed milk or whey should be emptied and cleaned as soon as they arrive at the farm.
49. Clean all dairy utensils by first thoroughly rinsing then in warm water; then clean inside and out with a brush and hot water in which a cleaning material is dissolved; then rinse and lastly sterilize by boiling water or steam. Use pure water only.
50. After cleaning, keep utensils inverted, in pure air, and in as much sunlight as possible, until wanted for use.

MILKING.

23. The milker should be clean in all respects; he should not use tobacco; he should wash and dry his hands just before milking.
24. The milker should wear a clean outer garment, used only when milking, and kept in a clean place at other times.
25. Brush the udder and surrounding parts just before milking, and wipe them with a clean, damp cloth or sponge.
26. Milk quietly, quickly, cleanly, and thoroughly. Cows do not like unnecessary noise or delay. Commence milking at exactly the same hour every morning and evening, and milk the cows in the same order.
27. Throw away (but not on the floor, better in the gutter) the first few streams from each teat; this milk is very watery and of little value, but it may injure the rest.
28. If in any milking a part of the milk is bloody or stringy or unnatural in appearance, the whole mess should be rejected.
29. Milk with dry hands; never allow the hands to come in contact with the milk.
30. Do not allow dogs, cats, or loafers to be around at milking time.
31. If any accident occurs by which a pail full or partly full of milk becomes dirty, do not try to remedy this by straining, but reject all this milk and rinse the pail.
32. Weigh and record the milk given by each cow, and take a sample morning and night, at least once a week, for testing by the fat test.

CARE OF MILK.

33. Remove the milk of every cow at once from the stable to a clean, dry room, where the air is pure and sweet. Do not allow cans to remain in stables while they are being filled.
34. Strain the milk through a metal gauze and a flannel cloth or layer of cotton as soon as it is drawn.
35. Aerate and cool the milk as soon as strained. If an apparatus for airing and cooling at the same time is not at hand, the milk should be aired first. This must be done in pure air, and it should then be cooled to 45 degrees if the milk is for shipment, or to 60 degrees if for home use or delivery to a factory.
36. Never close a can containing warm milk which has not been aerated.
37. If cover is left off the can, a piece of cloth or mosquito netting should be used to keep out insects.
38. If milk is stored, it should be held in tanks of fresh, cold water (renewed daily), in a clean, dry, cold room. Unless it is desired to remove cream, it should be stirred with a tin stirrer often enough to prevent forming a thick cream layer.
39. Keep the night milk under shelter so rain cannot get into the cans. In warm weather hold it in a tank of fresh cold water.
40. Never mix fresh warm milk with that which has been cooled.
41. Do not allow the milk to freeze.
42. Under no circumstances should anything be added to milk to prevent its souring. Cleanliness and cold are the only preventives needed.
43. All milk should be in good condition when delivered. This may make it necessary to deliver twice a day during the hottest weather.
44. When cans are hauled far they should be full, and carried in a spring wagon.
45. In hot weather cover the cans, when moved in a wagon, with a clean wet blanket or canvas.

THE UTENSILS.

46. Milk utensils for farm use should be made of metal and have all joints smoothly soldered. Never allow them to become rusty or rough inside.

Milk is a food of great value. Next to bread and water it is used more commonly than any other article of food or drink. It contains in easily digestible form the four kinds of nutrients required by the body,—protein, fats, carbohydrates and mineral matter. With few exceptions it contains more nutritive matter than can be obtained at the same cost in any other food. Jordan has shown the economy of using milk in the family dietary. The increased use of good wholesome milk is strongly recommended. Skimmed milk also contains considerable food value and could well be used as a human food much more than is the present custom. The average amount of milk consumed daily in cities and towns is about one half pint per capita and to supply this there must be within easy reach one cow for about every 12 persons. Many cows are kept within corporate limits and their product is delivered twice daily,—often "warm from the cow." For best results it should be cooled promptly, but it is generally used before any considerable change takes place. Most of the milk supply of small and medium-sized towns and a large portion of the milk used in cities is taken from the dairy to the consumer by teams, and the general rule is to serve in the morning the product of the same morning and previous evening.

The bulk of the milk used in large cities is transported by special trains and sometimes these originate as far as 200 to 300 miles from their destination. "Train" milk varies from 12 to 48 hours old when delivered to the consumer. Most of it is either 24 or 36 hours old. Producers, dealers, and shippers have learned that milk so long delayed must receive good care, and it often happens that this milk is finally delivered in better condition than milk less old, but neglected. The receipts of milk in New York city are over 1,335,000 quarts daily, and practically all is brought by trains. Milk is usually transported in heavy tin cans holding $8\frac{1}{2}$, 20, 30, or 40 quarts. In recent years bottles have come into use and they are gradually increasing in favor. Some concerns maintain bottling stations near the producing farms, and their product is shipped in glass jars which are packed in cracked ice during hot weather. Much milk is bottled in the cities before delivery.

Farmers usually receive two to three cents per quart for their milk in the summer and one cent more in the winter. City retail prices range from 6 to 10 cents per quart. Most milk is delivered promptly after it reaches the city. When it must be held before delivery a clean, cold place must be provided for this purpose. The best results with milk in cans or bottles is obtained when these are stored in tanks of ice water. Cream cans should be buried in cracked ice. If the products are thoroughly cold they may be held satisfactorily in cold, dry air.

Much is being done by State and municipal governments to improve market milk, but the greatest influence to this end that can be produced is a determined demand on the part of the consumers for pure milk and a willingness to pay for it. Medical milk commissions in a few cities are entitled to credit for good results already obtained. In New York and Philadelphia several concerns are distributing milk which is produced and handled under the supervision of commissions of physicians. These concerns are pioneers and deserving of great credit. It is their aim to produce milk in a scientific manner and to take every reasonable measure to insure its purity. One of them operates in 16 different cities and conducts dairies which are models in cleanliness and management. The same company has developed a large trade in "modified milk," which is milk altered in its composition according to the peculiar requirements of infants and invalids, and specially prepared upon physicians' prescriptions. The comparatively few high-class dairies now in operation are doing much to stimulate a wholesome interest in the subject.

Kumiss is one of the forms of fermented milk used as a beverage. It is produced with the aid of yeast.

The principal American publications on dairying, exclusive of butter and cheese, include the following: Wing, 'Milk and Its Products' (1897); Conn, 'Dairy Bacteriology' (1903); Farrington and Woll, 'Testing Milk and Its Products' (1897); Grotenfelt, 'Principles of Modern Dairy Practice' (1894); Freeman, 'Low Temperature Pasteurization of Milk' (1896); Jones, 'Dairying for Profit' (1894); Monrad, 'Pasteurization and Milk Preservation' (1895); Russell, 'Outlines of Dairy Bacteriology' (1894); Snyder, 'The Chemistry of Dairying' (1897); also 'Hoard's Dairymen,' weekly periodical and bulletins issued by the Department of Agriculture and by experiment stations in the several dairy States.

RAYMOND A. PEARSON,
Gen. Mgr. of the Walker-Gordon Laboratory Co.

Dais, dā'is, a platform or raised floor at the upper end of an ancient dining-hall, where the high table stood; also a seat with a high wainscot back, and sometimes with a canopy, for those who sat at the high table. The word is also sometimes applied to the high table itself.

Daisy, the popular English name of a plant of the genus *Bellis* of the natural order *Composita*. Properly the name belongs to the English daisy (*B. perennis*). This is a native of Europe and Asia, and is one of the most common of the flowers of England. In the United States the English daisy is generally found in gardens, but it has escaped in some cases, and may be found growing in waste places or on lawns from Nova Scotia through New England and southern New York to eastern Pennsylvania. It has been naturalized in California and British Columbia. One species of the true daisy, the western daisy (*B. integrifolia*), is a rare plant found in moist soil from Kentucky and Tennessee to Arkansas and Texas. The flowers generally called daisies in the United States belong to the chrysanthemum family, although some asters are also given the common name.

Daisy Miller, a novelette by Henry James, published in 1878. From the constant incongruity between the Miller social standards and the Draconian code of behavior of the older European communities, come both the motive and the plot of the story.

Dak, dāk, or **Dawk**, a Hindu word used in India for the mail or post; a relay of men, as for carrying letters, despatches, etc., or travelers in palanquins. The route is divided into stages, and each bearer, or set of bearers, serves only for a single stage. A dak-bungalow is a house at the end of the stage designed for those who journey by palanquin.

Dakar, dā-kār', Senegal, a port furnishing one of the best harbors on the west coast of Africa. It is situated near Cape Verde. There is a railroad between the port and the capital, Saint Louis. Dakar is a fortified military post. Pop. (1902) 12,000.

Dako'ta, or **Dakotah**, a tribe of North American Indians, constituting at one time an important element in the great Sioux group. They were reported numerous in the 17th and 18th centuries, and roamed over extensive hunting grounds in parts of the present States of North Dakota and South Dakota. The tribe consisted of six sub-tribes: (1) Santee; (2) Sisseton; (3) Yankton; (4) Wahpeton; (5) Yanktonnai; (6) Teton. These sub-tribes were divided into bands or groups; as, the Tetons consisted of the Brulé, Blackfeet, and other groups. The Dakotas were fond of war and when not fighting against outsiders would sometimes fight among themselves. In 1658 they had 30 towns on the Mississippi, the Missouri, and Saint Croix. The old war spirit has not died out; in 1862 a portion of the tribe attacked the whites and killed about 1,200. In 1890-1 the whites feared another uprising when the ghost-dance took place at the Pine Ridge agency. The Dakotas are located in the United States, chiefly in North and South Dakota, Nebraska, and Montana. There are about 900 in Canada, and in the United States about 2,800. See INDIAN SCHOOLS; RESERVATIONS; SIOUXAN.

Dakota. See NORTH DAKOTA; SOUTH DAKOTA.

Dakota River. See JAMES RIVER.

Dakota Stage, one of the formations of the Upper Cretaceous series in the United States. The rocks, mostly conglomerates and sandstones, cover a vast area extending over the Great Plains from Texas northward into Canada. Their origin is still a matter of speculation, since they are not marine; and in Texas lie unconformably upon the Comanche limestone. West of the Rocky Mountain uplift the Dakota rocks are more fine-grained, and include beds of coal or lignite of workable thickness. In much of the Rocky Mountain region the Dakota rests conformably upon Lower Cretaceous and even Jurassic strata. The exact equivalent of the Dakota stage along the eastern border of the United States is undetermined. The lower cross timber sand of Georgia and Mississippi is probably equivalent to the Dakota. See CRETACEOUS SYSTEM.

Daksha, dāk'shā, in Hindu mythology, a priest to whom Siva gave a ram's head out of revenge, because he did not invite the god to his grand sacrifice.

Dal, *däl*, a Swedish word signifying, like the German *Thal*, valley, as in Dalcarnia.

Dalaguete, *dä-lä-gä'tä*, Philippines, a town on the southeast coast of Cebú, 44 miles southwest of the town of Cebú. Trade in the products raised in the interior is carried on with the adjacent islands. In two years the population increased about 2,000. The town would be of more importance as a port of entry, but it has little or no protection from the northeast monsoons and from the south winds. Pop. 21,825.

Dalberg, *däl'bërg*, **Karl Theodor**, Prince and Archbishop of Mayence, chancellor of the empire, and elector: b. 1744; d. Ratisbon 10 Feb. 1817. Having made his academic studies in the universities of Göttingen and Heidelberg, he devoted himself to the study of canon law and entered the ecclesiastical state. In 1772 he was made, by the Elector-Archbishop of Mayence, privy counselor and governor of Erfurt. His administration was directed purely to the welfare of the people and he earned the reputation of being a faithful and capable man of affairs. He continued in the service of the elector, and at the death of his patron he succeeded him as archbishop, elector, and arch-chancellor of the empire (1802). In 1804 the Pope, Pius VII., being then in Paris for the occasion of the crowning of Napoleon, Archbishop Dalberg was invited by Napoleon to Paris for the purpose of inducing Pope Pius to approve a proposed readjustment of ecclesiastical affairs in Germany. The Archbishop served well the interests of the French emperor, and later had his reward when the readjustment was effected, for, though he had to give up the archiepiscopal see of Mayence and his dignities in the empire, he was more than recompensed by being made metropolitan of Ratisbon, while Aschaffenburg, Wetzlar, and Ratisbon were erected, on his behalf, into a principedom. Further his purely ecclesiastical jurisdiction was enlarged by being made to extend over such parts of the ecclesiastical jurisdiction of Mayence, Cologne, and Treves as lie on the right bank of the Rhine. But of all these dignities and powers, except the archbishopric of Ratisbon, he was deprived after the fall of Napoleon. He was a man of learning, a lover and patron of art, and the intimate friend of Goethe, Schiller, Wieland, and the great contemporary lights of German literature. He was author of several works on philosophy and æsthetics (much consulted by scholars), and he took a lively interest in natural history, mineralogy, chemistry, and agriculture.

Dalbergia, a genus of fine tropical forest trees and climbing shrubs, natural order *Leguminosæ*, some species of which yield excellent timber. *D. latifolia* (the blackwood, or East Indian rosewood) is a magnificent tree, furnishing one of the most valuable furniture woods. *D. sissoo* gives a hard durable wood, called sissoo, much employed in India for railroad sleepers, house- and ship-building, etc.

D'Albert, *däl-bär*, **Eugene**, English musician: b. Glasgow, Scotland, 10 April 1864. He is the son of an English composer of French descent. He was at first trained by his father, but subsequently studied with Sir Arthur Sullivan and Dr. Stainer, and after 1882 was a pupil of Liszt. He is very famous as a pianist and has given recitals in the chief cities of Europe

and the United States. Besides concertos, string quartettes, songs, etc., he has composed the operas of 'Ruby'; 'Ghismonda'; 'The Departure'; etc.

Dalby, **Isaac**, English mathematician: b. Gloucestershire 1744; d. Farnham, Surrey, 3 Feb. 1824. He was self-educated, and while teaching arithmetic in London, his acquirements became known. In 1782 he was appointed mathematical master of the naval school at Chelsea, and in 1787 was employed, on the recommendation of the celebrated instrument-maker Ramsden, to assist Gen. Roy in the great trigonometrical survey. In 1799, on the formation of the Royal Military College at High Wycombe, he was appointed professor of mathematics, and continued to hold the appointment till 1820.

Dale, **Alan** (ALFRED J. COHEN), American dramatic critic: b. Birmingham, England, 14 May 1861. After leaving Oxford University he came to the United States and was dramatic critic on the *New York Evening World* 1887-95, and on the *New York Journal* from 1895. He has published: 'Jonathan's Home'; 'A Marriage Below Zero'; 'An Eerie He and She'; 'My Footlight Husband'; 'A Moral Busybody'; etc.

Dale, **David**, Scottish manufacturer: b. Stewarton, Ayrshire, 6 Jan. 1739; d. Glasgow 17 March 1806. He commenced life as a weaver, and having made the acquaintance of Sir Richard Arkwright a partnership was entered into between them for the erection of cotton-mills on the Clyde, and the settlement of New Lanark was in consequence formed. He had also extensive shares in other spinning factories established under his superintendence in various parts of Scotland, and was head partner in a large manufacturing firm in Glasgow, besides acting there as agent for the Royal Bank of Scotland. In 1799 he retired from business, and disposed of the works at New Lanark to a company of English capitalists, who entrusted the management of them to the celebrated Robert Owen (q.v.), who afterward married Mr. Dale's eldest daughter. He was the founder and pastor of a small religious sect called "Dalites," or "Old Independents."

Dale, **Richard**, American naval officer: b. Norfolk, Va., 6 Nov. 1756; d. Philadelphia 24 Feb. 1826. While serving as a midshipman on board of the American brig of war, Lexington, he was taken by a British cutter; but, after being confined a twelvemonth in prison, he effected his escape into France, where he joined the celebrated Paul Jones, then commanding the American ship *Bon Homme Richard*, and was the first man that boarded the English frigate *Serapis*, which was captured. In 1801 he had the command of an American squadron and hoisted his pennant on board the *President*.

Dale, **Robert William**, English Congregational clergyman: b. London 1 Dec. 1829; d. 13 March 1895. He was for many years one of the foremost of non-conformist leaders in England, and in 1877 delivered a series of lectures on preaching at Yale University, being the first Englishman appointed to the Lyman Beecher lectureship. Among his more important writings are: 'The Atonement' (1875); 'Lectures on Preaching' (1877); 'The Epistle to the Ephesians: its Doctrine and Ethics' (1882);

D'ALEMBERT — DALLAS

'The Living Christ and the Five Gospels' (1890); 'Fellowship of Christ' (1891). He was a versatile and powerful speaker and exercised an extended influence.

D'Alembert, Jean le Rond. See **ALEMBERT, JEAN LE ROND** d'.

Dalhousie, dāl-hoo'zī or dāl-how'zī, James Andrew Ramsey, 10TH EARL AND 1ST MARQUIS OF, British statesman: b. near Edinburgh 22 April 1812; d. 19 Dec. 1860. After filling the offices of vice-president (1843) and president of the board of trade (1844), he was appointed governor-general of India (1847). In this post he showed high administrative talent, establishing railway lines, telegraphs, irrigation works, etc., and under his rule was annexed the Punjab, Oude, Berar, and other native states, as well as Pegu in Burma, to the British Empire in India. In 1849 he was made a marquis.

Dalhousie, New Brunswick, capital of Restigouche County, and a port of entry. It is situated on Chaleurs Bay and the estuary of Restigouche River. The chief industries are fishing and trading in lumber, salmon, and lobsters. Pop. (1901) 3,000.

Dalhousie College and University, an institution of learning located at Halifax, N. S. It was founded in 1818 by the Rt. Hon. George Ramsay (q.v.), 9th earl of Dalhousie, whose last public act in Nova Scotia was the laying of the cornerstone of the old building 22 May 1820, but it was not until 13 Jan. 1821 that the 'bill to incorporate the Governors of Dalhousie College at Halifax' became a law. The purpose of the college was originally stated "for the education of youth in the higher branches of science and literature." The first name of Dalhousie was the "College of Halifax," but in 1821 the Legislature granted £1,000 to the new college and named it after its founder. In 1841 university powers were granted to the college. The early history of Dalhousie is a brave struggle for existence. Two attempts were made to unite it with King's College (q.v.) but both proved failures. From 1844 to 1863 Dalhousie ceased to operate as a college and the governors either allowed the funds to accumulate or managed it as a high school. In 1863 the college was reorganized and from this time it may be said to date its modern development as an institution of learning, with a staff of six professors, a tutor in modern languages and about 60 students. The governing powers of the institution are (1) the Board of Governors, the supreme governing body. Appointments to it are made by the Governor-in-Council on the nomination of the Board. The governors have the management of the funds and property of the college; the power of appointing the president, professors, and other officials, and of determining their duties and salaries, and the general oversight of the work of the university. (2) The Senate, consisting of the president and professors. To this body are intrusted, by statute, the internal regulations of the university, subject to the approval of the governors. All degrees are conferred by the Senate. (3) The Faculties of Arts, Science, Law, and Medicine. These are committees of the Senate for the supervision of the teaching of the university, the preparation of regulations governing the courses of study, and the recom-

mendation of suitable candidates for prizes, scholarships, diplomas and degrees.

The college is well equipped for its work and is constantly enlarging its sphere of usefulness. It has a large student body and admits students of either sex. Many generous gifts have been made to Dalhousie, notably those of the late George Munro of New York, in 1879, which did much to put the institution on a solid financial basis. Mr. Alexander McLeod of Halifax, Sir William Young and Mr. John P. Mott have also made large gifts to the college.

Dalin, dāl'lin, Olof von, Swedish historian and poet: b. Vinberga, Holland, 29 Aug. 1708; d. Drottingholm 12 Aug. 1763. In 1737 he was appointed royal librarian, and in 1751 became preceptor to the prince royal (afterward Gustavus III.), and in recompense for his zeal and talents was nominated historiographer-royal (1759), and chancellor of the court of Sweden (1763). He exerted much influence by his periodical paper, 'The Swedish Argus' (1733-4), and still more by his spirited poems, particularly 'Satires' (1729), an excellent poem on the liberty of Sweden (1742), many songs, epigrams, and fables. The best edition of his poetical works appeared at Stockholm (1782-3). He acquired equal reputation by his able history of Sweden (1777). He also participated in the foundation of the Academy of Belles-lettres by Ulrica Eleonora, 1753.

Dall, Caroline Wells Healey, American author: b. Boston, Mass., 22 June 1822. She has been an industrious literary worker, and is the author of many books, among which are: 'Essays and Sketches' (1849); 'Woman's Right to Labor' (1860); 'The College, the Market, and the Court' (1861); 'Egypt's Place in History' (1868); 'Patty Gray's Journey to the Cotton Islands,' and 'What We Really Know About Shakespeare' (1885).

Dall, William Healey, American naturalist: b. Boston, Mass., 21 Aug. 1845. He is the son of Caroline W. H. Dall (q.v.). He is a member of the United States Geological Survey and of many of the scientific societies at home and abroad. Among his published books are: 'Alaska and its Resources' (1870); 'The Currents and Temperatures of Bering Sea and the Adjacent Waters' (1882); and 'Report on the Mollusca, Brachypoda, and Pelecypoda' of the Blake dredging expedition in the West Indies (1886). He has further published: 'Pacific Coast Pilot'; 'Coast Pilot of Alaska,' etc.

Dallas, Alexander James, American statesman: b. Island of Jamaica, 21 June 1759; d. Trenton, N. J., 14 Jan. 1817. He studied law in London and settled in Philadelphia in 1783. He became eminent at the bar, and was United States district attorney in Pennsylvania from 1801 to 1814. He was secretary of the treasury under Madison.

Dallas, George Mifflin, American diplomatist: b. Philadelphia, Pa., 10 July 1792; d. there 31 Dec. 1864. He was the son of A. J. Dallas (q.v.). In 1813 he was admitted to the bar, and soon after entered the diplomatic service. In 1831 he was elected a United States senator from Pennsylvania; was United States minister to Russia 1837-9, and in 1844 was elected Vice-President of the United States. In 1846 his casting-vote as president of the Senate repealed the protective tariff of 1842, though he had

DALLAS

previously been considered a Protectionist. His course on this question aroused much indignation in Pennsylvania. He was United States minister to Great Britain from 1856 to 1861. His principal published writings were posthumous, and include a 'Series of Letters from London' (1869), and a 'Life of A. J. Dallas' (1871).

Dallas, Ga., town, county-seat of Paulding County; on the Southern Railroad; about 30 miles northwest of Atlanta. Pop. 700.

Dallas, Ga., Battle Lines at. After the Confederate evacuation of Dalton (see DALTON, GA., MILITARY OPERATIONS AT), 12 May 1864, and the battle of Resaca, 14-15 May, Gen. Joseph E. Johnston's army retreated by way of Calhoun and Adairsville to Cassville, where Gen. Johnston prepared to make a stand, and Gen. Sherman closed in on him for battle; but Johnston abandoned Cassville during the night of the 19th, and next day crossed to the south side of the Etowah. Sherman occupied Cassville and Kingston, and prepared for another advance. As Johnston held the line of the railroad at Allatoona Pass and other points in advance of Marietta, Sherman concluded to turn those positions by moving from Kingston to Marietta by way of Dallas, a small town about 25 miles south of Kingston and 20 miles west of Marietta, and the converging point of many roads. On the 23d the movement began, but on the same day the Confederate cavalry discovered it, and Johnston divined its intention and prepared to check it by marching to Dallas and covering the roads leading to it.

On the 25th as the advance of Hooker's (Twentieth) corps neared Dallas it was discovered that Hood's Confederate corps held the cross roads at New Hope Church, four miles northeast of Dallas. Hooker concentrated his corps and attacked Hood late in the evening and was repulsed with a loss of 1,346 killed and wounded, and about 60 missing. Hood's loss was less than 400. During the night and early next day the rest of the army moved up on the right and left of Hooker and entrenched, McPherson's two corps, on the right, holding Dallas.

Sherman gradually extended to the left, skirmishing heavily all along the line, and on the evening of the 27th T. J. Wood's division of the Fourth corps attacked the extreme right of the Confederate army near Pickett's Mill and, after a most gallant effort, was repulsed with a loss of 1,224 killed and wounded, and 318 missing. The Confederates reported a loss of 85 killed and 363 wounded. This engagement was a little over two miles northeast of New Hope Church.

There was now heavy skirmishing all along the line, some seven miles in length; and Sherman, still extending to the left, ordered McPherson, who was entrenched at Dallas, to close in on Hooker at New Hope Church, that Hooker might extend to the left; but McPherson deferred the movement until next day (28th), and was getting ready to make it when he was attacked. The Confederates made a desperate effort to seize his works, but were repulsed with a loss of some 390 killed and wounded. McPherson's loss was over 400, of whom 325 were killed and wounded, and 54 missing, in the

Fifteenth corps, which bore the brunt of the assault. This was the battle of Dallas.

Sherman continued his movement to the left; McPherson left Dallas 1 June, and closed in on Hooker at New Hope Church; Hooker went to the left; all the wagon roads leading to Allatoona and Ackworth were secured. Allatoona was seized, also the railroad back to the Etowah, and 4 June Sherman was preparing to attack Johnston at New Hope Church, when he found that he had abandoned all his works and fallen back to Kenesaw Mountain; whereupon Sherman moved to the railroad at Ackworth and Big Shanty, and the first stage of the campaign for Atlanta ended. The Union loss in the battles and constant heavy skirmishing near and at Dallas (25-31 May) was about 3,600 killed and wounded. Johnston reports the Confederate loss at 2,005 killed and wounded. The first stage of the campaign (6-31 May) cost the Union army 9,299 killed, wounded, and missing. Johnston reports the Confederate loss for the same period at 5,807 killed and wounded. Consult: 'Official Records,' Vol. XXXVIII.; Van Horne, 'History of the Army of the Cumberland,' Vol. II.; Cox, 'Atlanta'; Johnston, 'Narrative'; Sherman, 'Memoirs,' Vol. II.; the Century Company's 'Battles and Leaders of the Civil War,' Vol. IV. E. A. CARMAN.

Dallas, Ore., city, county-seat of Polk County; situated on La Creole Creek and the Southern Pacific Railroad; about 70 miles southwest of Portland. The industries are dependent upon the productions of the fertile Willamette valley, in which Dallas is situated. Flour-mills, sash and door factories, saw-mills, woolen factories, and tanneries constitute some of the industries. Sandstone quarries in the vicinity furnish excellent stone. Pop. 2,000.

Dallas, Texas, city county-seat of Dallas County; on Trinity River, and on the Missouri, Kansas & Texas, the Texas & New Orleans, the Gulf, Colorado & Santa Fé, the Texas & Pacific, and the Houston & Texas Central R.R.'s; about 200 miles north by west of Austin, the capital of the State. Dallas is in a fertile agricultural region in which the chief products are cotton, wheat, corn, and fruits.

Manufacturing.—It has extensive lumber interests and its manufacturing establishments are increasing. The principal manufacturing industry is saddlery in which Dallas leads all other places in the United States; cotton gin machinery is also extensively manufactured; other prominent manufactories are flour-mills, brewery, various iron and metal works, cotton gins, grain elevators, lumber-mills, woolen-mills, cottonseed-oil mills, and cotton compressors.

Trade and Commerce.—The wholesale trade of the city embraces all lines of goods, and covers a territory comprising all the States and territories of the southwest, and, in some lines, all of the Southern and Western States. It ranks with Kansas City as first in the distribution of farm machinery and implements. The total wholesale trade in 1903 was \$50,000,000, the largest retail trade in the Southwest. Dallas has an extensive mail order business; the postal and express receipts are twice as large as that of any other city in the State.

Municipal Service and Improvements.—The city owns and operates water-works, which cost

DALLES, THE—DALMATIA

about \$1,500,000. The present supply of water (1903) is secured by impounding storm waters, but it is to be augmented by artesian water. The chief public structures are the county courthouse, Federal building, city hall, and Carnegie Public Library. There are fine office buildings, stores, and hotels.

Schools, Colleges, and Libraries.—The public free school system embraces 12 white and five colored schools, at which 8,000 pupils attend, two parish schools and seven suburban schools. Other schools are, Saint Mary's Female College (P. E.), Ursuline Academy, Academy of the Sacred Heart, Saint Mathew's Grammar School, Southwestern University (Med. Dep.), Baylor University (Med. Dep.), Physio-Medical, Dallas Medical, Patton Female Seminary, Landon Conservatory of Music; several business colleges and special and private schools. The Carnegie Public Library cost \$50,000.

Churches and Charities.—Dallas is the see of the Roman Catholic and the Protestant Episcopal dioceses, and the official home of a bishop of the Methodist Episcopal Church (South). The number of church edifices are Baptist, 12; Catholic, 7; Christian, 6; Congregational, 4; Episcopal, 6; Evangelical, 3; Methodist, 12; Hebrew, 3; Presbyterian, 10; Christian Science, Seventh Day Adventist, and Unitarian, one each; colored churches of various denominations, 20. The State headquarters of the Salvation Army are located here. The charity institutions are: Buckner's Orphans' Home, Saint Mathew's Home for Aged Women, Women's Home, Parkland Hospital (Pub.), Saint Paul's Sanitarium (R. C.), Cunningham Mission Home, Fowler Orphans' Home, Saint Joseph's Orphanage (R. C.), Dallas Free Kindergarten and Settlement Home, United Charities, and several smaller organizations and institutions.

Finance and Banking.—The city has five National banks (one of which is being organized, November 1903), with capital and surplus amounting to \$2,418,000; deposits, \$10,827,324; one private bank; one trust company, capital \$500,000; and 13 savings and loan companies. The National banks are designated as reserve depositories.

Parks and Cemeteries.—The parks are well laid out and most attractive. They are the City Park, Oak Lawn, Exall's, Oak Cliff, Spann's, and Zang's. The cemeteries are Greenwood, Oaklawn, Evergreen, Oak Cliff, the Hebrew, the Catholic, the Orthodox Jews', Odd Fellows', Masons', and two for the colored people.

Government.—The government is vested in a mayor and 12 aldermen, chosen biennially by the people, and a police commissioner and a fire commissioner, appointed biennially by the governor of Texas.

Growth and Population.—Since 1900, the last Federal Census, the area of the city has been extended from seven and one half to nine square miles. Pop. (1890) 38,067; (1900) 42,638; including recent addition, the population in 1900 was 46,268. Pop. 1903, est. 65,000. (The Dallas city directory estimates the population as 75,415.)

THOMAS FINTY, JR.,
(Dallas Morning News.)

Dalles, The, or Dalles City, Ore., county seat of Wasco County; on the Oregon Railroad. It is about 30 miles northeast of Mount Hood, and on that portion of the Columbia River (on the Washington State boundary line) where the scenery is noted for grandeur. It is situated in a sheep and cattle-raising country, hence its trade is largely in cattle and wool. Fruits grow here in the Columbia Valley. Its chief industries are flour and grist milling, and wool scouring. A military post at Fort Dalles was established in 1838, and about the same time a mission was opened by the Methodist Church. The railroad station is known by the name of Dalles, and the local name often used is Dalles City; but the name of the post-office is The Dalles. Pop. (1900) 3,542.

Dallin, Cyrus Edwin, American sculptor: b. Springville, Utah, 22 Nov. 1861. He studied at the Ecole des Beaux Arts, and the Julian Academy, Paris, and has since practised his art in Boston, where he is instructor in sculpture in the Massachusetts State Normal Art School. He is a member of various art societies and among medals received by him are the gold medal of the American Arts Association in 1888, and the first-class medal of the World's Columbian Exposition at Chicago, 1893. Among his most important works are the 'Pioneer Monument,' and the 'Angel' for the Temple, both at Salt Lake City; 'Sir Isaac Newton' in the Congressional Library; the 'Medicine Man,' Fairmount Park, Philadelphia; 'The Signal of Peace,' Lincoln Park, Chicago.

Dallinger, Frederick William, American lawyer: b. Cambridge, Mass., 2 Oct. 1871. He was graduated from Harvard 1893, and the Harvard Law School in 1897, and was admitted to the Suffolk bar in 1897. He was a member of the lower House of the State legislature in 1894, and of the State Senate 1896-9. He has published: 'Voters' Pocket Manual' (with Pryor) (1892); 'Manual of Civil Government for Use in Public Schools' (1893); 'Nominations for Elective Office in the United States' (1896).

Dallinger, William Henry, English scientist and clergyman: b. Devonport, England, 5 July 1842. He entered the Wesleyan ministry in 1861 and after being minister at Liverpool 12 years was governor of Wesley College, Sheffield, 1880-8. His microscopical researches began in 1870. He became Fellow of the Royal Society in 1880, has been Rede lecturer to the University of Cambridge, lecturer at Oxford and at the Royal Institution, and was president of the Royal Microscopical Society 1883-7. He has published 'Minute Forms of Life' (1886); 'The Origin of Life' (1878); 'The Creator and What we may Know of the Method of Creation' (1887); revision of Carpenter's 'The Microscope and its Revelations' (1891).

Dalma'tia, a province of Austria, and the most southern crownland of the Austrian dominions. It consists of a long, narrow, triangular tract of mountainous country, and a number of large islands, along the northeast coast of the Adriatic Sea. In breadth it is very limited, not exceeding 40 miles in any part. The surface is much varied: a ridge of limestone mountains separates the north portion from

DALMATIAN DOG — DALNY

Bosnia, and another runs nearly parallel with the coast, sterile, and destitute of soil. The highest peak is Orien, 6,225 feet. The waters of many of the Dalmatian streams have a petrifying quality, and cover the rocks over which they flow with a coarse stalagmitic deposit. The country is not rich in metals, although in ancient times it is said to have produced gold. In mineral wealth Dalmatia is the poorest of the Austrian provinces, but some brown coal and asphalt are obtained, also manganese ore and salt. Most of the islands are mountainous, and present the same general aspect as continental Dalmatia, but are valuable for their productions, such as timber, wine, oil, cheese, honey, salt, and asphalt; and in several of them ship-building is carried on to a considerable extent. In summer the prevalent wind on the coast is the mistral, or northwest wind, which moderates the excessive heat of the season. The climate of Dalmatia, generally, is warmer than in any other part of the Austrian dominions.

Agriculture is in an extremely backward state, but it is said to have shown considerable improvement of late. The principal agricultural productions are maize, rye, barley, figs, olives, and vines; but sufficient grain is not produced to supply the wants of the country. Dalmatia has hardly any manufactures worthy of the name. A kind of coarse cloth used by the peasants is made. The production of silk has been introduced, and the soil is well suited to the growth of the mulberry-tree. There is a considerable manufacture of liqueurs at Zara, the principal of which is the far-famed maraschino.

The Dalmatians of the coast, and the principal families in the large towns of the interior, are mostly of Venetian extraction; and those who are of Hungarian origin have adopted the customs and language of the Italians. The latter is spoken in all the seaports; but the language of the country is a dialect of the Slavonic, which alone is used by the peasants in the interior. The Dalmatians are a tall, muscular, and vigorous race, generally hospitable, but lazy, vindictive, and dissipated.

The majority of the inhabitants are Roman Catholics, but there are also a considerable number of Greek Catholics. Education is generally diffused by the system of national schools, but it is of a very elementary character. Principal towns — Zara the capital, Spalatro, and Ragusa. Dalmatia was conquered by the Romans in the time of Augustus. In the 7th century it was taken by the Slavs, who founded there a kingdom that lasted till 1050, when the greater part of it was united to Hungary, and the remainder passed under the protection of Venice. In 1797 the Venetian portion, along with the city of Venice, was ceded to Austria; but in 1805, by the treaty of Pressburg, it fell into the hands of Napoleon, who first united it to the kingdom of Italy, and subsequently in 1810, to the kingdom of Illyria. The events of 1814 brought Dalmatia again under Austrian rule. A partial insurrection broke out against the government in October 1869, but was suppressed in the February of the following year. Dalmatia has a diet of its own of 43 members; and it sends 11 deputies to the Austrian House of Representatives. Pop. 593,784.

Dalmatian Dog. See COACH-DOG.

Dalmat'ic (*Dalmatica*), an ecclesiastical vestment, open at each side below the insertion of the

sleeves, which are wide. It is the principal vestment worn by the deacon in the Roman Catholic Church when ministering at the Mass, or in processions and in other functions. It is also worn under the chasuble, by bishops, when they celebrate the Mass pontifically; and it is a part of the vesture of a king both in England and in continental European countries. It is commonly of silk; its color varies according to directions of the ritual. The dalmatic was originally a long under-garment of white Dalmatian wool, but little different from the Roman tunic, and not till the fourth century was it a distinctively ecclesiastical garment. At first it was worn only by the Roman deacons, but later its use extended throughout the whole Church. So, too, the use of the dalmatic as part of the solemn attire of bishops was at first restricted to the Pope, but afterward was conceded to all bishops. In the Greek Church a vestment answering to the dalmatic, called stoicharion, is worn by deacons in solemn functions, and in the same Church the celebrating priest wears the stoicharion under the chasuble; but in this case the garment is always white. The two stripes, usually on the dalmatic, were originally purple, that is, a shade near scarlet, and were probably a survival of the *latus clavus* of the tunic of senators.

Dalny, däl'y-nī, Russia, city and free port 20 miles north of Port Arthur; at the east terminus of the Siberian Railway; connected with Saint Petersburg by the Central Manchurian Railway. It was established expressly for a commercial seaport by an edict of the czar of Russia, dated 30 July 1899. It was thrown open to the commerce of all nations 1 Dec. 1901. Dalny is situated on the Liao-tung Peninsula, which extends south into the Gulf of Pechili, China.

The harbor, in which vessels drawing 30 feet can enter at low water, is one of the finest and deepest on the Pacific. The surface of the bay is sufficient for all the shipping of China. Great piers are being built of blocks of stone and cement which weigh from 20 to 50 tons each. Seven railroad tracks and nine large warehouses are being constructed on the piers. A large break-water is being made across the pier harbors, which will allow ships to lie at the piers, and regardless of weather to load or unload.

The port will have no custom-house, but will be absolutely free, not even the small rates of Chinese customs being charged on goods being imported or exported. For the encouragement and development of commerce only the lowest possible rates will be required for tonnage, and the use of docks, wharves, and warehouses. The policy of low charges, the easy access to the harbor during all seasons of the year, the small labor needed to transfer goods from the ocean steamers to the cars, and the cheap coolie service will combine to make this the most economical shipping port in the Occident. The rules governing the city were approved by the emperor of Russia 16 Aug. 1899. The Chinese Railway Company is to build the city under the direction of the Russian minister of finance. Pop. (1903) 41,260.

Dalrymple, däl-rīm'pl, **Alexander**, Scottish hydrographer: b. Hailes, near Edinburgh, 24 July 1737; d. London 19 June 1808. In 1752 he went to India in the service of the East India Company, and while there made hydrography his

DALRYMPLE — DALTON

particular study. In 1795 he obtained the appointment of hydrographer to the Admiralty, as well as to the East India Company. His most important publications are: 'Discoveries in the South Pacific Ocean'; 'A Collection of South Sea Voyages'; 'A Relation of Expeditions from Fort Marlborough to the Islands of the West Coast of Sumatra'; 'A Collection of Voyages in the South Atlantic Ocean'; 'A Memoir of a Map of the Land Round the North Pole'; 'Journal of the Expeditions to the North of California'; 'The Oriental Repertory.' He was also the author of many historical and political tracts.

Dalrymple, Sir David, Lord Hailes, Scottish lawyer and antiquary: b. Edinburgh 27 Oct. 1726; d. 29 Nov. 1792. In 1766 he was made lord of session with the title of Lord Hailes, and later a lord of judiciary. He published 'Annals of Scotland' (1786), and other works on Scottish history, both ecclesiastical and political, antiquities, etc.

Dalrymple, James, 1st Viscount Stair, Scottish lawyer and statesman, b. Carrick, Ayrshire, May, 1619; d. Edinburgh 25 Nov. 1695. In the civil war he sided with Parliament, but soon relinquished that party, and became professor of philosophy at Glasgow. He then adopted law as a profession, and in 1670 was made president of the Court of Sessions. He was adverse to the severe measures adopted against the Covenanters, and having excited the enmity of the Duke of York, lost his appointments, and retired to Holland in 1682. Here he became a favorite with the Prince of Orange, who, after the revolution, created him Viscount Stair. Stair wrote: 'The Institutes of the Laws of Scotland' (still a standard authority); 'Philosophia nova experimentalis'; 'Vindication of the Divine Perfections'; 'An Apology for his Own Conduct'; etc.

Dalrymple, John, 1st Earl of Stair, Scottish statesman: b. 1648; d. 8 Jan. 1707. He was son of James Dalrymple (q.v.). He was called to the Scottish bar in 1672, and his eloquence and ability soon gained him a leading place in his profession, as later in the Scottish Parliament. Under Charles II. he suffered imprisonment twice for not sufficiently enforcing the persecuting acts, but held office in Scotland under James. He was largely instrumental in carrying out the 1688 revolution in Scotland, and for some time acted as the king's representative in that country, but his undoubted services have been somewhat discounted by his connection with the massacre of Glencoe in 1692. He assisted largely in bringing about the union between England and Scotland. He succeeded his father as viscount in 1695, and in 1703 was created earl.

Dalrymple, John, 2d Earl of Stair, Scottish general; b. Edinburgh 20 July 1673; d. there 9 May 1747. He entered the Cameronian Regiment in 1692, and in 1701 was appointed lieutenant-colonel of the Scots regiment of foot guards. In 1707 he succeeded to the earldom and became one of the Scottish representative peers, but still continued his military life, and distinguished himself in the campaigns of Marlborough, and more particularly at the battles of Oudenarde, Malplaquet, and Ramillies. On the accession of George I. he was appointed a privy counselor, and went on a diplomatic mission to France, where he attracted much notice by the splendor

of his retinue, and also displayed great skill and address. He returned in 1720, and for the next 20 years he took an active interest in agricultural pursuits. In 1742, on the dissolution of Walpole's administration, he again entered public life, and continued to act in different capacities, civil and military, till his death.

Dalsgaard, Christen, kris'ten däl'sgård, Danish artist: b. Krabbesholm, Jutland, 30 Oct. 1824. He studied at the Copenhagen Academy. Among his paintings, which deal mostly with Danish peasant life, are: 'Christmas Morning'; 'Jutland Peasants going to Communion'; 'Fisherman and Daughter'; 'Seizure for Debt'; 'One of the Wise Virgins'; 'Ansgar and Odbert Baptizing Mother and Child.'

Dalton, John, English chemist and physicist: b. Eaglesfield, near Cockermouth, Cumberland, 6 Sept. 1766; d. Manchester 27 July 1844. He was mainly self-educated, and showed such a decided turn for mathematics that he obtained the position of professor of mathematics and natural philosophy in New College, Mosley Street, Manchester, in 1793. The same year he published his early meteorological observations and essays. In 1799, on the removal of New College to York, he resigned his chair, but continued to give private lessons in the same branches. In 1808 he commenced the publication of his 'New System of Chemical Philosophy,' which, containing his brilliant discovery of the atomic theory, produced an important revolution in the science, gave him a very high place among philosophical chemists, and spread his fame over Europe. The Royal Society of London in 1826 admitted him a member, and unanimously awarded to him the first of two gold medals intended for those who had made the greatest discoveries in science. He was also elected member of the Institute of France, of the Royal Academies of Science of Berlin and Munich, and of the Natural History Society of Moscow. See 'Life,' by Lonsdale (1874); Roscoe and Harden, 'New View of the Origin of Dalton's Atomic Theory' (1896).

Dalton, John Call, American physiologist: b. Chelmsford, Mass., 2 Feb. 1825; d. New York 11 Feb. 1889. He was graduated at Harvard in 1844 and at Harvard Medical School in 1847. He was successively professor of physiology at the University of Buffalo, at the Vermont Medical School, at the Long Island College Hospital, and at the New York College of Physicians and Surgeons. He served as an army surgeon throughout the Civil War. His published works include: 'Human Physiology' (1859); 'Physiology and Hygiene for Schools, Families and Colleges' (1868); 'The Experimental Method of Medicine' (1882); 'Topographical Anatomy of the Brain' (1885).

Dalton, Ga., city and county-seat of Whitfield County; on the Southern and the Nashville, Chattanooga & Saint Louis railroads; 100 miles northwest of Atlanta. It is a health resort, and the seat of Dalton Female College. It has canning factories, cotton compresses, flour-mills, foundries and machine shops, public schools, weekly newspapers, and a national bank. Pop. 4,315.

Dalton, Ga., Military Operations at (23-25 Feb. 1864, and 8-12 May 1864, including engagements at Buzzard's Roost Gap, Dug Gap,

DALTON-IN-FURNESS — DALTONISM

Rocky Face Ridge, and Varnell Station). Dalton is in the northwestern part of Georgia, where the Chattanooga and Atlanta R.R. is intersected by that from Cleveland, Tenn. By rail it is 38 miles southeast of Chattanooga. When Gen. Bragg was supposed definitely to have abandoned Chattanooga, 9 Sept. 1863, Gen. Halleck ordered Gen. Rosecrans to occupy Dalton, and there Bragg retreated after his defeat at Lookout Mountain and Missionary Ridge, 24-25 Nov. 1863. In February 1864 Gen. Grant ordered Gen. Thomas to seize the town. Thomas moved, reported that he could not carry the position, and the effort was abandoned. His movement cost the Union army about 300 killed and wounded, and the Confederates about 200.

Dalton, the first objective point of Sherman's Atlanta campaign, was held 30 April 1864, by Gen. J. E. Johnston, with 54,400 men. The approaches to the place were difficult, and it was practically impregnable. Early in May Sherman concentrated his grand army in and around Chattanooga for his Atlanta campaign. It was made up of the armies of the Cumberland, Tennessee, and Ohio, commanded respectively by Gens. Geo. H. Thomas, J. B. McPherson, and J. M. Schofield, aggregating 98,797 men and 254 guns. The Army of the Cumberland had about 60,000 men, the Army of the Tennessee 25,000, and the Army of the Ohio, 14,000. On 6 May the Army of the Cumberland was at and near Ringgold, the army of the Tennessee at Gordon's Mill, on the Chickamauga, and the Army of the Ohio near Red Clay, on the Georgia line, north of Dalton. The four corps of Thomas and Schofield were ordered to move on Dalton in front, while McPherson with two corps moved through Snake Creek Gap. On the 7th McPherson was ordered to march from Gordon's Mills through the Gap to Resaca, 18 miles south of Dalton. He marched by way of Ship's Gap and Villanow, pushed through Snake Creek Gap, a wild defile, nearly six miles

long, 15 miles south of Buzzard's Roost, and on the morning of the 9th drove back Grigsby's Kentucky cavalry brigade, and marched to within a mile of Resaca, then held by two brigades under Gen. Cantey. Finding the place too strong to be assaulted, McPherson fell back to a strong position at the east end of the Gap. Meanwhile Thomas and Schofield had pressed forward. Thomas drove the Confederates in his front full through Buzzard's Roost Gap, and Schofield closed down on Thomas' left. On the 8th there was heavy skirmishing between Thomas and the Confederate divisions of Stewart and Bate at Buzzard's Roost, and about six miles farther south a determined assault.

The road from Lafayette to Dalton passes through a cleft in the palisade, which had been deepened and widened, hence known as Dug Gap. Geary's division attacked this gap. Skirmishers were thrown out who drove those of the enemy from the foot of the ridge and up the road nearly to the summit, when two brigades were formed in double lines on either side of the road. The Confederates were driven clear to the summit. The position of the Gap could not be carried, and an assault on the perpendicular palisade south of it was ordered, where it was broken by a few clefts through which four or five men could move abreast. The men charged, a few reached the summit, to be killed or captured, and the assault failed. After a short breathing-spell another effort was repulsed with much loss. Still another attempt was made by a single regiment, but it also failed. Everywhere the assault was repulsed, and the Federals withdrew after a loss of 306 killed and wounded, and 51 captured or missing. It is doubtful if the Confederate loss exceeded 30 men. At Varnell's Station Stoneman's and Wheeler's cavalry divisions had an engagement in which the loss was about 150 on each side, and Thomas pressed so vigorously in front of Buzzard's Roost that the heavy skirmishing attained the dimensions of a battle. By the 11th Sherman moved his army to pass through Snake Creek Gap. On the evening of the 12th Johnston was fully informed of the movement toward his rear, which had been covered by the ridge and the forests of the country, and he abandoned his position that night to give Sherman battle at Resaca. On the morning of the 13th Howard occupied Dalton. The Union loss around Dalton, 7-12 May, was about 830 killed and wounded; the Confederate loss not more than half that number. Consult: 'Official Records,' Vol. XXXVIII.; Van Horne, 'History of the Army of the Cumberland,' Vol. II.; Johnston, 'Narrative,' Sherman, 'Memoirs,' Vol. II.; Cox, 'Atlanta'; the Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

Dalton-in-Furness, England, town in Lancashire, and 30 miles northwest of Lancaster by the Furness Railway. In its vicinity are extensive iron works, rich hematite iron-ore mines, and the ruins of the magnificent abbey of Furness. Dalton Castle, an old tower in the town, was formerly associated with Furness Abbey. The painter Romney was born and buried here. It is connected with the Irish Sea by a canal three miles long. Pop. (1901) 13,020.

Daltonism. See COLOR BLINDNESS.

DALTON'S LAW — DAMAGES

Dalton's Law. See PNEUMATICS.

D'Alviella, dāl-vē-ēl-lā, COUNT Goblet, gōb-lā, Belgian savant: b. Brussels 10 Aug. 1846. He was educated at Brussels and Paris and in 1879 married a Miss Packard of Albany, N. Y. He is a member of the Royal Academy of Belgium and of the Royal Asiatic Society of Great Britain. He was for some time director of the 'Revue de Belgique,' was Hibbert lecturer at Oxford University in 1891, and has published 'Sahara and Lapland' (1874); 'Inde et Himalaya' (1877); 'Contemporary Evolution of Religious Thought in England, America and India' (1885); Hibbert Lectures on 'Origin and Growth of the Conception of God' (1892); 'The Migration of Symbols' (1894); 'Ce que l'Inde doit à la Grèce' (1897); and other works in French.

Daly, Charles Patrick, American jurist and author: b. New York, 31 Oct. 1816; d. 19 Sept. 1899. He had a distinguished judicial career in his native city, becoming justice of the court of common pleas in 1844, first judge of the court in 1857, and chief justice in 1871, retiring on account of age in 1886. He was president of the American Geographical Society for many years prior to his death. His works include: 'First Settlement of Jews in North America'; 'What We Know of Maps and Map Drawing Before Mercator,' and similar investigations.

Daly, John Augustin, American dramatist and theatrical proprietor: b. Plymouth, N. C., 20 July 1838; d. Paris 7 June 1899. In 1869 he opened his Fifth Avenue Theatre in 24th Street, New York; and after its destruction by fire in 1873 he opened its successor in 28th Street. In 1879 he opened Daly's Theatre in Broadway. Among his original plays are 'Divorce'; 'Pique'; 'Horizon'; 'Under the Gaslight.' He also wrote: 'Peg Woffington, a Tribute to the Actress and the Woman.'

Daly, Joseph Francis, American lawyer: b. Plymouth, N. C., 3 Dec. 1840. He was educated in New York, studied law and was admitted to the bar there in 1862. He was judge of the court of common pleas, 1870-96, and chief justice of the same 1890-6. He was also justice of the Supreme Court 1896-8. He was one of the founders of the Players' Club in New York and was president of the Catholic Club 1894-9.

Dalyell, or Dalzell, Thomas, Scottish soldier: b. about 1599; d. 23 Aug. 1685. He was taken prisoner fighting on the royalist side at Worcester, and afterward escaped to Russia, where he was made a general. Returning to England at the Restoration, he was made commander-in-chief of the forces in Scotland, and made himself notorious for his ferocity against the Covenanters.

Dalzell, John, American lawyer: b. New York 19 April 1845. He removed with his parents to Pittsburg in 1847, was educated at Yale and after studying law was admitted to the bar in 1867. He has practised his profession in Pittsburg and has been an attorney for the Pennsylvania Railroad Company for its western lines for many years. He has been a Republican member of Congress from 1887 and served on the Ways and Means Committee in the Fifty-fourth and succeeding Congresses.

Dalziel, Edward, English painter and illustrator: b. Wooler, England, 5 Dec. 1817. He went to London in 1839 and became associated with his brother George in painting, drawing, and wood engraving, the firm of the Brothers Dalziel having been for half a century well known in relation to illustration of a high character. He has exhibited at the Royal Academy and Royal Institute of Painters in Oil, and with his brother wrote: 'The Brothers Dalziel: a Record of Fifty Years, 1840-1890.'

Dalziel, George, English wood engraver: b. Northumberland 1816; d. Hampstead 7 Aug. 1902. He was a brother of Thomas Dalziel (q.v.) He established himself in London where he was joined by his two brothers, and the firm soon became famous for the excellence of its illustrated works, the best artists in England being engaged to draw blocks for their use.

Dama, dā'mā, a genus of the deer family (*Cervidae*), comprising the common fallow deer (*Dama vulgaris*) and the Persian fallow deer (*D. mesopotamica*). The name is also given to a species of large gazelle (*Gazella dama*) found in the Sudan. It is allied to the mohr (q.v.), but with relatively shorter lyrate horns and no dark stripe on the flanks. Closely allied to it also is the aoul (q.v.) of Somaliland.

Dam'ages, the indemnity recoverable by a person who has sustained an injury, either in his person, property, or relative rights, through the act or default of another; also, the sum claimed as such indemnity by a plaintiff in his complaint. Compensatory damages are damages allowed as a recompense for the injury actually received. Consequential damages are those which though directly, are not immediately consequential upon the act or default complained of. Exemplary, vindictive or punitive damages are, in legal contemplation, synonymous terms. Exemplary damages would seem to mean such damages as would be a good round compensation, and an adequate remedy for the injury sustained, and such as might serve for a wholesome example to others in like cases.

Where injuries are maliciously, wantonly, or recklessly inflicted, the right of the jury to award punitive damages is said to be as old as the right of trial by jury itself, and is not, as some seem to suppose, an innovation upon the rules of the common law. In England as early as 1763, it was declared that the jury had done right in giving punitive damages. (*Hackle v. Money*, 2 Wils. 205). And now, both in England and in the United States, the doctrine of punitive damages seems to be well settled, and the right of the jury to give such damages in a proper case cannot be shaken in any of the States by anything short of legislative enactments.

General damages are those which necessarily and by implication of law result from the default or act complained of. Special damages are such as arise directly, but not necessarily, from the wrongful act or default complained of. Parties entering into an agreement may estimate beforehand the amount of damages to result from a breach of the agreement, and may prescribe in the agreement itself the sum to be paid by either of the parties to the other by way of damages for such breach. Such damages are called liquidated damages, when sanctioned by the law. If, however, the agreement is such that the law

DAMAN — DAMASCUS

refuses to adopt it, then the damages agreed upon will be regarded as a penalty, or as in the nature of a penalty. General damages need not be alleged in the complaint of the person injured, nor is it necessary that any specific proof of damages be given to entitle the party injured to recover. The legal presumption of injury in cases where it arises is sufficient to maintain the action. Whether special damage be the gist of the action, or only collateral to it, it must be particularly stated in the complaint, as the plaintiff will not be permitted otherwise to go into evidence of it at the trial, because the defendant cannot also be prepared to answer it.

To constitute a right to recover damages, the party claiming damages must have sustained a loss; the party against whom they are claimed must be chargeable with a wrong; the loss must be the natural and proximate cause of the wrong. Where there is no loss there is no right to damages, properly so called. A sum in which the wrong-doer is mulcted simply as a punishment for his wrong, and irrespective of any loss caused thereby, is a "fine" or a "penalty," rather than damages. Damages are based on the idea of a loss to be compensated, a damage to be made good. It is not necessary, however, that this loss should always be distinct and definite, capable of exact description, or of measurement in money. A sufficient loss may appear, from the case itself, to sustain an action. A sufficient loss to sustain an action may appear from the mere nature of the case itself. The law in many cases presumes a loss where a wilful wrong is proved; and thus damages are also awarded for injured feelings, bodily pain, grief of mind, injury to reputation, and for other sufferings which cannot be made the subjects of exact proof and computation in respect to the amount of loss sustained.

Daman, *dā-mān'*, or **Damão**, India, a seaport town in Hindustan, at the mouth of the Gulf of Cambay, on the Damanganga or river of Daman, 100 miles north from Bombay. It belongs to the Portuguese, who sacked it in 1531, retook it in 1558, and have kept possession of it ever since. It carries on some cotton-weaving, fishing, ship-building and several salt works. Pop. about 6,000. The Portuguese district here of the same name possesses valuable teak forests. It has an area of 148 square miles. Pop. about 64,000.

Daman, *dā-man*, the Syrian name for the coney of Scripture. See **CONY**; **HYRAX**.

Damanhur, *dā-mān-hoor'*, Egypt, town of Lower Egypt, capital of the province of Beharah, an important railway centre and seat of cotton manufacture. Pop. (1897) 27,236.

Damaraland, *dā-mā'rā-lānd*, a district of German Southwest Africa, bounded on the west by the Atlantic Ocean. It is mountainous, some of the peaks ranging in height from low hills to elevations of over 8,000 feet. In some parts there are broad prairies, which could afford pasturage for thousands of cattle. In the mountains have been found rich deposits of copper. The produce of the interior consists of ivory, feathers, skins, etc. The Damaras, properly Herero, a Bantu stem, number about 80,000, of whom 50,000 live in the mountain district; they are nomads, and own large flocks and herds. The Hawkoim, or Hill Damaras, in the northeast, however, who are a much lower type, now speak Hottentot.

The only harbor in this part of the coast is Wal-fisch Bay, which properly belongs to Nama Land; it was annexed to Cape Colony in 1884. In the same year the desert region along the coast was made a German protectorate.

Damascene, *dām'a-sēn*, **St. John** (**JOANNES DAMASCENUS**, **JOHN OF DAMASCUS**), a monk and an illustrious theologian of the Greek Church in the 8th century, native of Damascus, b. about 700; d. about 755. He was the first to reduce to system the Church's dogmas and to classify the decrees of the General Councils concerning matters of faith; this he does in the third part of his work: 'The Fountain of Knowledge.' In the first part: 'Points of Philosophy,' he makes application to theology of the principles of Aristotle's *Dialectica*; the second part consists of a reproduction of Epiphanius' work: 'On Heresies,' with additional notices of heresies condemned by the Church after Epiphanius' time; the third and most valuable part is the 'Precise Exposition of the Orthodox Belief.' In mediæval times the 'Precise Exposition,' translated into Latin in the 12th century, gave direction to the theological views and speculations of the schoolmen; and hence Damascenus has been denominated the "Father of Scholasticism." Many other treatises are extant which bear his name as author, but of most of these the authenticity is doubtful. No contemporary account of his life has come down to us; the earliest biographical notice of him that we have dates from the 10th century, and that is unworthy of credit. The epithet: "Chrysorrhœas," that is, gold-streaming, bestowed upon him in his lifetime, testifies to his reputation for eloquence. He is recognized as a saint both in the Greek and the Latin Church.

Damascus, *da-māsh'ī-ūs*, a philosopher, so called from his supposed native place Damascus, lived in the beginning of the 6th century. He is known as one of the most distinguished teachers of the Neoplatonic philosophy. In Alexandria he studied rhetoric under Theon and mathematics under Ammonius; and afterward in Athens his teachers were Zenodotus and Marinus, the successors of the more celebrated Proclus. Numerous fragments of his writings remain, one of which is entitled: 'Doubts and Solutions respecting the First Principles.' It is so mystical as to be almost unintelligible, but it is important to the history of philosophy from its frequent notices of earlier philosophers.

Damas'cus (native name **DIMISHK-ES-SHĀM**, Syria), a celebrated city, capital of the Turkish vilayet of Syria, finely situated on a plain, at the eastern base of the Anti-Libanus range, supposed to be the most ancient city in the world. It is six miles in circumference, and is surrounded by a dilapidated wall. The plain on which the city stands is of great extent, and is covered with the most beautiful gardens and orchards, irrigated by the waters of the Barrada, forming a grove of more than 50 miles in circuit, rich in fruits, including oranges, lemons, citrons, pomegranates, mulberries, figs, plums, walnuts, pears, and apples. The interior of Damascus by no means corresponds with the beauty of its environs. The streets are narrow and crooked, paved with basalt, and have a gloomy and dilapidated appearance; they are generally in three divisions —

DAMASCUS BLADES

that in the middle devoted to cattle and riders being the lowest, and of the same width as the other two. In most parts of the city the fronts of the houses are built with mud, and pierced by a very few small grated windows, with red painted shutters. They are low, with flat-arched doors, resembling those of stables, while a dung-hill and pool of putrid water almost invariably stand before each door. In many of them, however, a singular contrast is presented between the dull, prison-like outer walls of gray mud and the richness within. Interiorly they are of a quadrangular form, enclosing a court paved with marble, ornamented with beautiful trees and flowering bushes, and having copious fountains playing in the centre. The lower rooms on each side of the court are raised above its area, and open in front—their roofs and walls highly ornamented with figures of flowers and inscriptions, and a variety of arabesque devices. The furniture, also, is of the most splendid description. The best and wealthiest part of the city is the Moslem quarter, where the streets are wider and cleaner, the houses higher and better built, and the supply of water much more abundant than in any other part of the town. The Christian and Jewish quarters are the most miserable.

Among the places most worthy of notice in Damascus are the bazaars. They are merely long streets—the principal one about one and a half miles in length—covered in with high wood-work, and lined with shops, stalls, stores, and cafés. The shops are narrow, and go only a short way back. There is a separate bazaar for almost every commodity exposed to sale, and all of them are patrolled by multitudes of confectioners and dealers in ices and cooled sherbets. In the midst of the bazaars stands the Great Khan, said to be one of the most magnificent structures of its kind. It is an immense cupola, supported on granite pillars, and built, in part, of alternate layers of black and white marble. Its gate is one of the finest specimens of Moorish architecture to be seen in the world. In this building, and in 30 inferior khans, purchases and sales are daily conducted by the merchants, who have their counting-houses near them. The principal mosque, a fine edifice, was destroyed by fire 14 Oct. 1893. There are three Latin monasteries in Damascus—those of the Franciscans, Capuchins, and Lazarists. The principal Roman Catholic churches form part of the monastic buildings; there are, besides, a number of detached churches belonging to different sects in various parts of the city. Besides the more remarkable architectural objects mentioned, there are an extensive citadel, and a serai or palace, in which the pasha resides. The most interesting locality in the city is, perhaps, what is called "Straight Street," mentioned in connection with the conversion of the apostle Paul. It is the most important, largest and busiest street in Damascus; is about one mile in length, and runs from east to west. The house of Judas, also, to which Ananias went, is still pointed out, as well as that of Ananias.

Damascus was formerly a great emporium of trade between Europe and the East, and still imports English cottons and other goods to the yearly value of about \$2,590,000. It is also a place of considerable manufacturing industry. There are a number of manufactories of silk, damasks, cotton, and other fabrics; numerous

cotton-printing and dyeing establishments, tobacco factories, copper and iron foundries, and glass works. The manufacture of Damascus blades, for which the city was once so celebrated, no longer exists. Saddles and bridles, rich and highly finished, fine cabinet work, and elegant jewelry, are among the manufactures of Damascus. It is one of the holy cities, and here the pilgrims assemble on their journey to, and separate on their return from Mecca. Until a very recent period no Christian could walk the streets without incurring the risk of being insulted, and probably maltreated, by its fanatical population; and no farther back than the year 1860 a considerable number of Christians were massacred by the bigoted Moslems. This intense hatred of the Frank, however, is now considerably abated.

Damascus to-day is perhaps the most thoroughly Oriental in all its features and characteristics of any city in existence. Of its origin nothing certain is known. There is, however, abundant evidence of its great antiquity, as it is mentioned in Gen. xiv. 15, as existing 1913 B.C., and appears even then to have been a place of note. At subsequent periods it fell successively under the power of the Israelites under David, the Persians, Greeks, and Romans, attaining great eminence under the last. In 1516 it fell into the hands of the Turks. A Protestant mission and schools have long been in operation here. Beirut is the seaport of Damascus, and is reached by a road 70 miles long. A railroad has been constructed from Beirut, and one from Damascus to the Hauran. Gas and street cars have recently been introduced. Pop. (estimated for 1898) 225,000, of whom perhaps 25,000 are Christians.

Damascus Blades, swords or scimitars formerly made chiefly at Damascus. These famous weapons, though in use among nations little skilled in the metallurgic arts, long before the Christian era, and made familiar to the European nations from the time of the crusades, long defied all attempts at imitation. It appears that the Indian wootz was in ancient times carried from the region of Golconda in Hindustan (where, as well as in Persia, it still continues to be manufactured by the original rude process), and at Damascus was converted into weapons. These were particularly distinguished for their keen edge, capable of severing heavy iron spears or cutting the most delicate gossamer fabric floating in the air; and for the peculiar watered appearance of the steel, which was covered with delicate black, white, and silvery veins, parallel to each other or interlaced. The Damascus appearance may be given to iron by welding together bars of different degrees of hardness, drawing them down, and repeating the process several times. (See DAMASCUS IRON.) Karsten suggests that by the use of bars of good steel the best Oriental blades may have been fashioned in this way. The "mosaic" process differed from the other by cutting the bar into short lengths and fagoting these pieces, the cut surfaces always being placed so as to face outward. Blades of great excellence were thus produced, but still inferior to the genuine Damascus. It was not till after the investigations of Gen. Anossoff in the first half of the 19th century that successful reproductions were obtained. These researches led to the

DAMASCUS IRON—DAMASK MANUFACTURE

establishment of works at Zlatoosk in the Ural Mountains, where Anosoff manufactured Damascus steel by processes of his own invention. According to his best method 11 pounds of iron were melted in the crucible with one twelfth as much graphite and one thirty-second part of scales of iron. All his sword blades were tempered in boiling grease. The process of bringing out the watered appearance was accomplished by the use of a diluted acid, which acts more upon the ground than upon the lines. The Zlatoosk weapons proved to be of properties similar to those of the old Damascus blades. Gen. Anosoff with one of them cut through floating gauze. Bones and nails may be cleft without injury to blades tempered for such use, and other steel tempered to the same point may be nicked by them without causing a gap. Their elasticity is so great that one may put his foot upon the end of the blade and bend it to a right angle, when it will fly back perfectly unchanged. Gen. Anosoff died in 1851, and his successor at the works failed to produce the remarkable blades for which the establishment had become celebrated.

Damascus Iron, or Damascus Twist, iron produced by the following method: Twenty-five alternate bars of iron and mild steel, each about 2 feet long, 2 inches wide, and $\frac{1}{4}$ inch thick are united by welding; the *fagot* being drawn into a bar $\frac{3}{8}$ inch square, is cut into lengths of 5 or 6 feet. One of these pieces is heated to redness, and one end is held firmly in a vice, while the other is twisted by a wrench or tongs, which shortens the rod to half its length and makes it cylindrical. If two of these twisted pieces are to be welded together, they are turned in diverse directions, one to the right and the other to the left; these are laid parallel to each other, welded and flattened. If three rods be used, the outside rods turn in a direction the opposite of the middle one, and this produces the handsomest figure. By these operations the alternations of iron and steel change places at each half revolution of the square rod, composed of 25 laminæ, the external layers winding round the interior ones; thus forming, when flattened into a ribbon, irregular eccentric ovals or circles. The fineness of the Damascus depends upon the number and thickness of the alternations.

Damask, a textile fabric, the ground of which is bright and glossy, with vines, flowers, and figures interwoven. At first it was made only of silk, but afterward of linen and woolen. According to the opinion of some, this kind of weaving was derived from the Babylonians; according to others, invented at a later period by the inhabitants of Damascus, from which latter place it is known to have derived its name. The true damasks are of a single color. In modern times the Italians and Dutch first made damask; and Europe was supplied, as late as the 17th century, from Italy alone, chiefly from Genoa. But the French soon imitated it, and now surpass the Italians. Damask is made in great quantities in Germany, chiefly in Upper Lusatia. *Dunfermline* is the chief seat of the manufacture of damask linen in Scotland, and *Lisburn* (q.v.) and *Ardoyne* in Ireland.

Damask Designing and Manufacture. To trace the origin of the art of weaving, or to ascertain the name of the artisan whose necessities led him to devise the crude appliance capa-

ble of being used in the production of even the very coarsest woven material, would be a hopeless task indeed, separated, as we are, from a period so exceedingly remote by the impenetrable gloom and obscurity which must ever enshroud the events of three or four score centuries ago. And yet we are safe in assuming that the ability to produce woven fabrics by means of a loom, no matter how elementary in construction, far antedates all written history, carrying us back to those early ages when the first rays of the sun of progress were faintly discernible above the horizon of time, awakening within our humble ancestors the desire for those things, which when obtained served to lighten their toil, and at the same time form part of the foundations of the noble structure, to which successive generations have contributed their share, and which we call civilization.

Coming down to a later period, however, we are enabled to gather authentic information regarding the degree of progress made in the art of weaving. Trustworthy records dating as far back as 2000 B.C. reveal the fact that the weavers of ancient Egypt were far advanced with the production of plain woven fabrics, many excellently preserved fragments of fine linen, which have been taken from the mummy cases of that period, testifying not only to the reverence with which they regarded the embalmed remains of their illustrious dead, but also to their skill and proficiency as weavers.

In the Bible also we find numerous references to the products of the loom. Job speaks of his days as being swifter than a weaver's shuttle (Job vii. 16). We also read that the draperies of the tabernacle and the veil of the temple were woven fabrics, richly embroidered with various colors. These allusions to the art of weaving, and others too numerous to mention, are scattered profusely throughout the pages of the sacred volume; while heathen writers of antiquity frequently allude to weaving as an art which was held in the highest esteem, and which furnished a favorite occupation for people representing every grade of society, from those who dwelt in the marble halls of princes down to the occupants of the most humble dwellings.

Nor was skill in weaving confined to one locality or people; an art so essential to the comfort and welfare of humanity at large, must speedily have become the common property of widely separated races; consequently we find that the Babylonish weavers of the year 1000 B.C. were celebrated for the richness and quality of their woven fabrics; while at the same period the patient Hindu and the stolid Chinese were producing fabrics of the finest texture on looms of the most primitive description.

From this it is obvious that the ancient races were familiar with the principles of fabric construction, and that they were able to produce a considerable variety of elementary weaves by using different varieties and counts of yarn in combination with each other; yet there is nothing to show that they were acquainted with any form of loom, the mechanism of which made possible the production of intricate floral or ornamental designs, such for example as could easily have been woven on the draw loom of a later period, or by its successor, the highly improved Jacquard power loom of the 20th century. This obvious drawback, however, they endeavored to overcome by means similar to those employed

DAMASK MANUFACTURE

by modern manufacturers of textiles, who, in order to meet the demand for showy and inexpensive fabrics of a certain description, are accustomed to arrange either the warp or filling in the form of a series of stripes of contrasting colors, harmoniously arranged together or else by changing the color of both warp and filling at such intervals as a previously devised pattern indicates, are enabled to produce an extensive variety of checkered patterns.

Designs of this character the weaver of ancient times found no difficulty in creating, but any large ornate or floral patterns with which he was familiar, were obtained either by printing, or the skill of the embroiderer, or when considered desirable, a combination of both added to the woven material after it had passed from his hands, and which as a result cannot be classed with those fabrics, which, produced entirely on the loom, are valuable on account of the elaborate nature of the designs with which they are embellished, as much as by the costliness of the materials employed in their construction.

It will thus be seen that a loom which could only be used in the production of a comparatively restricted variety of designs was sure to be superseded sooner or later by one of a more highly developed type, which would allow the decorative instinct of the early textile artist greater opportunity to express the ideas suggesting themselves to him.

In due time a loom capable of accomplishing these results was invented, probably in China, where, like so many other relics of the long forgotten past, it may be seen in operation at the present day, although long since consigned to the rubbish heap in all progressive countries.

From China the draw loom, as it came to be called, found its way to other parts of the globe. But it remained for the weavers of the ancient city of Damascus, the capital of Syria, to develop the possibilities of the new loom to the utmost extent, with the result that in time they established a large manufacturing and export trade in the beautiful silken fabric which soon became widely known as damask, taking its name from that of the city to which for centuries it brought wealth and renown, and in the manufacture of which the Damascene excelled all competitors.

In regard to the fabric itself, it and various other weaves, now passing under the same name, will be analyzed and described farther on, but any detailed description of the now thoroughly obsolete draw loom would be out of place and of no value to the average reader, but those desirous of making a thorough study of the subject will find their curiosity gratified by consulting the excellent treatise on hand loom weaving by Murphy, published during the early part of the 19th century.

Stated as briefly as possible, however, it may be said that the draw loom tie-up was a compound arrangement, one part of the harness being controlled by a lad known as the draw-boy, the other part controlled by shafts for the purpose of subdividing the warp, so as to form the fine ground weave peculiar to damask fabrics. Just as the weaver was about to throw the shuttle across the lathe, the warp, of which there may have been five, six, seven, or more ends to each mail, according to the quality of damask desired, was raised *en masse* by the draw-boy

in accordance with the requirements of a previously painted pattern, all the remaining warp being left down. The shuttle would thus have passed under the warp raised and over the warp left down without interlacing or forming cloth, had it not been for the supplementary arrangement of harness shafts, through which the entire warp was drawn, for the purpose of enabling every end to be used separately.

For each pick one of these shafts would be raised and one depressed, the others remaining undisturbed, the shaft which had been raised lifting every eighth end from among the mass of warp left down, the shaft which had been depressed carrying down with it every eighth end from the mass of warp raised, while the shafts which remained in a neutral position were so constructed as to permit the lifting of one portion of the warp and the sinking of the remainder as called for by the design, without interfering with the shed or passage of the shuttle. By this means the pattern was formed and the warp and filling interwoven so as to produce an eighth shaft satin or any similar weave required.

During the wars of the Crusades the draw loom, along with many other things Oriental, found its way into various European countries, thereby aiding greatly the development of weaving as applied to silk damask, brocade, velvet, and other fabrics; the great artists of the Middle Ages not considering it beneath their dignity to supply the necessary designs for these rich textiles. For centuries, however, the draw loom remained practically the same as when first introduced, but in the year 1604 a Frenchman named Simblot devised a method by means of which the draw-boy was enabled to raise the warp while standing at the side of the loom, instead of the top, as had been the custom previously.

In England also, during the 17th and 18th centuries, patents were taken out for several devices intended to render the services of the draw-boy unnecessary; these, however, soon passed from public view, but the draw-boy remained, toiling away at his monotonous task for many a day after the mortal remains of Jacquard had crumbled to dust.

In the United States the manufacture of the finer grades of silk and cotton damask and upholstery fabrics in general is of comparatively recent origin, the vast majority of looms devoted to this industry being located in Philadelphia, with lesser numbers scattered throughout New York State, New Jersey, Connecticut, and Virginia.

Twenty-five years ago the business was in its infancy, but "mighty oaks from little acorns grow," and to-day the manufacture of upholstery goods is one of the most important industries of the country, which, with allied trades, such as yarn-spinning, dyeing, and the manufacture of textile machinery, provides the means of livelihood for tens of thousands of operatives, and at the same time is a standing monument to the business enterprise of the American manufacturer. Nor have we by any means reached the limits of our development in this direction; the remarkable inventive ingenuity of the American artisan, which in many other lines of business has practically placed him beyond the reach of competition, will not be likely to fail him when applied to the weaving industry.

DAMASK MANUFACTURE

We will now consider the machine which time and experience has clearly demonstrated to be the most valuable contribution to the art of ornamental pattern weaving yet devised, and which owes its usefulness to the ingenuity of Joseph Marie Jacquard (an artisan of Lyons, France, born in the year 1752), although a large share of the honor bestowed on Jacquard is really due several others who endeavored during the early part of the 18th century to improve the draw loom. M. Falcon, for example, in the year 1728 invented a method of raising the warp by means of a chain of cards, on which a pattern was represented by holes perforated thereon, the cards being adjusted to a square cylinder also perforated to match a fully punched card. M. Vaucanson is also entitled to credit for improving the cylinder and causing it to revolve and move backward and forward with the cards. He also invented the griffe, which had for its object the raising of the warp; but these inventions, although constituting the essential features of the Jacquard machine, never passed beyond the realm of experiment until about the year 1801, when profiting by the experience of his predecessors after careful study of the problem, Jacquard introduced the machine which bears his name, and revolutionized the art of weaving.

The Jacquard machine may be defined as a piece of mechanism placed above a loom for the purpose of raising warp in any possible order a previously designed pattern may indicate.

The framework is of iron, strongly built, in order that the various parts may stand the strain to which they are subjected during the process of weaving. The steel hooks or wires which raise the warp are placed in an upright position, the needles occupying a horizontal position. Every needle is connected to a hook in such a manner that when the needle is pressed back by a card the hook is carried back also. A spring at the end of each needle sends both hooks and needles back to their original position. Each hook has a crook at the lower as well as the upper end. To the crook at the lower end the harness cords are fastened, and at the lower end of the harness cords the heddles are attached. In the centre of each heddle a small metal eye called a mail is fastened. Through the eye of the mail the warp is drawn. Below each heddle an iron weight called a lingo is attached for the purpose of keeping harness cord, heddle, mail, and warp in the proper position.

An important part of the machine is called the griffe. It is an oblong iron frame containing as many strips of iron called the bars, or knives, as there are rows of hooks lengthways in the machine. Each of these bars rests directly under the upper crooks of the hooks. The griffe has a rising and falling motion. When it moves upward it raises all the hooks whose upper crooks rest directly above the bars or knives, allowing those hooks which have been pushed aside by the card to remain down.

Another important part of the machine is the cylinder, on which the cards are carried backward and forward, to and from the points of the needles when the loom is in operation. It has four sides, each side being perforated with as many holes as there are needles in the machine, or holes in a fully punched card.

To control the movement of the hooks a pattern is painted on squared design paper. If it is to be woven by means of a 400 machine the designer cannot use more than 400 small squares from right to left on design paper; or, if the pattern is to be woven by a 600 machine, he cannot exceed 600, or 1,200 if made to suit a 1,200 machine, unless he makes use of hooks belonging to two extra rows, with which Jacquard machines are usually furnished. Neither is he compelled to use the full number of hooks available, as the pattern may be subdivided into two, four, six, or any number of parts required, but it would be necessary to paint out the full extent of the design unless the first part could be reproduced on an even number of rows, in which case the card stamper would go over the part painted as often as necessary, in order to indicate the complete number of harness cords on the card.

When the pattern has been completed it is given to the card stamper, who punches holes in the cards wherever the design indicates that warp is to be raised.

When the cards have all been cut they are laced together in regular rotation and placed upon the cylinder, around which they revolve in an endless chain. The loom is then started, and the cylinder carrying the cards with it moves toward the needle points, against which they are pressed. Where no holes have been punched, the card forces the needles back. The needles carry the hooks with them out of the way of the griffe bars, which rise at the same moment. This allows the warp to remain down, resting on the shuttle race, but where holes have been punched in the card, the needles enter, allowing the hooks to remain undisturbed, their upper crooks resting directly over the griffe bars, which, when rising, lift hooks, harness cords, and warp, forming a shed through which the shuttle passes.

From this it will be evident that to raise warp, holes must be punched in the card, and where warp is to be left down, the card must be left uncut. The Jacquard machines generally used in the manufacture of upholstery fabrics range in capacity from 624 to 2,608 hooks. Within recent years a new machine known as the fine index Jacquard has come rapidly into favor. It is more accurately built than the older type known as the French index machine, and contains 80 full rows of 16 holes, and 24 extra holes on the peg hole rows, or a total of 1,304 holes on one card, a little larger than a 624 hook French index card.

For weaving fine damask goods, the machines generally used are known as double lift, single cylinder Jacquards, while manufacturers of such fabrics as turkey red damask table covers, use the double lift, double cylinder machine; another Jacquard called the rise and drop machine is also much used by upholstery goods manufacturers, these Jacquards being operated at a considerably higher speed than is obtainable with an ordinary straight lift, single acting machine.

In the double lift single cylinder machine, for example, there are double the number of hooks contained in a single lift Jacquard of the same capacity; although each has the same number of needles, there are also two griffes which work alternately, thus enabling the loom to be driven at a higher rate of speed, each griffe and the hooks it controls coming into operation at

DAMASK.

Silk Damask Curtain. Designed by William Laird Turner. Exhibited by the Philadelphia Textile School at the Chicago World's Fair. 210 ends per inch. 120 picks per inch. Pattern on design paper covered 174 square feet. 28,320 cards required to form the design on cloth, which placed end to end would extend a distance of $7\frac{3}{4}$ miles. The largest pattern designed in the United States, up to 1893.

DAMASK MANUFACTURE

each alternate pick only, thereby avoiding unnecessary friction of both machine and warp.

In the double lift, double cylinder Jacquard, the pattern cards are divided into two sets, all odd-numbered cards being placed on one cylinder, and evenly numbered cards on the other. When the loom is in operation the cylinders come into play alternately, the odd cards and cylinder for the first pick, the even cards and cylinder for the second pick, and so on, each cylinder working at the rate of about 70 picks per minute, or 140 for both.

In addition to these machines there are a considerable variety of other makes adapted or modified to suit special conditions. The twill Jacquard, for example, designed to weave fine damask and other fabrics requiring a great number of warp ends with a machine of small hook capacity, the Jacquard in this case weaving both figure and ground, thereby greatly reducing the cost of designing and card-stamping. The cross border Jacquard is the name given to another style of double cylinder machine used for weaving table covers and border fabrics. In this case the cards for weaving the border are placed on one cylinder, and those forming the centre on the other, each cylinder being called into action to weave its own part of the pattern only.

Other varieties of machines might be mentioned, but those already referred to are sufficient to show that a Jacquard machine which might be perfectly adapted to a certain class of work would probably be of little use for anything else.

The "tie-up" is the technical term applied to the method by which the various harness cords controlling the warp are connected to the hooks of the machine, in order to form the elaborate patterns required for Jacquard woven fabrics in general.

The tying up may be accomplished in the three following ways: (1) By what is termed the straight tie method; (2) by the point or centre tie method; and (3) by those two methods in combination.

When the harness is tied up so that each end in the warp is controlled by a separate hook, it is known as a straight through single tie, which, for designing purposes is the best possible arrangement of the harness cords, as it enables the designer to execute a pattern extending from selvage to selvage without being compelled to repeat any portion unless found desirable. This method of tying up is rarely ever used, however, unless for narrow fabrics, or large panels woven in imitation of Gobelin tapestry, on account of the great expense it would necessarily involve for designing and card stamping, the manufacturer finding it much more economical to use the straight repeated tie, or the point tie, by means of which he could weave with a 1,200 machine, a damask or tapestry curtain, for example, containing 9,600 warp ends, in the full width of the fabric, by tying up the harness so that the pattern would be repeated eight times, to accomplish which the comberboard would require to be separated into eight equal divisions, each containing 1,200 holes and the same number of harness cords, the first cord from each division being connected to the first hook, the second cord from each division to the second hook, the third cord from each division to the third hook, and so on, so that by raising any

particular hook eight warp ends would be lifted, one from each division, all forming a portion of the design exactly alike, each in its own division.

From this it will be evident that the number of times a pattern may be repeated in the width of the fabric depends upon two things. In the first place, upon the number of hooks which the machine contains, and in the second place, upon the texture of the fabric to be produced, the finer the texture the greater the number of hooks necessary, in order to form a wide repeat.

The second tie-up referred to, the point, or centre tie, is generally adopted when the manufacturer desires a larger and more imposing style of design than is obtainable with the ordinary straight repeated tie.

For example, by using a 600 machine tied up straight, so as to give a warp texture of 100 ends per inch, the width of one repeat of the pattern would be limited to six inches, but by tying up the same number of ends per inch, using the point or centre tie method, the width of one repeat of the pattern would be 12 inches, and the number of harness cords and warp ends 1,200, controlled by 600 hooks.

This tie-up has one disadvantage, however, as it can only be used in the production of designs which are symmetrical, or alike on both sides of a line drawn from top to bottom, in the centre of the full repeat. In regard to the arrangement of harness cords for curtains, table covers, etc., for which this tie-up is much used, the first hook in the Jacquard machine is generally made to control two harness cords in the exact centre of the comberboard, the last hook controlling two harness cords, one of which is at the extreme left, and the other at the extreme right of the comberboard.

The combined point and straight tie is used principally for curtains, table covers, couch covers, and other fabrics requiring side borders, this method being adopted because the pattern repeat can be increased thereby. For fine weaves, however, a machine more limited in capacity than a 1,248 hook French index, or the 1,304 hook fine index Jacquard, will hardly be found serviceable, the 600 machine restricting the designer to very small patterns, which, while cheapening the cost of production a trifle on that account, and because fewer cards are required, would still be unprofitable, as the woven product could not compete with goods of the same texture ornamented with larger and more imposing designs; however, for cheap fabrics, such as turkey red damask, the 600 machine is commonly used, with the harness tied up to give a straight tie centre and a point tie border, with a warp texture of from 60 to 70 ends per inch, finished goods.

In medium grade fabrics the warp generally varies between 90 and 100 ends per inch, the 1,248 or 1,304 hook machine giving a curtain 50 inches wide, containing 4 straight repeats of 1,200 ends each, equal to 96 ends per inch, but as a curtain without a border is more or less unfinished, the machine could be used to greater advantage by dividing the hooks into two parts, the first 600 tied up point tie in three $12\frac{1}{2}$ inch repeats, and the second 600 tied up straight, so as to give two borders, each six and a quarter inches wide, by which means the full width of 50 inches would be secured.

DAMASK MANUFACTURE

For the finest fabrics where extensive single scale patterns are necessary, larger machines must be used, but if the cost of production must be reduced to a minimum, compound harness shafts may be used, with as many ends to each mail as are necessary to obtain the desired result.

When tying up has been completed, the loom is then ready for the warp, which for cotton damask and similar fabrics is generally delivered at the mill by the cotton spinner, undyed, and in chain form, spun to the counts or number wanted, the length of the chain and the number of ends it may contain varying to suit the requirements of different manufacturers, chains from 500 to 600 yards long and containing 1,200 ends being commonly used for 50 inch wide cotton damask fabrics, with a warp texture of 96 ends per inch, finished goods, a warp of this description requiring four chains, each containing 1,200 ends, in order to make up the full warp of 4,800 ends.

After the warp has been dyed the necessary color, it is sent to the beamer, who begins by taking the ends of the warp containing the pin lease, which he twists around several wooden pins on what is known as the rack, in order to regulate the tension with which it passes around another tension device, composed of three large hollow wooden rollers, or drums, as the beamers call them; the warp is then, by means of the pin lease, passed through the dents of a coarse reed suspended from the ceiling, then distributed over a second fixed reed to the required width, which is usually a little in excess of the width of the warp in the loom reed. Thence it is passed under two iron rollers, the second of which presses the warp down on the beam, causing it to go on firmly; it is then fastened to the beam, and the actual work begun, the beamer standing eight or ten feet from the beam, using the coarse hanging reed already referred to for the purpose of unraveling the warp, and causing it to pass through the fixed reed and on to the beam evenly, great care being exercised in order that all slack, crossed, or broken ends may be adjusted, this being absolutely necessary in order that the weaver may be saved annoyance and loss of time when the warp is in the loom.

The foregoing description applies to warps which can be beamed directly from the chain, but the warp for many varieties of cotton fabrics is not strong enough to stand the friction and strain of weaving, and requires different treatment previous to beaming.

Sea Island cotton, grown in the Fiji Islands, for example, has the longest fibre of any variety, the length of which runs from 1.25 to 1.90 inches, with the American variety of Sea Island cotton a close second, it varying between 1.60 and 1.80 inches, while Texas grown cotton is shorter in staple than any other variety, running between 0.70 and 0.95 inches. From this it will be seen that a single or slack twisted thread will be materially strengthened if coated with some starchy substance, the basis of which may be flour, starch, sago, or any other suitable medium. This is what is done, and the process involved is termed dressing the warp, special machines being required for the purpose.

Cotton, however, is not the only warp so treated. Linen warp for table damask is also dressed before beaming, the object being not only to enable it to stand the friction of weaving, but because by that means the cloth takes

on a superior finish, which is one of the desirable features of table damask, and which enhances its value accordingly.

In regard to silk, the most beautiful and costly yarn employed in the manufacture of textiles, it is extensively used both as warp and filling, in the finest grades of silk damask and brocades.

As it comes from the cocoon, or covering with which the silk-worm protects itself when in the chrysalis stage of its existence, it is too delicate to have any commercial value, but during the process of reeling four, five, or six threads are taken from as many cocoons and formed into one fine continuous thread, called singles, the reeling being accomplished by placing the cocoons in warm water, which softens the natural gum they contain and binds the group of separate strands into a single thread.

Tram silk is the name by which reeled silk filling yarn is known, two or more singles being loosely twisted together for that purpose.

Organzine is the name given to reeled silk warp yarn. It also is formed with singles, twisted separately, then doubled and twisted again, thus forming a remarkably strong and brilliant thread.

Spun silk is also in great demand for fine damask warps. It, however, has not the brilliancy of reeled silk, being formed with cocoons which have been pierced, or otherwise spoiled, and which, along with the refuse and waste accumulating during the reeling process, is torn up, then carded, and spun to the counts or number desired.

In regard to the warping and beaming of silk, it may be said that organzine and spun silk warp used in the fine silk damask trade, is bought in skein form, and in the gray, which, after being dyed, is wound on large bobbins, then transferred to the warping mills in sections, the creel on which the bobbins are placed not being large enough to hold all the bobbins necessary for the completion of the entire warp at one operation. After the warp has been put on the mill it is wound around the beam; when this is finished it is taken charge of by the twister, whose duty it is to twist the ends of the new warp to the corresponding ends of a short length of the old one which has been left in the loom for that purpose; but in the case of a new tie-up, or any change in the arrangement of the mails, which occurs when a straight tie for single warp fabrics is altered to suit a two or three warp weave, without cutting down the harness, the old warp would require to be taken out of the loom, and the new warp drawn through the mails and reed as required, before being ready for weaving.

Wool, jute, ramie, and other yarns are also used in the manufacture of damask fabrics, but the foregoing description will furnish a general idea of the warping, beaming, and twisting operations involved.

The next thing to be considered is the designing of patterns for Jacquard fabrics, this subject being one of vital importance to the manufacturer of high class ornamental textiles, the prosperity or decline of a business of this character depending in a great measure on the artistic ability of those responsible for each season's patterns.

Those unfamiliar with textile designing will probably imagine that the creation of new pat-

DAMASK MANUFACTURE

terns lies entirely with the designer, which to a certain extent is true, but, generally speaking, the designer is the medium through which the ideas of the mill owner, manager, salesman, or other supposed expert find expression. If this important work is performed by a man of refined taste, in close touch with the trade, and always on the lookout for novel ideas in weave and design, if he is or has been a good original designer, and is familiar with fabric construction, so much the better. The business fortunate enough to possess a man with these qualifications will always secure its share of whatever trade is being done; but, unfortunately for some manufacturers, the designer is looked upon as of no more value to the firm than the man who oils a machine and keeps it running, while the head of the department may recently have been employed as a weaver or card-stamper, who, because of fancied executive ability, has been placed in charge of this important department, with the result that his first thought is to secure the cheapest men on the market, who produce work, which, from lack of proper training, he cannot perceive to be common and devoid of originality, and which, instead of creating dividends, will in time sap the foundations of what might have been, under proper direction, a profitable business.

Among small manufacturers the usual custom is to buy all patterns required from designers who work for the general public, but large concerns as a rule consider it more advantageous to employ a staff of draughtsmen, under the supervision of a head designer, who, in addition to ability as an artist, originator, and colorist, should be familiar with the Jacquard machine, the various methods of tying up, card stamping, and fabric construction. Men with these qualifications are not easily obtained, the technical man as a rule being of no use as an originator, while the designer capable of executing good original work, generally looks with indifference, if not contempt, on the various mechanical operations by which the design is transferred to the cloth, and fails to realize the importance of mastering these details until he finds himself outclassed by one who equals or excels him as an artist, and who, in addition, has burned the midnight oil, in order to acquire the technical knowledge which renders his services valuable.

When the designer is commissioned to prepare a pattern for any of the finer grades of Jacquard fabrics, silk damask furniture covering for example, he first prepares a rough charcoal sketch, drawing the figures the same size as they will appear in the cloth; when satisfied with what he has done, he takes a sheet of tracing paper and goes over the drawing carefully, making the outlines definite, and introducing improvements wherever possible. This carefully drawn tracing is then transferred to a sheet of drawing-paper, on which a background of a suitable color has been previously painted. When this is accomplished, the sketch is painted to resemble the finished cloth, after which it is left for the manufacturer or his representative to decide whether or not it shall be given to the draughtsman to transfer to squared design paper.

On the other hand, some manufacturers consider it a waste of time to prepare a painted sketch, and in the case of designs for many of

the coarser grade of textiles, and for one warp one shuttle weaves, such as cotton or linen table damask they are right, a shaded outline sketch being sufficient, but for silk damask and other high grade upholstery fabrics, where fine drawing and careful coloring are essential, a cloth-size painted sketch should always be prepared, not merely as a guide to the draughtsman and colorist, but because it is the only way to secure the best results.

After it has been decided that the sketch may be proceeded with, it is given to the draughtsman to transfer to squared design paper, the simplest and best way to accomplish which is by using the diverging scale, by means of which the sketch may be speedily and accurately ruled into as many squares as there are large squares in one full repeat of the pattern on design paper. Suppose, for example, that the sketch was for cotton damask goods, a 1,200 Jacquard machine being used, the cloth texture being 100 ends warp and 50 picks per inch, 1,200 hooks in one full repeat divided by 100 hooks per inch shows one repeat of the pattern to be 12 inches wide. The design paper necessary for the reproduction of this sketch may be 16x8, 12x6, 8x4, or any paper giving the proportion of 100 ends to 50 picks. Supposing that the draughtsman decided to use 16x8 paper, he would ascertain the number of squares into which the sketch should be ruled from left to right by dividing 1,200 by 16, which would give 75, that being the number of large squares in one repeat of the pattern, on design paper. Should this, in his estimation, cut up the sketch into too many squares, he could rule it into half that number, and mark the design paper to correspond.

When the sketch has been squared in this manner, the drawing is copied free-hand from the small squares on the sketch to the larger ones on design papers, this being continued until the whole pattern is reproduced in outline. It is then checked out with colors, representing those on the sketch, although generally brighter and more definite in hue in order that the card-stamper may have no trouble. When this has been accomplished the work of the designer and draughtsman is at an end, and the pattern is given to the card-stamper to be reproduced on the cards.

For a considerable time after the introduction of the Jacquard machine this was one of the most tedious and expensive operations connected with pattern-weaving, the first appliance for perforating the cardboard being simply a common hand-punch used in accordance with the requirements of the design, a second person reading the order of stamping for the guidance of the one who used the punch.

At the present day the cards are stamped by the piano machine, so called because in some respects it is supposed to resemble the musical instrument of that name, the design being placed on a reading-board in front of the stamper, while the keys which control the punches are operated by the fingers, and the card moved along from row to row by means of two pedals, manipulated by the feet. The machines used for stamping damask and other classes of upholstery fabrics are the French index, made to stamp 12 holes to each row, and the fine index, 16 holes to each row, the card guide in these machines being adjustable and self-centring,

DAMASK MANUFACTURE

so that cards of different widths may be stamped thereon.

Before commencing to stamp from a design similar to that described, the card-stamper would rule the pattern into 100 divisions across, with lines drawn from top to bottom by means of a lead pencil, each of these divisions containing 12 small squares crossways to each line, corresponding to 12 holes in each row on the card, and 12 needles and hooks in the Jacquard machine, and the same number of ends of warp, the full 100 divisions corresponding to the 1,200 hooks forming the tie or repeat of the pattern, and all the various repeats in addition, by which the full width of the woven fabric is made up.

After the design paper has been ruled, the first half, corresponding to the first 600 hooks and ends, is placed in the reading frame and the work of stamping begun, the pattern being read from right to left, from the bottom line upward, each line corresponding to one pick on one-shuttle work, two picks on two-shuttle work, three picks on three-shuttle work, and so on. When both halves of the pattern have been stamped the cards are laced together by hand or machine, this work being generally executed by boys, who, when inexperienced, occasionally make mistakes by turning the cards around, or upside down, and lacing them when thus misplaced.

For example: a 600 Jacquard machine contains 52 full rows of holes, including the 2 extra rows; total, 624 hooks. If the cards are laced in proper rotation, but turned around so that the first hole in each card takes the place of the 624th, the position of pattern on the cloth would be reversed; that is, figures pointing to the right on design paper would point to the left on cloth, and *vice versa*. With some patterns this would make no difference, as for example, a design composed of two-sided figures, each side the reverse of the other, but should the pattern contain a motto, monogram, or initials, as is often the case with linen damask, to reverse the position of the letters would spoil them entirely.

Another mistake which occasionally happens completely destroys the pattern by cutting it into a series of disjointed stripes, running in the direction of the warp, is caused by lacing the cards in correct rotation, but upside down, thus putting the 12th row of holes in the place of the 1st, which, on a 12-row machine, would cause the 1st row of hooks to control the 12th row of harness cords, the 2d row of hooks to control the 11th row, and the 3d row of hooks to control the 10th row, and so on, which, occurring on every card, destroys the pattern in the manner described.

Genuine damask, the weaving of which will now be explained, may be distinguished from other damask fabrics, so-called, by the fact that both ground and figure are eight-shaft satin weaves, the ground formed by the warp and the figure by filling, or *vice versa*.

In the weaving of single-scale fabrics, each hook in the machine controls a separate harness cord, mail and warp end, in one repeat of the pattern, a 1,200 machine tied up to give 200 ends per inch would thus form a six-inch wide pattern, but if each hook were made to control two warp ends of the same counts, the pattern repeat would be extended to 12 inches, or 18 inches if three ends were used, 24 inches if four ends

were used, and so on, but as each group of ends is raised by a single hook, the outlines of the pattern are as a result coarser than if each end were controlled separately.

In order to form the fine ground weave it is necessary that the Jacquard harness be supplemented by an arrangement of shafts similar to those referred to when describing the draw loom; these shafts, which are placed between the reed and the Jacquard harness, have heddles containing extra long eyes, or loops, so that when occupying a neutral position the warp may be raised and depressed by the other shafts as the Jacquard harness is raising the warp in a mass to form the design. For example: when weaving a four-scale damask four ends are passed through each mail of the Jacquard harness, after which they are drawn separately through the heddles of the shafts in front, the first end through the first heddle of the first shaft, the second end through the first heddle of the second shaft, the third end through the first heddle in the third shaft, and so on, until the entire warp is drawn in. It will thus be seen that each shaft controls one eighth part of the entire warp and that if they are raised in proper rotation an eight-shaft satin will be formed.

The rising and sinking of these shafts is controlled by that part of the mechanism of the loom called the head motion, acted upon by the harness chain, certain balls called raisers and sinkers being arranged thereon, the raisers to lift and the sinkers to sink the shafts in the order necessary to form the weave, which for an eight-shaft satin may be as follows:

1st pick				1st shaft up, 5th shaft down.			
2d	"	4th	"	"	8th	"	"
3d	"	7th	"	"	3d	"	"
4th	"	2d	"	"	6th	"	"
5th	"	5th	"	"	1st	"	"
6th	"	8th	"	"	4th	"	"
7th	"	3d	"	"	7th	"	"
8th	"	6th	"	"	2d	"	"

One repeat of the ground weave is thus formed, and by raising and depressing the shafts in the same order for each successive pick the pattern and the exquisite satin weave for which fine damask is renowned, will be produced simultaneously.

The cost of production is greatly lessened by this method of weaving, as 4,800 hooks would be required to weave a pattern which could be produced by a 1,200 hook machine and a four-scale tie-up. It would also be necessary to paint the pattern on 4,800 small squares from right to left on design paper, as against 1,200 required by the four-scale tie, and if a fine index Jacquard is used, four cards would have to be stamped to represent every pick or line on design paper, instead of one as required by 1,200 hooks, thus giving the weaver four sets of cards to look after instead of one, all this additional labor and expense adding nothing to the value of the fabric beyond improving the outline of the pattern somewhat, which, however, for commercial purposes, would not justify the additional outlay, even if wholly practical.

When selecting the requisite design paper for these fabrics it must be remembered that a four-scale damask may contain 200 ends per inch, but as the entire number is controlled by 50 hooks, that number only must be considered. Should there also be 50 picks per inch, 8 x 8,

DAMASK MANUFACTURE

10 x 10, 12 x 12, or any paper of the same proportion would be suitable. When painting the pattern, red could be used to represent figure, with the ground left white paper, and as the interlacing or stitching together of warp and filling is effected by the shafts, such would not require to be indicated on the design. The stamping of the cards is regulated by the method of weaving, which, in the case of fine silk damask, showing more ground than figure, is usually accomplished with the face of the cloth down, as this lessens the strain on the hooks and also on the lever which raises the griffe. For example: by weaving an eight-shaft satin face up, seven eighths of the warp would be raised and one eighth left down for every pick, but by weaving the cloth face down, one eighth of the warp would be raised and seven eighths left down for each pick, thereby reducing the strain on the machine to a minimum, and at the same time facilitating weaving. The card-stamper would therefore stamp red figure wherever indicated on the design and miss white.

Among the various fine damask fabrics may be mentioned a double-scale one-shuttle weave used principally for upholstering furniture, and which, in the finer grades, is composed of spun silk warp and tram silk filling. In this case each hook controls two ends in every repeat, the Jacquard harness raising both ends as one, while a set of shafts lifts each end separately in order to form the fine satin ground weave. To make this clear, it must be explained that the cloth is woven face down, and that the cards are cut to raise all the warp indicated by the figure painted red on design paper, while the ground warp represented by white is allowed to remain down. From the warp thus left down the shafts raise every eighth end, but as they do not sink any of the warp which has been raised, in order to allow the shuttle to pass under and form figure, the interlacing of warp and filling in the figure part of the fabric must be indicated on design paper, and represented on the card, with the result that at every point of interlacing two ends are left down, except where a shaft happens to lift one when forming the ground weave, but this is purely accidental, as the stitching of the filling by the warp is always done with the object of showing the silk to the best advantage, and while an eighth or sixteenth shaft satin form of stitching could be designed to suit the raising of the shafts, the floating of the silk filling on the face, one of the beautiful features of this fabric, would as a result be destroyed. This class of silk damask is also woven with two and three filling systems, by means of the same arrangement of Jacquard harness and shafts.

When woven with two systems of filling it is known as two-shuttle work, or three-shuttle work when three filling systems are used. When only two colors are used to form the design it is called a two-steady-shuttle pattern, to distinguish it from the same class of damasks in which one shuttle is steadily employed throughout the pattern, while the other is changed from one color to another a number of times in every repeat of the pattern during weaving, thereby cutting one of the filling systems into a series of horizontal stripes of colors, which the skill of the designer must soften and blend into harmony, by proper selection and skilful use of the steady color.

When selecting square design paper to suit a two-shuttle pattern, only half the total number of picks per inch are taken into consideration. For example: a total of 90 picks per inch on cloth would be represented by 45 lines on design paper, but as two cards would require to be stamped to represent the two picks indicated on each line, the full 90 picks per inch are thus made up. In regard to the warp texture, this varies a little, but 180 ends per inch may be considered about correct, and as 180 ends in a double scale tie-up are controlled by 90 hooks the design-paper selected should be in the proportion of 90 ends to 45 picks per inch, 16 x 8, 12 x 6, 8 x 4, or any similar paper would be suitable.

When selecting colors to represent the cloth effect on design paper, yellow may be used to represent the steady shuttle, and red to represent the changing shuttle, it being unnecessary to represent the changes on design paper if a properly executed sketch has been prepared, and also because a change in shuttle is represented by one card only. The background of the pattern should be left white paper, and the stitching on long filling face floats may also be indicated with white, although black or some other color is preferable on account of white having a tendency to peel off.

In this case the cloth would be woven face down, and the cards stamped as follows: First card yellow pick, stamp yellow, miss white, stamp red plain, that is, one end up and one down. Second card red pick, stamp red, miss white, stamp yellow plain.

Analysis of card stamping: First card, yellow pick. Stamping yellow raises all the warp represented on design paper by yellow, and allows the yellow pick to go under and form figure on the face, except where stitching takes place as indicated by white on yellow.

Missing white, allows the warp to remain down in a mass, wherever indicated on the design, except where ends are raised, at regular intervals, by the shafts to form the satin ground weave.

Stamping red plain, raises one half of the warp and leaves the other half down wherever red is indicated on the design, thus forming a plain weave with the yellow pick and the warp on the back of the cloth.

Second card, red pick. Stamping red raises all the warp represented on design paper by red, and allows the red pick to go under and form red figure on the face, except where stitching takes place as indicated by white on red.

Missing white, allows the warp to remain down in a mass wherever indicated on the design, except where ends are raised at regular intervals by the shafts, to form the satin ground weave.

Stamping yellow plain, raises one half of the warp, and leaves the other half down wherever yellow is indicated on the design, thus forming a plain weave, with the red pick and the warp on the back of the cloth.

The lifting of the shafts to form a satin ground weave is generally accomplished by means of certain rows of hooks reserved at each end of the machine for that purpose, the order in which they are raised being indicated on the corresponding rows at the ends of both cards.

Brocatelle is the name given to another variety of silk damask containing several ends to

DAMASKEENING — DAMASUS

each mail. As originally woven, the warp was silk, and the filling silk, cotton, or wool. At the present time the term *brocatelle* is applied to a two-warp two-shuttle fabric used principally as furniture covering. Owing to the nature of the weave, the pattern, which may be formed by spun or organzine silk warp, on a tram silk filling ground, has a rich embossed appearance. The second warp, technically called the binder warp, may be either silk or fine cotton yarn, and is used for the purpose of stitching long floats of the tram silk pick on face and back, usually by means of four shafts forming a three-up and one-down straight twill; while the back pick is generally fine jute or linen the same color as the silk figure warp with which it forms an eight-shaft satin, also by means of shafts.

Designs for *brocatelle* should be treated in a bold conventional manner, with very little attempt at shading, which destroys the embossed effect of the pattern, and makes the fabric look cheap and common. The figure may be represented on squared paper by red, and the ground left white paper, and as the stitching on both picks is done by shafts, no indication of the same is required. The stitching of the silk pick by the binder warp is done by the head motion; but the satin weave formed by the silk figure warp and the backing pick, is indicated on certain rows at each end of the backing pick card, reserved for that purpose.

Brocade is the richest and most elaborate form of silk damask. It is structurally the same as the two- and three-shuttle damask referred to, but gold and silver filling are often used along with silk in order to enhance the beauty of the fabric.

In each case where reference has been made to the use of shafts they have been described as occupying a position at the back of the reed, and in front of the Jacquard harness, but during recent years a different method of using compound harness has come into use, the new shafts consisting of thin strips of wood hung lengthways, immediately below the Jacquard, and connected by means of cords to rows reserved at each end of the machine, for the purpose of raising them in satin order. The Jacquard harness cords are threaded through holes running from top to bottom of these shafts, so that when the Jacquard lifts, the cords are raised also without disturbing the shafts.

To illustrate: we will suppose that a 16-row fine index Jacquard is to be used for the production of double scale damask, with an eight-shaft satin ground. In this case the total number of ends in one repeat of the pattern would require to be divisible by eight, so that the satin might join at both sides of the repeat, and as the fabric desired is a double-scale weave, each row of 16 hooks would have to carry two shafts, equal to a total of 32 shafts, each controlling one thirty-second part of the warp, so that by raising four shafts in correct order for each pick an eight-shaft satin ground weave would be formed.

By using shafts in this manner there is less strain put upon the warp, as there is a separate harness cord and mail for each end, and no front shafts to trouble the weaver, who, as a result, will find it less difficult to tie in broken ends.

The cheaper grades of damask, embracing worsted hangings, table linen, cotton turkey red,

and several other one-warp, one-shuttle weaves are designed and woven on the same general principle, one hook controlling a single harness cord and end; in each repeat of the pattern the square design paper also being in proportion to the exact number of ends and picks per inch, one color on the design representing all the various satins, twills, and shadings of the cloth; while the cards are stamped, and the cloth woven face up, or face down, according to the nature of the particular weave.

WILLIAM LAIRD TURNER,
Teacher of Jacquard Designing, Philadelphia Textile School.

Damaskeen'ing, the art of inlaying iron or steel with other metals, especially gold and silver. It is also known as *damascene work*. This art is of great antiquity. Herodotus mentions a dish so ornamented; and the shields of some of the forces of the Samnites who fought against Rome were damaskeened. This method of ornamentation was formerly much used in Damascus and is found in modern Persian objects of art. The most beautiful specimens are produced by cutting into the metal with a graver and other tools proper for engraving on steel, and afterward filling up the incisions with a pretty thick gold or silver wire. The cuttings should be made in a dovetail form, so that the wire which is inlaid may adhere the more strongly. An inferior style of damaskeening can be produced by the electrotype process. The pattern is etched on the steel, and gold or silver deposited in the etched lines.

Damasus, the name of two popes. I. SAINT DAMASUS I. was of the Hispanic race, born about 304, but from an early age he was employed as an inferior minister in the service of the Roman see. He was elected to the papacy 366; but as his election was displeasing to a strong faction in the city they set up a rival Pope, Ursinus. In a riot between the supporters of the two claimants of the papal chair in the Liberian Basilica, represented now by the Church of Santa Maria Maggiore, 137 persons, men and women, lost their lives; and Ammianus Marcellinus, the pagan historian, whose testimony is naturally hostile, declares that the ardor of the rivals to seize the episcopal seat surpassed the ordinary measure of human ambition. But ecclesiastical writers of the time make no mention of the 137 persons said to have lost their lives on this occasion, and its authenticity rests on the narrative of Ammianus alone. *Prætextatus*, the magistrate, who restored tranquility to the city, is said to have remarked to the successful Pope, "Make me bishop of the city of Rome and I will straightway be a Christian." Damasus was on terms of intimate friendship with St. Jerome, who was his secretary and counselor, and it was at his pressing instance that Jerome made a new revision and translation of the sacred Scriptures. In his pontificate the Emperor Valentinian I., 370, enacted a law designed to correct a grave abuse which had arisen in the Church—the custom of priests and monks receiving from wealthy penitents, especially women, gifts and legacies for themselves. Valentinian's law now made such gifts and bequests void; further it forbade ecclesiastics and monks to frequent the houses of widows and virgins under severe penalties. It is said that Pope Damasus himself

suggested this law to the emperor, as a means of correcting the abuse at which it was aimed. St. Jerome mournfully confesses the shame he himself felt that the law should have been necessary: "It shames me to say it," he writes, "but idolatrous priests, jockeys (*aurigæ*), and play-actors, and prostitutes come into inheritances; only to clerks and monks is it forbidden by this law. And the prohibition emanates not from persecutors but from Christian princes. Nor do I complain of the law; but I grieve because we have deserved this law." Damasus died 384. His feast is observed 11 December. 2. DAMASUS II. was born in Bavaria, and at an early age was ordained a priest. Later he was consecrated bishop and received the appointment to the diocese of Brixen in Tyrol. In 1047 he was elected Pope, but lived only 23 days after being raised to the pontificate.

Dam'bonite ($C_6H_6(NO_3)_6$), a white crystalline substance existing to the extent of 0.5 per cent in caoutchouc obtained from an unknown tree near the Gaboon, in Africa. It is extracted either by cautious sublimation, or by exhausting the dried juice with alcohol. It forms hexagonal crystals, without odor, but with a sweetish taste.

Dambul, dām-bool', **Dambool**, or **Dambulla**, a village in the island of Ceylon, at the junction of four lines of road, 70 miles north-east of Colombo. It takes its name from the rock Dambul, a large mass of gneiss and mica schist which rises 550 feet above the surrounding plain, and contains a number of caves, one of them with a long inscription relating to the government of Ceylon in the 12th century, and another with a colossal statue of Buddha hewn out of the rock. The priests of Buddha still officiate in these cave temples.

Dame (Lat. *domina*, mistress), a title of honor which long distinguished high-born ladies from the wives of citizens and of the commonalty in general, and which still is the legal title in Great Britain of a baronet's or a knight's wife. In consequence of the greater courtesy shown toward women of higher rank, arose the custom of prefixing the word *ma* to *dame*, as a special proof of veneration and homage. Hence, too, the virgin-mother was called in France *Notre Dame* (*our lady*, as if no single Christian could exclusively claim the privilege of serving her with the homage of his heart). The daughters of the king of France, as soon as they came into the world, were called *madame*; and this was also the sole title of the wife of the king's eldest brother. In England, the word *dame*, though not much used, is now applied to married women of all classes. It is also applied particularly to the mistress of a small elementary school, especially if elderly and ignorant. *Madame* is shortened into *madam*, a usual term of address for ladies in general, but still also a word of honor, applicable, in particular cases, to majesty itself.

Dame aux Camélias, La, lā dām ò kâ-mā-lē-ā (Fr. "The Lady of the Camellias"), a novel by Alexander Dumas the Younger, having for its heroine a certain real character, Margaret Gautier, belonging to the *demi-monde* of Paris. The novel appeared in 1848 and was published in dramatized form by Dumas in 1852. The English version of the play is known as 'Camille.'

Dameron, Charles Emile, shārl ā-mēl dāmē-rôn, French painter: b. Paris 1848. He

was a pupil of Pelouse; and has won several medals, one at the Centennial Exposition at Philadelphia, in 1876. His works include: 'Pyramids'; 'Oaks of Grand Moulin'; 'Woodman's Cabin in the Autumn'; 'Valley of the Mantega'; 'Approaching Storm.'

Dames of the Revolution, an American society organized in 1896, and composed of women above the age of 18 years, of good moral character, and of proved descent from ancestors who, either as military, naval, or marine officers, or officials in the service of any one of the 13 original colonies or States, assisted in establishing American independence during the War of the Revolution, or between 19 April 1775, when the hostilities began, and 19 April 1783, when they ceased.

Dame's Violet (*Hesperis matronalis*), the only American representative of the genus *Hesperis*, of the natural order *Cruciferae*, or mustard family. The genus belongs to Europe and Asia, and the American plants have escaped from cultivation. The pale purple sweet-scented flowers are found in fields and on roadsides in southern New England, westward to Kansas, and also in North Carolina. Other common names, mostly from England, where it is a very common flower, are: Queen's or dame's gillyflower; night-scented gillyflower; damask violet, etc. The flower is extremely cultivated, and garden varieties are found in all tints from purple to white.

Damiana, dā-mī-ā'nā, a drug derived from the leaves of South America, Mexican and Central American species of *Turnera*, especially *Turnera diffusa*. The botanical relationships of the various species are not well known. The chemical components consist of volatile oil, resin, and bitter principles, and the drug, therefore, acts as the aromatic bitters. It is widely used in many disreputable quack remedies that are practically worthless.

Damiani, dā-mē-ā'nē, or **Damianus**, Petrus, Saint, one of the fathers of the Church: b. Ravenna 1007; d. Fuenza 23 Feb. 1072. In infancy he was abandoned by his mother and then treated inhumanly by one of his brothers who gave him shelter, but another brother, Damianus, undertook his guardianship and gave him a good education. In gratitude, Petrus assumed the name Petrus Damiani, Damianus' Peter. For some years he conducted schools in Ravenna, but at the age of 30 joined a community of hermits and 1041 was elected to be their abbot. The renown of his piety, sanctity, and wisdom having spread widely, brought to his cell people high and low to entreat his prayers or his counsel, and popes and emperors did not disdain to solicit his advice. Made cardinal and bishop of Ostia, 1057, he prevailed on Benedict X., irregularly elected by the dominant faction of the Roman nobility, to resign 1058, and 1062 he induced the anti-Pope Honorius II. to forego his claims to the Roman see. He was an intensely zealous advocate of the reform of the Church and correction of the flagrant abuses which were widespread among the clergy in his time. In his manifesto, well styled by him 'Liber Gomorrhinus' (Book of Gomorrah), he exposes without regard to the dignities held by the offenders, the vices and the unspeakable enormities by which they brought discredit on the Christian profession. Had not the interests of religion de-

DAMIANISTS — DAMOCLES

manded it, such outspokenness would have been inexcusable and an offense against public morality. Another of his works bears the title, 'De Correctione Episcopi et Papæ' (of correcting a bishop and a Pope). All his life he practised the utmost austerities of the hermit. By decree of Pope Leo XII. his name was added to the roll of Doctors of the Church, and 23 February was appointed as his feast-day.

Da'mianists, or Angelists, disciples of Damian, the monophysite patriarch of Alexandria, in the 6th century. They professed a belief in only one nature in Christ. The Council of Chalcedon, in the 5th century, had condemned the heresy held by the Damianists in the 6th century.

Damien, dā-mē-ān, **Father** (JOSEPH DAMIEN DE VEUSTER), a Belgian priest: b. Louvain 3 Jan. 1840; d. Molokai 10 Aug. 1889. At an early age he decided to become a priest, and in time he found work in his chosen mission field in Honolulu. Here he heard from the bishop the neglected state of the lepers, some 700 or 800 in number, who lived on the small island of Molokai, and he volunteered to live and work among them. From 1877 onward he became physician of their souls and bodies, their magistrate, teacher, carpenter, gardener, cook, and even gravedigger at need. For a long time he worked on single-handed at his noble labors, but was finally joined by another priest. For 12 years he escaped all contagion of the fatal disease, though in constant contact with the sick and dying; but in 1885 the malady appeared in him. He continued unabated his heroic labors till very near his death. Consult: C. W. Stoddard, 'South Sea Idyls'; 'Lepers of Molokai.'

Damiens, Robert François, rō-bār frān-swā dā-mē-ān, French fanatic: b. Tieuloy, Artois, 1715; d. Paris 28 March 1757. He enlisted as a soldier, and was afterward a servant in the college of the Jesuits at Paris, but in 1738 left this service in order to marry. He then served in different houses of the capital, robbed one of his masters, a Russian, and saved himself by flight. His mind was disordered when he returned to Paris at the end of 1756. In the beginning of the next year he went to Versailles, took opium for two or three days, and prepared for the crime which he attempted 5 January. As Louis XV. was on the point of getting into his carriage Damiens stabbed him in the right side. The wound was of a trifling nature. Damiens did not attempt to escape. When questioned he said he never intended to kill the king, which he might easily have done. The most cruel tortures he bore with resolution, and could not be induced to confess that he had any accomplices. He asserted that he should not have committed the act had he been bled, as he requested, and that he thought it meritorious. He was condemned to be torn in quarters by horses, and the sentence was executed on the Place de Grève at Paris.

Damietta, dām-ī-ēt'tā, Egypt, town in Lower Egypt, on one of the principal branches of the Nile, 100 miles north-northeast of Cairo; lat. 31° 25' N.; lon. 31° 5' E. It is irregularly built, and contains some fine mosques, bazaars, and marble baths. Damietta was at one time a very important place, and carried on an extensive foreign trade, but is now eclipsed by Alexandria. A bar at the mouth of the Nile prevents large ves-

sels from reaching the town, compelling them to anchor outside, and to load and unload by means of small craft of from 30 to 60 tons burden. A military school and cotton-factory were established here by Mehemet Ali. The ancient town of Damietta (*Tamiāthis*) stood about five miles nearer the sea, or farther north. The danger to which it was exposed, however, from its position on the shores, induced the Egyptian caliphs to change its position, and to remove it to where the modern town now stands about the year 1251. The present town contains many antique columns and blocks, supposed to have been brought from the old city. It is the terminus of a railway from Cairo. Pop. 31,288.

Dammar, dām'mar, a resin derived from various plants, principally *Agathis dammara* and *A. australis*, both members of the pine family. These are natives of Molucca and the East India Islands, also of the Philippines and New Zealand. Dammar is exuded from the main stems and also from the roots of the plants. In some regions, notably in the mountains of Sumatra, the resin bursts forth in profusion from spontaneous fissures. In other regions artificial incisions are made in the trees, with a yield of resin correspondingly greater. Dammar comes into the market in large masses, or small pieces. It is yellowish, transparent when in small pieces, smooth and brittle, breaking with a clean, glassy fracture and it is readily reduced to powder. It is intermediate in hardness between colophonium and copal. Chemically it contains traces of ethereal oil, dammarolic acid and two resins. It is widely used in pharmacy and in the manufacture of varnishes.

The same name is applied in commerce to the resin of other and unrelated trees. Thus the dammar of shipyards is obtained from a species of *Canarium*, an amyridaceous tree, while black dammar is a kind of pitch derived from the allied *Marignia*. *Shorea robusta*, a dipteraceous tree, yields pitch and resin used in Indian dockyards, and sometimes also called dammar. Dammar is also occasionally confused with kinds of copal; thus, the resin of *Vateria indica* (*Dipteraceæ*) is sometimes known as dammar or piny dammar, of which the piny varnish of India is compounded. One of the Australian species, *A. robusta*, has been grown in some parts of California with fair success.

Dammara. A genus of coniferous trees now known as *Agathis*. See KAURI PINE.

Dammood', a river in British India, which rises in the district of Ramghur and flows through Bengal, east, southeast, and south a distance of 350 miles. Rich deposits of coal and iron are found in its valley.

Dam'ocles, a native of Syracuse, and one of the courtiers and flatterers of the tyrant Dionysius the Elder. His name has become proverbial in consequence of a well-known anecdote related of him as illustrative of the uncertainty of human greatness and felicity. He had been extolling the grandeur and happiness of Dionysius, whereupon the latter invited him to a magnificent banquet, where he would be regaled with regal fare and royal honors. In the midst of the entertainment, however, Damocles happened to look upward, and perceived a naked sword suspended over his head by a single hair. The sight of this filled him with dismay, and

taught him at what a sacrifice of mental peace and personal security the enjoyments and splendors of royalty may be purchased.

Dámodar, dā-mō'dār, a river of Bengal, in India, which after a southeast course, flows into the Hugli, just above the James and Mary Sands and below Calcutta. A little below the mouth of its chief tributary, the Barákhhar, which it receives from the north, the Dámodar becomes navigable. The valleys of these two streams contain the coal-fields which produce about four fifths of the whole amount of coal mined in British India. Length about 350 miles.

Da'mon and Phin'tias (not PYTHIAS), two illustrious Syracusans, celebrated as models of constant friendship. Phintias had been unjustly condemned to death by Dionysius the Younger, tyrant of Sicily, but obtained permission to arrange his affairs in a neighboring place on condition that his friend should remain as a pledge of his return. Damon surrendered himself at the prison, ready to suffer death instead of Phintias if he did not return at a fixed time. Unexpected impediments detained him. Damon, still fully convinced of the faithfulness of his friend, was on the way to the place of execution, and the people began to murmur and to pity his credulity, when Phintias suddenly rushed through the crowd into the arms of his friend. While they demand each to die for the other, Dionysius himself approaches, pardons them, and entreats them to admit him a third in their friendship. Schiller has described this adventure in an excellent ballad, 'Die Burgschaft,' and it is the subject of a popular English tragedy.

Damper, a plate in an air-draft or flue, for the purpose of controlling the fire by regulating the area of the passage for the ingress or egress of air as the case may be. Dampers are of various forms. They are to the air-pipe or flue what the valve or faucet is to the duct for steam or liquids. The dampers of furnaces are either in the door of the ash-pit, to regulate the ingress of air, or in the course of or on top of the chimney, to close the egress of the volatile results of combustion. In the latter form they are used in almost all metallurgic furnaces.

In locomotive engines, a kind of iron venetian-blind, fixed to the smoke-box end of the boiler in front of the tubes; it is shut down when the engine is standing, and thus stops the draught and economizes fuel, but it is opened when the engine is running.

In pianofortes, certain movable parts, which are so arranged as to press upon the wires and check their vibration whenever the finger leaves the keyboard. Perfect damping is difficult to obtain, but when efficient it enhances brilliancy of execution and distinctness of harmony in a composition.

Dampier, dām'pēr, William, English navigator: b. East Coker, Somerset, June 1652; d. London March 1715. In 1673 he served in the Dutch war, and subsequently engaged in a band of privateers, as they called themselves, although in reality pirates, with whom he roved on the Peruvian coasts. Dampier, wishing to obtain some knowledge of the northern coast of Mexico, joined the crew of a Capt. Swan, who cruised in the hopes of meeting the annual royal Manila ship, which, however, escaped them. Swan and Dampier were resolved to steer for the East Indies, and they accordingly crossed

the Pacific, and after various adventures Dampier and others were left ashore on Nicobar Island. After making several trading voyages in the Eastern seas he entered as a gunner in the fort at Bencoolen. Upon this coast he remained until 1691, when he found means to return home. In 1697 he published an account of his voyage round the world, which had a great success, and was supplemented by a second volume in 1699. He now obtained command of a ship in the king's service fitted out for a voyage of discovery. In this he made important explorations on the coasts of Australia and New Guinea. Dampier's writings include: 'A Voyage Round the World' (1697); 'A Discourse of Winds' (1699); 'Vindication of the Voyage to the South Sea' (1707); 'Voyages to the Bay of Campeachy' (1729). They bear all the marks of fidelity; and the nautical remarks display much professional and even philosophical knowledge. His observations on natural objects are also extremely clear and particular.

Dampier, the name of several places in Australasia: (1) Dampier Archipelago, a cluster of about 20 small rocky islands off the north-west coast of Australia, in lat. 21° S., and lon. 117° E., divided by the Mermaid Strait in two groups; in the east is Rosemary, the largest island. (2) Dampier Island, off the northeast coast of New Guinea, with a volcano about 5,250 feet high. (3) Dampier's Land, a peninsula of western Australia, fertile and well watered, lying between King Sound and the Indian Ocean. (4) Dampier Strait, between New Guinea and the archipelago of New Britain, forming, with Goschen Strait to the southeast, the shortest route from eastern Australia to China by some 300 miles. (5) Dampier Strait, separating the island of Waigiu from the north-west extremity of New Guinea, the safest and easiest passage between the Indian and Pacific oceans.

Damping-off, the rotting of seedlings and cuttings in the seed-bed and the cutting bench, usually just above the surface of the soil. The immediate cause is a soil fungus (*Artotragus* or *Pythium debaryanum*) which feeds upon decaying organic matter until it obtains a favorable opportunity for attacking a living host. This opportunity is generally afforded by a weakened condition of the seedlings or cuttings due to a more or less stagnated atmosphere highly charged with moisture and of rather high temperature. The fungus gains entrance to the weakened stems which soon turn brown or black. The foliage quickly becomes infested and sometimes in a single night a whole seed-bed or bench full of cuttings may become a rotting mass with no healthy plants left. With careful management the trouble can be avoided. The propagating medium should be clean, sharp sand, which should be thoroughly drenched when the bed is watered, the excess water passing quickly away in perfect drainage. The bed should never be allowed to become dry. In short, both seedlings and cuttings should be kept growing steadily and sturdily. The drenching washes the spores of the fungus down through the sand. Should a bed become infested the healthy plants should at once be transferred singly and with as little soil as possible to fresh quarters. Neither freezing nor drying

DAMPS — DAN

the soil will kill the fungus, which can live for months when growth is impossible. Sterilizing the sand or soil with steam is sometimes resorted to, the sand being heated for several hours. Less frequently plants in the open air are attacked. In the greenhouse and nursery experience in management will count for much.

Damps, certain deleterious gases which are released in mines. They are distinguished by miners under the names of choke-damp and fire-damp. The former is found in the deepest parts of mines. It extinguishes candles, and often proves fatal to human life. It consists for the most part of carbonic acid gas. The fire-damp, which prevails almost exclusively in coal-mines, is a mixture of light carburetted hydrogen and atmospheric air, and explodes violently whenever it comes in contact with flame. The gas or after-damp which remains in a mine after an explosion is a kind of choke-damp, and consists of a mixture of carbonic acid gas—produced by the combustion of the carburetted hydrogen—and the nitrogen of the air. It is of course fatal. The accidents which formerly occurred so frequently both to the machinery and to miners, arising from the fire-damp, are, if due precaution is used, obviated by Sir Humphry Davy's safety-lamp. This lamp consists of a cylinder of wire gauze, about four inches in diameter and one foot in length, having a double top, securely fastened by doubling over to a brass rim, which screws on to the lamp itself below. The whole of the wire gauze is protected and rendered convenient for carrying by a triangular wire frame and a ring at the top. The wire gauze is made either of iron or copper, the wire being at least one thirtieth of an inch in diameter, and woven together so as to leave 625 apertures in a square inch. The body of the lamp is of rivetted copper, or of massy cast brass or cast iron, the screws fitting so completely as to leave no aperture into the body of the lamp. When the lamp is lighted, it affords the miner all the light which he requires, and renders him perfectly secure, even though entirely enveloped with the gaseous mixture which, with an ordinary light, would immediately explode. The first effect of the fire-damp atmosphere is to increase the length and size of the flame. When the carburetted hydrogen forms as much as one twelfth of the volume of the air, the gauze cylinder becomes filled with a feeble blue flame, but the flame of the wick appears burning brightly within the blue flame, and the light of the wick expands until the inflammable gas increases to one sixth or one fifth, when it is lost in the flame of the fire-damp, which now fills the cylinder with a pretty strong light. As long as this explosive mixture of gas exists in contact with the lamp, so long it will give light; and when it is extinguished, which happens when the foul air constitutes as much as one third of the volume of the atmosphere, the air is no longer fit for respiration; for though animal life will continue when flame is extinguished, yet it is always with suffering. A coil of platinum wire being fixed above the wick of the lamp, within the gauze cylinder, the metal continues to glow long after the lamp is extinguished, and affords a sufficient light to enable the miner to make his escape. The effect of the safety-lamp is supposed to depend on the cooling agency of the wire gauze, exerted on the portion of gas burning within the cylinder. Hence a lamp may

be secure where there is no current of an explosive mixture to occasion its being strongly heated, and yet not safe when the current passes through it with great rapidity. But any atmosphere, however explosive, may be rendered harmless by increasing the cooling surface, which may be done either by diminishing the size of the apertures, or by increasing their depth, both of which are perfectly within the power of the manufacturer of the wire gauze.

Damrosch, dām'rōsh, **Frank**, American musician: b. Breslau, Prussia, 22 June 1859. He was trained by his father, Leopold (q.v.), and in 1882 became conductor of the Denver Chorus Club and supervisor of music in the public schools of that city. He was chorus master at the Metropolitan Opera House, New York, from 1885 to 1891, and in 1892 organized the People's Singing Class. Since 1897 he has been supervisor of music in the public schools of New York.

Damrosch, Leopold, German musician: b. Posen, Prussia, 22 Oct. 1832; d. New York 15 Feb. 1885. He was graduated from the University of Berlin, and began the practice of medicine; but his love for music predominated, and in 1864 he gave up his medical profession and started on a tour as violinist. He met with great success and on his return to Posen was appointed musical director at the Stadt Theater. He subsequently held a similar post in Breslau. Coming to the United States, he was made leader of the Arion Society in New York, and subsequently founded the Oratorio and Symphony societies of that city.

Damrosch, Walter Johannes, American musician: b. Breslau, Prussia, 30 Jan. 1862. He is a son of Leopold Damrosch (q.v.), and has been a citizen of the United States since 1871. He inherited the musical talent of his father, and succeeded him in his enterprises. He is the special exponent of the Wagnerian school of music, and has conducted operatic performances in all the large cities, proving himself a most acceptable leader. He has also written an opera founded on Hawthorne's tale of 'The Scarlet Letter,' besides other excellent music.

Dams. See RESERVOIRS.

Damsel-fly, sometimes, though rarely, used as a popular name for the common dragon-fly, or mosquito-hawk, of the neuropterous family *Libellulide*. Damsel-fly is the English equivalent for the French *demoiselle* (fly) which is applied only to the genus *Agria*. This is a very small dragon-fly, not half as large as *Libellula*. Its metallic greenish-blue color and slender delicate form produce a beautiful effect in the sunshine, and suggest the name. See DRAGON-FLY.

Damson, a variety of plum (q.v.).

Dan (Heb. "judgment"), one of the sons of Jacob by his concubine Bilhah. Like the other sons of Jacob, Dan became head of one of the 12 tribes of Israel. At the time of the exodus the Danites numbered 62,700 adult males. The territory assigned them in Canaan lay on the coast, but living in the immediate neighborhood of the hardy and well-equipped Philistines—for the district lay partly within the Philistine territory—the available land proved somewhat too narrow for the Danites, and they were pushed back into the more mountainous region,

CHARLES A. DANA.

DAN RIVER—DANA

where they encroached on the boundaries of Judah. The tribe also possessed an isolated portion of territory in the extreme north of Canaan, containing the town of Laish or Dan, which gave rise to the proverbial expression "from Dan to Beersheba." This town was in later times selected by Jeroboam as one of the two centres of his idolatrous worship, but a species of idolatry had been maintained there from the earliest times of the settlement in connection with the image of Micah. The most notable person connected with the tribe was Samson.

Dan River, a river rising in Patrick County, Virginia, flows across the boundary between Virginia and North Carolina a number of times, but finally unites with the Staunton River, at Clarksville, Va., and forms the Roanoke. The river is somewhat less than 200 miles in length, and furnishes valuable water power in its upper part. It is navigable for about 100 miles above the junction with the Staunton River.

Dana, Charles Anderson, American journalist: b. Hinsdale, N. H., 8 Aug. 1819; d. Glen Cove, L. I., 17 Oct. 1897. He was educated at Harvard and in 1842 was a member of the Brook Farm Community, in Roxbury, Mass., remaining there only two years. He edited 'The Harbinger' (1844-7), his associates being George Ripley, Parke Godwin, and John S. Dwight. In 1847 he became managing editor of the *New York Tribune*, with which he remained until 1861. In 1855, with George Ripley, he projected and edited Appleton's 'American Encyclopædia' in 16 volumes, completed in 1863, and revised in 1873-7. He also edited several other works, among them the popular 'Household Book of Poetry' (1857). From 1862 to 1865 he was in the service of the United States government, during the last two years as assistant secretary of war under President Lincoln. About the beginning of 1866 he became editor of the *Chicago Republican*, a daily paper. In 1868 he purchased an interest in the *New York Sun*, also a daily, of which he was editor and chief proprietor until his death. He was a man of forcible character and impressed his personality upon his paper. His literary judgments and perceptions were keen and his own writing exhibited a perfect mastery of English style. Under his management the *Sun* became noted for the literary quality of its editorials. In his later years, however, his intense political partisanship became very marked and greatly diminished the weight of his influence in journalism.

Dana, Charles Loomis, American physician: b. Woodstock, Vt., 25 March 1852. He was graduated from Dartmouth College in 1872, studied medicine and has been professor of nervous diseases in Dartmouth Medical College, and at the medical department of Cornell University. He has published 'Text Book of Nervous Diseases' (1892).

Dana, Edward Salisbury, American mineralogist: b. New Haven, Conn., 16 Nov. 1849. He was graduated from Yale in 1870 and has been a member of the faculty at that institution from 1874, at present (1903) as professor of physics. He has published: 'A Text Book of Mineralogy' (1877); 'Text Book of Mechanics' (1881); 'Minerals, and How to Study

Them'; 'Sixth Edition of James D. Dana's System of Mineralogy' (1892).

Dana, Francis, American jurist: b. Charlestown, Mass., 13 June 1743; d. 25 April 1811. He was a son of Richard Dana (q.v.), was graduated at Harvard in 1762, and admitted to the bar in 1767. In 1775 he was sent to Europe on a confidential mission to Benjamin Franklin, carrying letters from Warren, Quincy, and other patriots. He returned the next year and reported to Gen. Washington that the colonies need expect nothing of Great Britain. In 1777 he was elected a member of the Congress that formed the Confederation, and filled various offices during the Revolutionary War. In 1781 he was made minister to Russia, and after his return was again elected to Congress. In November 1791 he was appointed chief-justice of Massachusetts for a term of 15 years.

Dana, Francis, American lawyer and author: b. Singapore, East India, 4 March 1866. He was educated at Saint Paul's School, Concord, N. H., and the Harvard Law School, and besides contributing short stories to periodicals has published 'Lenora of the Yawmish.'

Dana, James Dwight, American naturalist: b. Utica, N. Y., 12 Feb. 1813; d. New Haven, Conn., 14 April 1895. He was graduated at Yale College in 1833; accompanied the American expedition of 1838 to the Southern and Pacific oceans as geologist and mineralogist, and on his return compiled exhaustive reports. In 1835 he became Silliman professor of natural history and geology at Yale, but in 1864 the title was altered to that of professor of geology and mineralogy. Many American and foreign learned bodies conferred distinctions on him. Besides many articles in various journals, he wrote: 'System of Mineralogy' (1837); 'Manual of Mineralogy' (1848); 'Coral Reefs and Islands' (1853); 'Manual of Geology' (1863); 'Text-Book of Geology' (1864); and 'The Geological Story Briefly Told' (1875).

Dana, John Cotton, American librarian: b. Woodstock, Vt., 19 Aug. 1856. He was graduated at Dartmouth College 1878, and admitted to New York bar 1882. He was librarian of the Public Library, Denver, Col., 1889-97; of the City Library Association of Springfield, Mass., 1898-1901, and has since been at the head of the Public Library of Newark, N. J.

Dana, Marvin, American writer: b. Cornwall, Vt., 2 March 1867. He has published: 'Mater Christi and Other Poems'; 'History of Gen. Custer'; 'History of the Mormons'; 'Wars of the Century'; 'Studies in Criminology'; 'A Brief Universal History.'

Dana, Napoleon Jackson Tecumseh, American soldier: b. Eastport, Me., 15 April 1822. He was graduated from West Point in 1842, served in the Mexican war and in the Civil War also, becoming major-general. He resigned from the army in 1865 and has since engaged in mining enterprises, and been president of several railroads.

Dana, Paul, American journalist: b. New York 20 Aug. 1852. He is a son of C. A. Dana (q.v.), and was educated at Harvard and the Columbia Law School. He began journalism on his father's paper, the *New York Sun*, and after the latter's death in 1897, was for several years its editor-in-chief.

Dana, Richard, American jurist: b. Cambridge, Mass., 7 July 1699; d. 17 May 1772. He was a grandson of Richard Dana, the first of the family who came from England and settled at Cambridge in 1640. After practising law at Marblehead and Charlestown, he removed to Boston, where he became a leading barrister. He was distinguished for his prominence in the measures of resistance which immediately preceded the American Revolution. Although devoted to his profession and declining office, he was a leading figure in those important political assemblages, where he sometimes presided, the Boston town meetings from 1763 to 1772. It was the custom of Boston in those troubled times to address the country at large on public affairs under the form of published instructions to the representatives of the town. Warren, Hancock, and the Adamses were on committees for this purpose. Dana was always a member, and often at their head. He reported the papers of 20 Nov. 1767, and 8 May 1770, noted at that time. He was a member of the association of the Sons of Liberty, and at their celebrated meeting of 17 Dec. 1769, administered to Secretary Oliver the oath of non-execution of the Stamp Act, and made and signed a solemn official record of that fact, by which he would seem to have exposed himself to the charge of treason under the constructions of those days.

Dana, Richard Henry, the Elder, American poet and essayist: b. Cambridge, Mass., 15 Nov. 1787; d. Boston 2 Feb. 1879. He was a son of Francis Dana (1743-1811 q.v.); studied at Harvard College and was admitted to the Massachusetts bar in 1811. He was connected with the 'North American Review' from its commencement in 1815, and his earliest writings first appeared in that periodical, of which he became joint-editor in 1818. His lectures on Shakespeare's characters, delivered in the principal cities of the Atlantic coast (1839-40), awakened a deep public interest. His principal poems are: 'The Change of Home' (1824); 'The Dying Raven' (1825); 'The Buccaneers' (1827), specially noteworthy for its descriptions of the vicissitudes of ocean scenery. To a periodical publication, 'The Idle Man' (N. Y. 1821-2), of which he was editor, he contributed critical papers and several stories; among them 'Paul Fenton' and 'Edward and Mary.'

Dana, Richard Henry, American jurist and miscellaneous writer: b. Cambridge, Mass., 1 Aug. 1815; d. Rome, Italy, 7 Jan. 1882. He was a son of the preceding. He entered Harvard College in 1832, but compelled on account of an affection of the eyes to suspend his studies in 1834, he undertook a voyage to California in the capacity of a common sailor. This voyage he described in a very interesting book, 'Two Years Before the Mast' (1840, enlarged edition 1869). Returning to college he completed his law course, and was admitted to the Boston bar in 1840, soon securing a large number of admiralty cases. In 1841 he published a treatise on seamanship, 'The Seaman's Friend' (republished in England as 'The Seaman's Manual'), containing a treatise on practical seamanship, a useful dictionary of sea terms, and valuable information on maritime law. In 1859-60 he made a voyage round the world, visiting the Sandwich Islands, China, Japan, Ceylon, India, and Egypt, returning

through Europe. In 1861 he was appointed United States attorney for Massachusetts, and was counsel for the United States in the proceedings against Jefferson Davis for treason, in 1867-8. In 1866 he published a copiously annotated edition of Wheaton's 'Elements of International Law.' See Adams, 'Richard Henry Dana: a Biography' (1890).

Dana, Samuel Luther, American chemist: b. Amherst, N. H., 11 July 1795; d. Lowell, Mass., 11 March 1868. For more than a generation he was employed as chemist in the Merrimac Print Works in Lowell, and while there invented a new method of bleaching cotton goods which was very widely adopted.

Dana, William Parsons, American marine artist: b. Boston, Mass., 18 Feb. 1833. He studied in Paris under Picot and Le Poitevin, became a member of the National Academy in 1863 and obtained a third class medal at the Paris Exhibition of 1878 for his 'Gathering Seaweed.' One of his most noted pictures is the 'Chase of the Frigate Constitution,' now on exhibition in a private art gallery in New York city.

Dana, Mrs. William Starr. See PARSONS, FRANCES THEODORA STARR.

Danaë, dā'nā-ē, in Greek mythology, daughter of Acrisius, king of Argos. She was shut up by her father in a brazen tower, because an oracle had declared that a son of his daughter should put him to death. But Zeus, inflamed with passion for the charming virgin, transformed himself into a golden shower, and descended through the apertures of the roof into her embraces. When Acrisius discovered that his daughter had become a mother he exposed her with her child, in a chest, to the violence of the waves. But the sea-goddesses, anxious for the preservation of the son of Jove, commanded the billows to bear the box safely to Seriphos, one of the Cyclades. Polydectes, or rather Dictys, the governor of the island, received her, and educated the child, which he named Perseus.

Danaï. See DANAUS.

Danaïs, dā'nā-īs, a genus belonging to the group *Nymphalidae* (by some placed in *Papilionidae*), the largest family of day-flying lepidopterous insects, widely scattered over the globe. *D. erippus* (or *archippus*) is prevalent in all parts of the United States. Its wings are variegated with yellow, black, and white bands, and it occurs frequently in summer along country roads, in pastures, and wherever the milkweed, its favorite food, grows. The chrysalis is well known for its beauty of green and gold. The caterpillar is marked with yellow and black bands. *Danaïs* is a famous globe-traveler, having spread by some unknown means from continents to islands of the ocean, and to Australia. Very beautiful species abound in India. In New Holland it was found that the natives, who called it "bugong moth," valued it highly for food. By means of smothered fires they were able to suffocate and collect the "moths" in large quantities, after which the appendages were removed and the bodies were made into oily cakes.

Danakil, dā-nā-kēl' (singular DANKALI), the Arabic and now general name for the numerous nomad and fisher tribes inhabiting the coast of northeast Africa, from Massowah south to

DANAO — DANCE OF DEATH

Tajurrah Bay, and from there southwest to Shoa. They belong to the Ethiopic Hamites, and are well built and slender, with features indicating an intermixture of Arab blood. In a country of waterless plains, they are generally nomads, living partly by caravan traffic and the slave trade, but mostly on the milk of their flocks.

Danao, Philippines, (1) town on the east coast of the island of Cebú, four miles north of Compostela, and 18 miles north of the town of Cebú. The productions of the interior are important for exports, but the anchorage at Danao is not good enough to encourage steamers to load at this port. The road along the coast is in a good condition. Pop. 15,483. (2) Danao, a hamlet, is on the west coast of South Antique, Panay, four miles north of Dao. (3) A lake in West Leyte, south of Panangua crater. (4) A mountain peak on the island of Luzon. (5) A river in the northeast of Negros Occidental, rising in the crater of Solitario, flows east into a small bay, on the north shore of which is situated Escalante.

Dan'aus, in Greek mythology, the son of Belus and twin-brother of Ægyptus, originally ruler of Libya. Fearing his brother, he fled to Argos, with his 50 daughters, the Danaïdes, and here he was chosen king, in place of Gelanor. The 50 sons of Ægyptus followed him, and under the pretence of friendship, sought the hands of his daughters in marriage. Danaus consented, but on the bridal night he gave his daughters each a dagger, and urged them to murder their bridegrooms in revenge for the treatment he had received from Ægyptus. All did so, except one, Hypermnestra, who allowed her husband, Lynceus, to escape. The fable states that in the under-world the Danaïdes were compelled, as a punishment for their crimes, to pour water for ever into a vessel full of holes. From Danaus, the Argives were called Danai.

Dan'bury, Conn., city and one of the county-seats of Fairfield County; on the New England, and the New York, New Haven & Hartford railroads; 62 miles northeast of New York. It is the greatest hat-making city in the United States, with nearly 30 factories in operation. It has also extensive manufactures of iron, brass, and silverplated ware, bicycles, paper, and foundry and machine shop products. There are a court-house, public library, high school, public parks, electric street railways and lights, soldiers' monument, two national banks, daily and weekly newspapers, and excellent public and private schools. A temporary settlement was made here in 1684, a meeting-house was erected in 1696, and for many years the place was known by the Indian name of Paliquioque. In 1776 the place was made a depository for army stores, and when Gen. Tryon, the British governor of New York, was informed of the fact he headed a force of over 2,000 men, landed at Norwalk, marched immediately upon Danbury, and set fire to the town and stores. Hat-making was begun here in 1780. Pop. (1900) 16,537.

Danby, Francis, Irish painter: b. Wexford, Ireland, 16 Nov. 1793; d. Exmouth, Devonshire, England, 17 Feb. 1861. He studied at the Dublin Academy of Fine Arts, and sent to its exhibition his first picture in 1812. In 1820 he settled at Bristol, established his reputation in 1823 by his 'Sunset at Sea After a Storm'; and

in 1825, by his 'Delivery of Israel out of Egypt,' obtained the honor of being admitted as an associate of the Academy. Among his subsequent pictures the most celebrated are the 'Opening of the Sixth Seal' (1828); the 'Age of Gold' (1831); 'The Enchanted Island—Sunset' (1841); 'The Contest of the Lyre and Pipe in the Vale of Tempe' (1842); and the 'Painter's Holiday' (1844). Danby's excellence lay in his delineations of scenery, and the poetic halo with which he contrived to invest them.

Danby, Thomas Osborne, DUKE OF LEEDS; English statesman: b. 1631; d. 26 July 1712. A favorite of Charles II., he became lord treasurer in 1673 and was made Earl of Danby the next year. He was instrumental in bringing about the marriage of the Duke of York's daughter, Mary, to the Prince of Orange, and on the accession of William III. was appointed president of the council, and in 1694 was created Duke of Leeds.

Dance of Death, a grotesque allegorical representation in which the figure of Death under various forms takes the lead, followed by dancers of all ages and conditions. It was frequently drawn by artists of the Middle Ages for cemeteries and cloisters. These representations were common in Germany, and also in France, where they received the name of *Danse Macabre*. This term is supposed by some to be derived from the Arabic *magbarah*, a cemetery, but much more probably from the *Chorea Machabæorum*, or dance of the Maccabees, a kind of dramatic representation performed in the Middle Ages, in which the seven martyred brothers mentioned in the second book of Maccabees (Apocrypha) would appear to have been introduced. A Dance of Death was painted on the walls of the churchyard of the Innocents at Paris, about the middle of the 15th century, which the chapter of St. Paul's in London caused to be copied, to adorn the walls of its monastery. Gabriel Peignot, in the 'Recherches sur les Danses des Morts et sur l'Origine des Cartes à jouer' (Dijon and Paris 1826), investigated the origin of the Dance of Death in France, and explained the dancing positions of the skeletons, by the fact which old chronicles relate, that those who were attacked by the plague ran from their houses, making violent efforts to restore their rapidly declining strength by all kinds of morbid movements. The most remarkable Dance of Death was painted, in fresco, on the walls of the churchyard in the suburb of St. John at Basel, which was injured, in early times, by being washed over, and is now entirely destroyed. This piece has been ascribed to the celebrated Hans Holbein; but it has long since been proved that it existed 60 years before his birth. It was painted at Basel in the year 1431, by an unknown artist, in commemoration of the plague, which prevailed there at that time. It represented Death as summoning to the dance persons of all ranks, from the Pope and the emperor down to the beggar, and was explained by edifying rhymes. That piece contained about 60 figures as large as life. Besides being ascribed to Holbein, as was before stated, it has also been ascribed to a painter named Glauber, but without foundation. Holbein perhaps conceived, from this picture, the idea of his Dance of Death, the original drawings of which are at St. Petersburg. Very fine

DANCE—DANCING

engravings of these are in the 'Œuvres de Jean Holbein, par Chrét. de Méchel' (Vol I, Basel 1780).

Dance, St. Vitus. See CHOREA.

Dancing, a form of exercise or amusement in which one or more persons make a series of graceful movements in measured steps in accord with music. Aristotle ranked dancing with poetry, and Pindar applies the name of "The Dancer" even to Apollo. Dancing corresponds to a universal primitive instinct in man, and is practised by the South Sea Islanders, the Forest Indians of Brazil, the Zulus, the negroes of central Africa, and the native Australians, exactly as it was in the earlier stages of every civilized modern race. Ferocious war-dances were practised by savage warriors, as the North American Indian braves, who brought on a frantic mechanical intoxication capable of carrying them to victory. The Zulu war-dance is a noble exercise for warriors, like the Pyrrhic dance of the ancient Spartans; and the dancing and spinning dervishes in the East, who work themselves into spasms of physical excitement, are still highly esteemed for devoutness and piety. The idea of magic always enters into savage dancing. Thus, the Mandan Indians dance the buffalo-dance to bring game when supplies of food are low. The rain doctors of central Africa dance mystic dances to bring rain; and the wives of the Gold Coast negroes dance a battle-dance to give their absent husbands courage in battle.

The art of dancing dates back to the early Egyptians, who ascribe that invention to their god, Thoth. Among the ancient Jews, Miriam danced to a sound of trumpets, itself an act of worship, and David danced in procession before the Ark of God. Religious processions went with song and dance to the temples; the Cretan chorus moving in measured pace sang hymns to the Greek god, Apollo, and one of the Muses (Terpsichore) was the special patroness of the art. The Phrygian Corybantes danced in honor of Cybele, and the festivals of Rhea Silvia at Rome were also accompanied with wild dances, while during the early festival of Mars the Salian priests sang and danced, beating their shields. The Spartans practised dancing as a gymnastic exercise and made it compulsory on all children from the age of five. The Romans in general considered it disgraceful for a free citizen to dance except in connection with religious rites, but willingly witnessed the performances of professional dancers like the Almé of modern Egypt, and the Bayadères, or Nautch girls, of India. The early Christians practised choral dances, which came into discredit with the love-feasts or Agapæ. A survival of religious dancing is still seen even within the pale of Christendom, where during the Corpus Christi octave a ballet is danced every evening by boys from 12 to 17 years of age, wearing plumed hats and in the dress of pages of Philip III.'s time.

The Puritan ancestors saw deadly sin in promiscuous dancing. Father Mariana tells us that the famous saraband worked more mischief than the plague. The fandango was hotly condemned by the clergy, but when danced before the Sacred College, who wished to see it before prohibiting it, so charmed the judges that they gave it their unanimous approval. Many of the

medieval dances were solemn and stately in character like the *danses basses*, which were danced to psalm tunes at the court of Charles IX. of France. It is said that the whole august Council of Trent danced at a ball given in 1562 to King Philip II. of Spain. The *Galliarde* and *volta* were introduced into France from Italy by Catharine de Medici. Dancing reached its height during the reign of Louis XIV., who was himself an enthusiastic dancer in the court ballets.

The minuet was a favorite in France for a century; and then came the quadrille or *contre-danse*, often connected erroneously with the English country-dance; the *Rossaise* was first introduced in 1760; the galop was introduced from Germany; the cotillon was fashionable under Charles X.; polka was first danced at the Odéon in 1840 by a dancing master from Prague; the polka tremblante or schottisch, was of Bohemian origin and was first brought out in Paris in 1844; the lancers was introduced by Laborde in 1861; and the waltz, originally Bavarian, and now modified from its original form, promises to retain its supremacy.

Characteristic of particular races or merely of classes of people are such forms of the dance as the Scotch reel, Highland fling, and strathspey, the Irish jig, the negro break-downs, sailors' hornpipe, step-dances, the can-can, morris dances, etc.

A ballet is a theatrical exhibition composed of dancing, posturing, and pantomimic action. The Roman pantomimes bore a strong resemblance to the modern *ballet d'action*. In an entertainment given to celebrate the victory of Actium, the "Trachiniae" of Sophocles, and an erotic interlude founded on the myth of Leda, were performed in dumb show, the dancers Pylades and Bathyllus taking the leading parts; and the whole wound up with a Pyrrhic war-dance. Some tradition of this form of entertainment, doubtless, suggested the courtly dances which became fashionable in the early days of the Renaissance. The first on record was that given by Bergonzio di Botta, at Tortona, to celebrate the marriage of the Duke of Milan in 1489. This was famous throughout the civilized world. From that time great events, such as royal marriages and births, were celebrated by grand productions of ballet on which enormous sums of money were lavished. These ballets were frequently historical in subject, treating of the siege of Troy, the conquests of Alexander, and similar events. There were also mythological, poetical, moral, and fantastic ballets, on such subjects as the Judgment of Paris, the Seasons, Truth, the Diversions of the Carnival, etc. All these were in five acts, each of which consisted of 3, 6, 9, or 12 entries, and in all of them singing and recitation mingled with the dancing.

Catharine de Medici introduced the ballet into France, and encouraged dances by females that would now be deemed highly improper, to distract the attention of her son, Henry III., from state affairs. Henry IV. was a great supporter of the ballet, no fewer than 80 grand entertainments being given by him between 1580 and 1610. Louis XIII. and Louis XIV. carried their love of ballet to an extreme length, and themselves danced publicly. In 1661 the latter founded an Academy of the Dance, with Quinault as director, and Lully as composer. It was not until 1681 that female dancers appeared in

DANCING DISEASE — DANDIE DINMONT

public, the first being four ladies, who danced "La Triomphe de l'Amour." In the early part of the 18th century the names of professional dancers began to appear, two of the most famous being Mlles. Salle and Camargo, immortalized by Voltaire. The great male dancer of this time was Dupré, the predecessor of the universally known Gaetano Vestris.

In 1697 De la Motte introduced more changes into the ballet, chiefly in the direction of more interesting subjects, and about the same time comic ballets were invented by Danchet; but no important alterations were made till the advent of Jean Georges Noverre in 1749. The dancers wore masks, huge wigs, and headdresses, and hoops. The mask finally disappeared in 1773. Hitherto the form of the ballet had remained practically unchanged, each act being performed by different dancers, and generally in different styles of dancing. Noverre invented the *ballet d'action*, and revived the art of pantomime. Dancing now had dramatic meaning, and the most intricate plots were represented by pantomime alone. The principles of Noverre were carried to great perfection by Vincenzo Galleotti in Copenhagen, and by his successor, Bournonville. Under the Directory a form of grand ballet was revived, in which patriotic songs were a feature.

The history of the ballet since Noverre's time is a history of dancers rather than of dancing. In England, this class of entertainment was never more than an exotic, and has practically no history. The word *balette* is first used in English by Dryden (1667), and the earliest attempt at a descriptive ballet seems to have been 'The Tavern Bilkers,' played at Drury Lane in 1702. Within the last few years an important revival of the ballet has taken place in Italy, where the famous "Excelsior," by the Chevalier Luigi Manzotti, Messalina, Amor, etc., have furnished magnificent examples of the *ballet d'action*.

Skirt-dancing, so called on account of the voluminous skirts made of sheer or flimsy material, which are worn by the dancers and play so important a part in their dances, has become a science and a popular attraction on the stage. The dancers, by the clever manipulation of their draperies and assisted by light effects, assume such forms as flowers; the rose, calla lily, pansies, pinks; butterflies of different colors, and flags of various nationalities; all to the accompaniment of music. Among the most noted skirt dancers were Amelia Glover, Loie Fuller, the inventor of the serpentine dance, Papinta, and Anna Held.

DANIEL FROHMAN.

Dancing Disease, an epidemic nervous disorder, apparently allied to hysteria and chorea, occasionally prevalent in Germany and Italy during the Middle Ages. In the last-mentioned country the disease was ascribed to the bite of a spider called the tarantula; but as scarcely any of those affected with it had any consciousness of being bitten by a spider or any other insect, and as it has been in every instance chiefly propagated by physical contagion, like chorea, there is every reason to conclude that it had a like origin. In 1734, during the celebration of the festival of St. John, at Aix-la-Chapelle, the streets became crowded with men and women, of all ranks and ages, who commenced dancing in a wild and frantic man-

ner, many losing entire control over themselves, and continuing to dance until dropping down from fatigue, and some, in a moment of frenzy, dashing out their brains against walls. The mania spread to Cologne, Metz, and Strasburg, and gave rise to much imposture, profligacy, and disorder. At the beginning of the 17th century the epidemic began to decline; and is only known now as a nervous affection in individual cases.

Dancing Faun, a frolicsome sylvan creature, half-human, half-goat, corresponding to the Greek Satyr, only gayer and less hideous than his woodland brother; often used in ancient comedy as the very embodiment of humor and mischief. Poets, painters, and sculptors of every age have loved to depict the faun in the madness of dancing.

Rough Satyrs danced and Fauns with cloven heel
From the glad sound would not be absent long.
Milton, *Lycidas*, l. 34.

Dancla, Jean Baptiste Charles, zhôn báp-têst shârl dân-klâ, French musical composer and violinist: b. Bagnères de Bigorre 19 Dec. 1818. He was a pupil at the Conservatory of Paris, where he took the first prize for the violin in 1833, at the age of 15, becoming professor there in 1857. He displayed remarkable fecundity as a composer, among his works being: a 'Method of the Violin,' studies, sonatas, solos, fantasies, and airs for that instrument; symphonies, trios, and quartettes for stringed instruments; 'Christopher Columbus,' a dramatic scene for an orchestra; a volume of 'Notes and Souvenirs' (1893).

Dancourt, dăn-koor, Florent Carton, French actor and playwright: b. Fontainebleau 1 Nov. 1661; d. Courcelles-le-Roi, France, 6 Dec. 1725. Although he personated the first characters in high comedy, he succeeded best as an author in low comedy. He displayed much ingenuity and wit in introducing upon the stage amusing subjects of real occurrence in his time. Louis XIV. was very fond of humorous pieces, and Dancourt often used to read his productions to the king before they were played. Among his dramas are: 'Le Chevalier à la Mode' (1687); 'Les bourgeois de qualité' (1700); 'Les trois cousins' (1700).

Dandelion, the common and well-known plant, *Taraxacum officinale*, belonging to the chicory family. It yields a milky juice, which in the form of extract is used medicinally as a diuretic and alterative. It contains a bitter crystalline principle called taraxacin. Its root has been used to adulterate coffee in a similar way to chicory, and is used to adulterate chicory itself. The blanched leaves are eaten as a salad. In America it is a common article of food in the spring of the year, boiled and eaten as "greens." It has a naked, hollow stalk, with a single bright yellow flower. The seed is furnished with a fine white pappus, by means of which it is carried far and wide by the wind. The leaves are lanceolate and sinuous, rising from a taproot in the form of a rosette. The plant is probably native in certain parts of America, but is found as a weed in all parts of the civilized world.

Dandie Dinmont, a small terrier, 8 to 11 inches high at the shoulder, and bred chiefly in Scotland as a pet. It is generally bluish-gray, or tan in color; its coat is soft and silky; and its eyes are a soft hazel. It is a gentle and affec-

tionate little creature, and has become celebrated in literature through the writings of Sir Walter Scott, one of whose favorite dogs was among the earliest of this breed.

Dandolo, Andrea, än-drä'ä dän'dō-lō, Doge of Venice and Italian historian: b. about 1310; d. September 1354; and made doge in 1343. He carried on a war against the Turks with various success, and greatly extended Venetian commerce by opening a trading connection with Egypt. The jealousy entertained by the Genoese of this new trade produced a war between the two states, which gave rise to a correspondence between the doge and Petrarch, who exhorted him to peace. To Andrea Dandolo is ascribed the compilation of the sixth book of Venetian statutes; but he is most distinguished for his 'Chronicle of Venice,' written in Latin, and comprehending the history of the republic from its commencement to 1342. It is praised for its impartiality, and for its judicious use of authentic documents, and was first published by Muratori in his collection of original Italian historians.

Dandolo, Enrico, ən-rē'kō, Doge of Venice: b. Venice about 1108; d. Constantinople 14 June 1205. He was chosen to office in 1192, at the advanced age of 84. He had a defect of sight approaching nearly to blindness; but neither that circumstance nor his age impaired the vigor of his administration, the events of his government being among the principal causes of the Venetian greatness. On the formation of the league for the fourth Crusade, under Baldwin, Earl of Flanders, Dandolo induced the senate to join in it, and by his policy the first hostilities of the armament were directed against Zara, which had revolted from Venice. On the storming of Constantinople, the aged doge, it is said, was the first who mounted the walls. On the Crusaders proceeding to the election of a new emperor of the city Dandolo was first nominated; but in consequence of his age, and the incompatible character of doge, he declined, and the choice ultimately fell on Baldwin. In the sharing of the imperial dominions Venice obtained a full moiety, and Dandolo was solemnly invested with the title of Despot of Romania.

Dandruff, a condition of scaliness in the head, attended with desquamation or scaling of the superficial layers of epidermis. It may simply indicate a dry and unhealthy skin, or it may be the result of several distinct skin diseases, chief of which is pityriasis. There is usually a slight amount of itching, and on scratching the head large quantities of minute scales are detached and fall on the clothing. Dandruff also occurs from seborrhœa, in which case it is due more to a mild inflammation of the fat follicles of the skin. The sebaceous matter from the glands dries and forms scales. One of the general results arising from dandruff is a gradual loss of hair. The treatment consists in better hygiene of the head, shampoos, and careful stimulation by appropriate tonics. Many of the so-called hair tonics are valueless. Vigorous rubbing of the scalp, with periodical shampooing, is one of the best means of combating this condition, but medical advice should always be sought as to the exact cause of the dandruff. See HAIR.

Dane, Nathan, American jurist: b. Ipswich, Mass., 27 Dec. 1752; d. Beverly 15 Feb.

1835. He was graduated from Harvard in 1778, studied law in Salem, Mass., and began practicing in the adjoining town of Beverly in 1782, where he resided until his death. He was among the most eminent lawyers in New England, and was at various times a member of the State legislature. In 1812 he was chosen an elector of President of the United States; in 1814 he was a member of the Hartford convention; and in 1820 he was chosen a member of the convention for revising the constitution of Massachusetts. While he was a delegate from Massachusetts to the Continental Congress in 1786, the best method of providing for the government of the vast territory owned by the Confederacy north and west of the Ohio River came into consideration. It was determined to do this by an ordinance which should establish with much detail not only the foundation of that government, but the leading principles which should prevail in the systems of law and public policy to be in force there. The drafting of this instrument was intrusted to Dane; and it was adopted by Congress without a single alteration, 13 July 1787. The clause in it which has been the subject of most frequent and emphatic remark is that which provides "that there shall be neither slavery nor involuntary servitude in the said territory." The name of the "Northwest Territory" was given to it; and it comprehended all the territory at that time belonging to the Confederacy northwest of the Ohio. Not long before his death, he stated in conversation that not until this ordinance was on the eve of enactment did the thought occur to him of inserting in it this clause respecting slavery. He incorporated in this ordinance a prohibition against all laws impairing the obligation of contracts, which the convention that formed the Constitution of the United States, a few months afterward, extended to all the States of the Union, by making it a part of that Constitution. His 'Abridgment and Digest of American Law' appeared 1823-9. In 1829 he imparted new vigor and life to the law school in Harvard University, in Cambridge, by giving \$10,000 (adding \$5,000 more in 1831) for the foundation of the Dane professorship of law.

Dane, The Great, one of the breed of large close-haired dogs, originating in Denmark. It is very powerful and intelligent, and is esteemed by sportsmen as a perfect boarhound. These huge dogs resemble the type of the ancient war-dogs. The minimum height of a typical Great Dane is 30 inches and the weight 100 pounds. The body is compact and long; the ears small; eyes small and deep-set. The colors vary, running through gray, mouse-color, white, fawn, red, etc., and sometimes present patches or stripes.

Danebrog, dän'ē brög, the Danish national flag (*brog* simply meaning cloth), which was carried at the head of the army, like the oriflamme of France. It is red with a white cross in the centre, and, as the legend has it, fell from heaven, as an omen of victory, when the pious Danes under Waldemar II. were besieging the pagan town of Reval. In memory of this auspicious event the king founded the order of the Danebrog, which fell into abeyance, however, at a later period. In 1671, under Christian V., and again under Frederick VI., it was revived. It may be conferred upon all ranks, and may be awarded for military or civil services. The dec-

oration consists of a white enameled gold cross, suspended by a white ribbon with a red border.

Danegeld, dān'gēlt, or **Danegelt** (A.-S. *Dene*, Danes; *gild*, *geld*, payment), an ancient annual tax of the Anglo-Saxons, to maintain forces to resist the Danes. It was first paid in 991, when Ethelred purchased the retreat of the invaders, which had reached as far as Maldon. The tax was continued until the time of Stephen, as one of the rights of the crown.

Danelagh, dān'lā, the ancient name of a strip of territory extending along the east coast of England from the Thames to the Tweed, ceded by Alfred the Great to Guthrun, king of the Danes, after the battle of Ethandune. This name (Danelagh or Dane-law) it retained till the Norman conquest, and its inhabitants were governed by a modification of Danish law and not by English law. King Canute, to prevent any changes in the laws, had them gathered together and taught to the people.

Danenhower, dā'nēn-how-ēr, **John Wilson**, American Arctic explorer: b. Chicago, Ill., 30 Sept. 1849; d. Annapolis, Md., 20 April 1887. He was graduated at the United States Naval Academy in 1870, and took part in a surveying expedition to the northern Pacific on the Portsmouth. He joined the Jeannette expedition, which started from Havre, France, went to San Francisco, and thence sailed, 8 July 1879, for the Arctic Ocean, via Bering Strait. The vessel was lost in the ice and the crew after dragging their boats over the frozen deep for 95 days, reached the open sea. A terrible storm separated the boats and none ever was heard of except the one in which Lieut. Danenhower had embarked. It reached Lena Delta, 17 Sept. 1881, and he arrived in the United States in June 1882. He wrote 'The Narrative of the Jeannette.'

Daneo, Giovanni, jō-vān'nē dā-nā'ō, Italian dramatist: b. St. Rémy, Piedmont, 16 May 1824. He wrote some dramas of very considerable merit: 'Suleika'; 'Elisa di Montalpino'; also novels: 'Memoirs of a Gentleman' and 'The Castle of Bardespina.' His poetical works consist of two volumes of miscellaneous 'Poems' and 'Verses,' with 'Gotama' and 'Rafaëlio Sanzio Temosforo.'

Danes, the natives of Denmark. The first mention of them was early in the 6th century, when they were living on the west coast of the Cimbrian Peninsula, whither they had gone from Scandinavia. Their written literature dates from the 13th century, but ancient runic inscriptions in the old Danish language have been found which date from the Viking age (700-1050). The folk-lore and legends that were transmitted from one generation to another, before printing was invented, are valuable contributions to the literature of the present. There are three separate dialects spoken which are represented by the people of Sweden, Zealand, and Jutland. The Zealand dialect became the literary form about the time of the Reformation, from which period modern Danish dates.

Danes Island, a place made noted by Andrée, the Arctic explorer, who, on 11 July 1897, started from this island on his fatal polar expedition. It is a small island off the coast of the Spitzbergen group and on the northwest.

Danewerk, dā'nē-vèrk (Danes' work), an ancient wall from 30 to 40 feet high and of an

equal thickness, constructed of earth, stone, and wood, about the middle of the 10th century, seemingly as a protection against the Saxons. It extended along the southern frontier of Schleswig for a distance of nearly 10 miles, and being defended by a series of forts the Danes relied upon it to check the approach of the German troops during the Schleswig-Holstein war of 1864. It was soon discovered that their army was too weak for the defense of so extensive a line, and the position was abandoned. The wall was soon after leveled to the ground.

Danforth, **Moseley Isaac**, American engraver: b. Hartford, Conn., 1800; d. 1862. He assisted in the founding of the National Academy of Design, spent 10 years in London, in which period he made some noted drawings of the Elgin Marbles, and returning to the United States devoted his attention mainly to the engraving of bank notes.

Danhauser, **Joseph**, yō'sēf dān'how-zēr, Austrian painter: b. Vienna 18 Aug. 1805; d. 4 May 1845. He turned his attention at first to historical painting, and living for some time at Venice, fell under the influence of the works of Titian and Paolo Veronese, and followed religious painting for a while, later becoming a genre painter, which better suited his talent. Among his historical pictures is 'Etienne the Fortunate Offering the Crown of Hungary to the Virgin' (1832). An altar piece in the cathedral at Erlau, representing the martyrdom of St. John, and an 'Abraham Driving Away Hagar and Ishmael' are noted among his religious pictures. He is perhaps best known by his humorous scenes depicting the manners and customs of Austrian life. Of these there are several in the Imperial Museum at Vienna. Many of his works have been popularized by engraving, such as: 'Cured without knowing it'; 'The Oculist'; 'The Prodigal'; 'Reading the Will'; 'Soup at the Convent'; 'Wine, Women, and Song'; 'Judge and Lawyer'; and 'The Evening Festival,' his last work.

Daniel, Hebrew prophet. He was a contemporary of Ezekiel, and was born of a distinguished Hebrew family. In his youth 600 B.C. he was carried captive to Babylon, and educated in the Babylonish court for the service of King Nebuchadnezzar. After three years he entered into the service of this monarch and discharged his employments with much credit to himself and without violating his conscience. A decree of the king which he could not conscientiously obey occasioned his being thrown into the lions' den. Preserved by a miraculous providence he was subsequently elevated to the office of governor and prime minister in the court of the Persian king Darius. Cyrus finally gave him permission to return with his people to Palestine. He ranks with what are called the "greater," in contradistinction to the 12 "minor" prophets. See DANIEL, BOOK OF.

Daniel, **Anthony**, French Jesuit missionary in North America: b. Dieppe 1601; d. 4 July 1648. In company with the Sieur de Champlain he came to Quebec in 1633 and was soon after transferred to the mission among the Huron Indians. He was shot during an attack upon the town of Saint Joseph by a band of hostile Iroquois.

Daniel, John Moncure, American journalist: b. Virginia 1825; d. 1865. He became a member of the staff of the Richmond *Examiner* in which capacity his free speech obliged him to engage in several duels. He was appointed minister to Sardinia in 1853, but his indiscreet action in several matters seriously impaired his influence as a diplomatist. During the Civil War he served in the Confederate army for a time, but resuming his editorship of the *Examiner* attacked in its columns the president and treasurer of the Confederacy, and in consequence was obliged to fight a duel with the latter.

Daniel, John Warwick, American politician: b. Lynchburg, Va., 5 Sept. 1842. He served in the Confederate army during the Civil War; subsequently studied law and entered upon the practice of his profession. He was a member of both Houses of the Virginia legislature 1866-72 and 1875-81; and was defeated for governor of his State in 1881. He was a member of Congress 1885-7; entered the national Senate in the year last named and was re-elected at the expiration of his term. He has published 'Attachments Under the Code of Virginia'; 'Negotiable Instruments,' etc.

Daniel, Samuel, English historian and poet: b. Taunton, England, 1562; d. Beckington, Somerset, 14 Oct. 1619. As an historical poet Lucan seems to have been his pattern. He bestowed much labor on the poem which describes, in eight books, the civil wars between the houses of York and Lancaster, 'History of the Civil Wars between the Houses of York and Lancaster.' Daniel contributed much to the improvement of the poetical diction of England. His stanzas, formed with a careful attention to the Italian octave, have more dignity and euphony than most verses of this sort in English literature in the first half of the 17th century. He is not wanting in rhetorical beauty and force. He was also the author of some poetical epistles, pastorals, 57 sonnets, and a few tragedies. The first seem to have excited much attention. During the reign of Queen Elizabeth he wrote a sketch of the history of England till the time of Edward III.—a work learned and clear, without ostentation, and containing useful and acute views.

Daniel, Book of, an important canonical book of the Old Testament. It stands in our Bible, as well as in the LXX. and Vulgate, immediately after Ezekiel, while in the Hebrew canon it is not included in the collection of the Prophets, but appears among the miscellaneous 'Writings.' Delitzsch points out that the book nowhere claims to be written by Daniel, and that its position in the canon shows that it is not properly a prophetic book, but an apocalypse. It is written partly in Hebrew, partly in Aramaic, but forms a coherent whole, which is now divided into 12 chapters, the first half consisting of narrative, the second half of predictions. These predictions are not prophetic speeches like those of the other prophetic scriptures, rebuking the sins of contemporaries, foretelling judgment on the impenitent, and promising Messianic salvation to the repentant and believing; they are minutely detailed apocalyptic visions embracing the history of four successive world-empires—the Chaldaean, the Median, the Persian, and the Greco-Macedonian—culminating in the establishment of the eternal kingdom of the saints of

the Most High. Objections to the Danielic authorship of the book were made by the Neoplatonist Porphyry as early as the 3rd century A.D., but first found support in the critical investigations of Bertholdt (1806-8), followed by those of Bleek, De Wette, Langerke, Ewald, Lücke, and others. These investigations have led to the view that the book was not written till the time of the religious persecution of Antiochus Epiphanes, about 168-5 B.C. But the book is certainly of great importance, and "has exercised," says Schürer, "a profound influence upon the form of the Messianic idea. . . . In this book (xii. 2) the hope in a resurrection of the body is for the first time plainly and decidedly expressed. The Messianic hope is here the hope of a glorious future for the nation, but with the double modification that the future kingdom of Israel is conceived of as a universal kingdom and that all the saints who have died will share in it." According to Delitzsch, our Lord's testimony in Matt. xxiv. 15 proves "that Dan. ix. 26, et seq., is a prophecy of the desecration of the temple in the Roman war, not that it is a prophecy then fulfilled for the first time." See Hilgenfeld, 'Die Jüdische Apokalyptik' (1857); and the special commentaries by Hitzig (1850), Auberlen (3d ed. 1874), Hilgenfeld (1863), Caspari (1869), Pusey (1864), Desprez (1879), and Robinson (1882).

Daniel Deronda, George Eliot's last novel, considered by some critics her greatest work. Deronda was brought up in ignorance of his Jewish parentage, but ultimately cast in his lot with his own people. The influence of Deronda remolds the character of the heroine, Gwendolen Harleth, who is unhappily married to Grandcourt. In 'Daniel Deronda' George Eliot had three objects in view: (1) To show the influence of heredity; (2) to show that ideals and sentiments lie at the basis of religion; (3) to contrast a social life founded on tradition (that of the Jews) with mere individualism. The novel was first published as a whole in 1877.

Daniell, John Frederic, English scientist: b. London 12 March 1790; d. 13 March 1845. He was elected a Fellow of the Royal Society in 1814, and devoted himself to chemistry and meteorology. In 1823 he published his 'Meteorological Essays'; and in 1831 was appointed professor of chemistry in King's College, London; and in 1839 published his 'Introduction to Chemical Philosophy.' In 1843 he received the degree of D.C.L. from the University of Oxford, and obtained all the three medals in the gift of the Royal Society. He invented a hygrometer (1820), and a new pyrometer (1830), as well as the electric battery known by his name; and he wrote many valuable papers on chemistry, especially on voltaic combinations and electrolysis.

Daniell, Samuel, English artist and traveler: b. London 1777; d. Ceylon 1811. He was a brother of William Daniell (q.v.). He spent three years at the Cape of Good Hope, and afterward proceeded to the interior of Africa, making sketches of the scenery and people, which he brought home with him to England in 1804, when they were published, with an account of the animals of southern Africa. He afterward went to the island of Ceylon, and during a residence of six years collected a large amount of similar materials, one volume of which was

published, with a description of that country and its inhabitants, in 1808.

Daniell, Thomas, English landscape painter and engraver: b. 1749; d. London 1840. In company with his nephew, William Daniell (q.v.), he made an extraordinary journey through India, for the purpose of preparing sketches and illustrations of the scenery, which were afterward published with the title 'Oriental Scenery' (1808). He was originally a heraldry painter, and became Fellow of the Royal, Asiatic, and Antiquarian societies. He published also 'Views in Egypt'; 'Hindu Excavations at Ellora'; 'Picturesque Voyage to China by Way of India' (1817).

Daniell, William, English painter and engraver: b. 1769; d. 1837. He set out at the age of 14, in company with his uncle, Thomas Daniell (q.v.), upon an artistic exploration of the peninsula of Hindustan. They began their journey at Cape Comorin, and sketched almost every thing beautiful or interesting in the country between that point and Serinagur, in the Himalaya Mountains. They were occupied 10 years in this undertaking. Of their immense number of sketches, they selected and published a portion in a great work entitled 'Oriental Scenery' (1808). William also published 'A Picturesque Voyage to India'; 'Zoography'; 'Animated Nature', etc., and from 1814 to 1825 was engaged in making sketches for 'A Voyage round Great Britain.'

Daniels, Cora Linn, American author: b. Lowell, Mass., 17 March 1852; married Joseph H. Daniels 1874. She has written much for the press and has published in book form: 'Sardia' (1892); 'As it is To Be: Psychical Philosophy' (1892-1900); 'The Nurse'; 'Omar Khayyam'; 'The Bronze Buddha' (1899); 'Encyclopedia of Superstitions of the World' (1901).

Daniels, Frank, American actor: b. Dayton, Ohio, 1860. He was educated in Boston, Mass., and made his appearance on the stage there in 1883. His first success was in 'A Rag Baby' and he has since acted in many farces and light operas.

Daniels, William Haven, American prose writer: b. Franklin, Mass., 18 May 1836. He was for some years in the Methodist ministry. He has published: 'That Boy: Who Shall Have Him?' (1878); 'The Temperance Reform and Its Great Reformers' (1878); 'Moody, His Words, Work, and Workers' (1879); 'Illustrated History of Methodism in the United States' (1880); 'A Short History of the People Called Methodist' (1882).

Danites, dān'its, a former secret society of the Mormon Church, for militant action against its enemies. It was organized by Joseph Smith at Kirtland, Ohio, 30 March 1836, by a "covenant" to avenge any further expulsion of the Missouri Mormons by mobs; on the basis of a "revelation" of 6 Aug. 1833, justifying any Mormon in "rewarding thine enemy according to his works." The first name chosen was Daughters of Zion, from Micah iv. 13; this not

seeming graphic, it was changed to Destroying Angels, or Flying Angels, the former used for many years; then the Big Fan (Jer. xv. 7 or Luke iii. 17); then Brothers of Gideon; finally Sons of Dan, turned by outsiders into Danites, from Gen. xlix. 17. A constitution was adopted, giving the executive power to the president of the Church and his counselors, and the legislative power to the same, with the generals and colonels of the society; this legislature to have power to "administer punishments to the guilty in accordance with the offense." The oath taken by the members was to obey the Prophet and First Presidency "in all things, the same as the supreme God"; to "stand by my brethren," and "uphold the presidency, right or wrong"; and invoking terrible punishments for revealing the secrets of the society. The Mormons have usually denied that the society existed, or if so that it was countenanced by the Church; and Smith's Nauvoo council denied its existence there. Brigham Young, however, boasted of its existence in Salt Lake City. Its actions, from the nature of the case, can only be inferred. It is usually credited with all the deeds of blood charged against the Mormons, including the Mountain Meadows massacre (q.v.). The name was attached by the Douglas Democrats to the administration (Buchanan) Democrats in the Lincoln-Douglas senatorial Illinois campaign of 1858, as an insinuation that they were Buchanan's tools in upholding the Utah rebellion.

Dannat, William T., American figure painter: b. New York 1853. He was a pupil of the Royal Academy, Munich, and of Munkacsy in Paris, and took the medal of the third class in Paris 1883. Among his works are: 'Bavarian Peasant' (1878); 'Aragonese Contrabandist' (1883); 'Castanet Dance; A Quartette' (1884).

Dannecker, Johann Heinrich, yō'hān hīn'-rīn dān'nēk-ēr, German sculptor: b. Waldenbach, near Stuttgart, 15 Oct. 1758; d. Stuttgart 8 Dec. 1841. At the Karlschule he devoted himself so successfully to sculpture that a statue of Milo of Crotona, executed in his 17th year, excited great admiration. On leaving he was appointed court sculptor, and three years after visited Paris and Rome. In the latter city he executed a Ceres and Bacchus, which procured him admission into the academies of Bologna and Milan. In 1790 he returned to Würtemberg, and became professor of the fine arts at Stuttgart. From this period he continued his professional labors with most brilliant success, and was patronized by the most distinguished personages in Germany. His acknowledged masterpiece is a statue of Christ, which occupied him during eight years, and the prototype of which is said to have been suggested to him in a dream. His 'Ariadne seated on the Panther' is a splendid work, and in the opinion of some critics is superior as a work of art to his 'Christ.' As a sculptor he occupies an intermediate place between Canova and Thorwaldsen, having blended in the happiest manner the spirited conception of the former with great anatomical skill, careful execution, and nice appreciation of nature. See Radcliffe, 'Schools and Masters of Sculpture' (1894).

Dannemora, dān-ne-mō'ra, N. Y., a village in Clinton County; on the Chateaugay Railroad; 12 miles west of Plattsburg. Here is located one of the State prisons called Clinton State

Frison. The iron ore found in the vicinity is of an excellent quality. Pop. 4,213.

Dannemora, dän-nē-moo'rā, Sweden, a straggling village, on a lake of the same name, 24 miles northeast of Upsala, in the district of Upsala. It is celebrated for its iron mines, the second richest in Sweden, which have been worked uninterruptedly for upward of three centuries, and produce the finest iron in the world. The mine has been sunk more than 100 fathoms, and as part of the workings runs under the lake, great trouble is sometimes experienced in keeping out the water. The total quantity of ore raised is about 70,000 tons per annum. It consists of 86 to 90 per cent magnetic oxide of iron, 7 to 12 per cent silica, and traces of manganese, lime, magnesia, and alumina, the earthy matters being in the proportion to form a fusible slag without further addition. It is almost free from sulphur and phosphorus, and as the charcoal fuel employed in smelting is also free from these impurities, the Dannemora iron enjoys the highest reputation, and is in great demand for conversion into steel.

Dannreuther, dän'roi-tēr, Edward, English pianist and conductor: b. Strasburg, Germany, 4 Nov. 1844. He was educated at Cincinnati, Ohio, studied music at Leipsic under Moscheles, and in 1863 went to London where he afterward settled and lectured on Wagner, Bach, Beethoven, etc. He conducted the first Wagner concerts in London 1873-4, and has published: 'Musical Ornamentation'; 'Richard Wagner: His Tendencies and Theories'; 'The Music of the Future'; 'On Conducting.'

D'Annunzio, Gabriele. See ANNUNZIO GABRIELE D'.

Dantan, Antoine Laurent, än-twān lō-rōñ dän-tāñ, called Dantan the Elder, French sculptor: b. Saint Cloud 9 Dec. 1798; d. there 31 May 1878. He was a pupil of Bosio, taking the second grand prize of Rome for sculpture in 1823 and the first prize in 1828, the latter for a 'Death of Hercules.' Yielding himself, at first, entirely to the influence of the antique in his art, he afterward found a more original style. He obtained the decoration of the Legion of Honor in 1843, and secured a medal of the third class at the Exposition in 1855. Among his works are: 'Young Bather and Dog' (1835), which took a medal of the first class 1833; 'Drunkenness of Silenus' (1836); a bronze 'Young Girl and Tambourine' (1838); 'Statue of Louis Joseph de Bourbon'; 'Statue of the Maréchal de Villars'; 'Bust of the Dauphin of France.' A monumental 'Juvenal des Ursins' was ordered for the Hotel de Ville in Paris 1838; and 'The Angel Raphael' for the Madeleine 1839. 'Duquesne' was made for Dieppe in 1844, and a 'Saint Christopher' for the church of La Villette in 1846. He was the author of many statues decorating the monuments of Paris, the churches of Saint Gervais, Sainte Clotilde, Saint Laurent, the Tower of Saint Jacques, the belfry of Saint Germain l'Auxerrois, and the new Louvre, besides busts for the museum at Versailles, the senate, and the Comédie Française.

Dantan, Jean Pierre, zhōñ pē-ār (called 'DANTAN THE YOUNGER'), French sculptor: b. Paris 26 Dec. 1800; d. Baden 6 Sept. 1869. He was a brother of A. L. Dantan (q.v.). He

achieved great reputation for his diverting caricatures of prominent men, such as: Paganini, Rossini, Victor Hugo, Frederic Soutie, Balzac, Alexander Dumas, Frederic Le Maitre, and of himself, which were exhibited at the Dantan Museum in Paris, but his popularity as a caricaturist injured to some extent his fame as a serious artist. Among his works are statues of Boieldien, at Rouen; Philibert Delorme, at the Louvre; and busts of Adelaide Kemble, Rose Cheri, Canrobert, Jean Bart, Pleyel, Rossini, Thalberg, Duke of Wellington, and Lord Brougham.

Dantan, Joseph Édouard, zhō-zēf ā-doo-ār, French painter: b. Paris 26 Aug. 1848; d. Villerville 1897. He was a son of J. P. Dantan (q.v.). He was a pupil of Pils, but soon abandoned historical and religious for genre painting. Among his works are: 'The Holy Trinity'; 'An Episode of the Destruction of Pompeii' (1869); 'A Monk Carving a Christ in Wood'; 'Hercules at the feet of Omphale' (1874); 'The Nymph Salmacis and the Young Hermaphrodite' (1876); 'Vocation of the Apostles Peter and Andrew' (1877); 'The Corner of a Studio' (1880); in the Luxembourg; 'Breakfast of the Model' (1881); 'Interior at Villerville' (1883); 'The Studios' (1884); 'The Widower' (1885); 'Modeling from Nature' (1887).

Dante (originally DURANTE) **Alighieri**, dän'tā a'lē-gē-ā'rē, Italian poet: b. Florence May 1265; d. Ravenna, Italy, 14 Sept. 1321. He was of a family belonging to the lower nobility, and of mixed descent, the Aldighieri, or Alighieri, being originally Teutonic. He lost his father in early life, but his mother watched carefully over his education, which was confided to the eminent philosopher and statesman, Brunetto Latini. He is said to have studied at Bologna, Padua, Naples, and even Paris and Oxford, but we have no means of confirming the statement in any measure. What is tolerably certain is that he had mastered the learning of that age. He was a musician and painter, a theologian and linguist of no mean order. Many of his biographers state that it was in 1274, when nine years of age, that he saw for the first time, and ever afterward devotedly loved, Beatrice Portinari. Others affirm that that event took place shortly before her death, in 1290, three years after she had married a noble Florentine, Simone Bardi. His love for her awakened in him a new life; all the powers of his soul were to be henceforth devoted to immortalize her, and we can watch the struggles of his spirit in that record he has left us of his early years, the 'Vita Nuova.' About the period when Dante reached the age of manhood the Guefs (the Papal or Church party) were predominant in Florence, whence they had, aided by the Pope and Charles, king of Naples, driven the Ghibellines (the imperial or state party). At Arezzo, on the other hand, the Ghibellines had succeeded in exiling the Guefs, who implored the assistance of their Florentine friends. A war was declared between the two cities, which was terminated in June 1289 by the battle of Campaldino, in which the Ghibellines were defeated. Dante was there fighting bravely, and contributed not a little to the victory of the Guefs. In 1291 he married Gemma dei Donati, a daughter of one of the most powerful families of the state, and which belonged to the Guelf

DANTE ALIGHIERI

faction. By this lady he had seven children, the youngest, Beatrice, being born about 1301. In 1293 a revolution broke out in the city, headed by Giano della Bella, whereby the priors of the trades took the power into their own hands, and made nobility a disqualification for holding office. The following year, however, Giano della Bella was deprived of power, and the nobles disagreeing among themselves, and splitting into two factions, the Bianchi and the Neri (the White and the Black), the streets of Florence were continually the scenes of sanguinary fights. In order to check the excesses of the greater nobles, a number of the lesser nobility, Dante among them, threw in their lot with the citizens' party. In order to render himself eligible for office Dante had his name inscribed in the books of the physicians and apothecaries, and in June 1300 was nominated a prior of the trades, one of the highest offices in the state. Although leagued by marriage to the Guelph side, Dante was no rampant partisan, and on one occasion, when roused by some fresh act of atrocity, he proposed and carried a law to the effect that the heads of the Bianchi and Neri parties should be temporarily banished. It appears that the Bianchi and Neri were originally Guelphs, but the latter were the extreme Papal party, and the former leaned toward a reconciliation with the Ghibellines. Dante's sympathies were with the Bianchi, and on the too hasty return of one of the exiles, Guido Cavalcanti, a friend of the poet's, and one of the Bianchi, Dante was charged with undue partiality in permitting him to remain in the city. The Neri wrote to the Pope that the Bianchi were making common cause with the Ghibellines, and Boniface VIII. sent Charles of Naples to occupy the town, and keep down the turbulent spirit of the Florentines. The Neri were allowed, however, to commit the greatest excesses unchecked by Charles: many of their rivals were slain in the open street, and their houses burned to the ground; among others that of Dante, who had been sent to Rome by his party to try to influence the Pope in their behalf. Taking advantage of his absence, his enemies obtained a decree of banishment against him, together with the heads of his party, and he was further condemned to pay a fine of 8,000 florins, or have his property confiscated (January 1302). Two months later a second sentence was launched against him and several of his friends: they were condemned to be burned alive for malversation, peculation, and usury. The fine he refused to pay, as it would imply a confession of guilt.

From this time forth the life of the poet becomes semi-mythical. We find some traces of him first at Arezzo, then at Sienna, then at Verona. He himself says, "Through almost all parts where this language (the Italian) is spoken, a wanderer, well nigh a beggar, I have traveled, showing against my will the wounds of fortune." His sympathies now lay entirely with the Ghibelline party. The expedition of the emperor, Henry VII., into Italy (1310) roused the hopes of Dante to the highest pitch. He wrote the emperor that famous letter advising him first of all to crush the hydra, Florence, as being the cause of all the misfortunes of Italy. Henry, however, spent his time in foolish inactivity till his death in 1313. Shortly after this event Dante is said to have visited Paris; but according to Balbo he spent the year 1313-14

in Pisa and Lucca, and then took refuge with Can Grande della Scala at Verona, where he remained till 1318. In 1316 Florence sent forth a decree permitting the exiles to return on conditions of fine and penance, which Dante indignantly refused. In 1320 we find him at Ravenna staying with his friend Guido Novello da Polenta. In the following year, on his return from an embassy to Venice, his wanderings and sufferings were ended by death. He was buried in the Church of the Minorites, under a monument built by his friend Guido Novello, on which was an epitaph written by Dante himself. Such, imperfectly sketched, was the career of the great poet; by it he gained a sense of the nothingness of earthly honors and prosperity possible only to the rich, and a knowledge of man possible only to the poor. In his youth living amid the excitement of the tented field and penning sonnets to his adored Beatrice; in his old age compelled "to climb the stranger's toilsome stairs, and eat the bitter bread of others." Out of his misfortunes the world found her rich account; the apocalypse of the Middle Ages, the 'Divina Commedia,' was begun and finished in his year of exile. Of this grand poem we can give only a very brief analysis. It is divided into three parts: Hell, Purgatory, and Heaven. Each part is subdivided into 33 cantos, in allusion to the years of our Saviour's life, the extra canto in the first part being introductory. Dante dreams that he had "reached the half-way point in his path of life, at the entrance of an obscure forest." He would advance, but three horrible beasts bar the way; then the shade of Virgil appears and offers itself as his guide. Dante accepts, and then takes place that wondrous journey in the "world of souls." Virgil tells him he can only accompany him through hell and purgatory; but that Beatrice shall conduct him through those happy spheres, the portals of which a pagan may not enter. Now begin the peregrinations of the Florentine through the regions of the damned, over the entrance of which is written the awful words—"All hope abandon ye who enter here." This is the most impressive and best-known part of the poem: the singular diversity of the chastisements; the rapidity with which Dante passes in review the great criminals of history; the intensity with which he paints, at a single dash, so to speak, their distorted features; the grace of certain episodes (the adventure of Francesca da Rimini, the death of Ugolino, and that of Manfred), attest a vigor of imagination never surpassed, if ever equaled. From Hell (which the poet places in the centre of the earth) he ascends to Purgatory, a solitary mountain rising from the ocean on the side of the globe opposite to us. This mountain is divided into terraces, and its top is the terrestrial paradise, the first abode of man. In Purgatory there are still scenes of pain and suffering; but these punishments are only temporary. The poet hesitates when he comes to a path filled with a sheet of flame; but Virgil speaks: "Between Beatrice and thee there is but that wall." Dante at once plunges into the heart of the flames. The two poets have now reached the earthly paradise, and behold Beatrice surrounded by a scene of surpassing magnificence; noble forests, whose trees are gently moved by celestial zephyrs; the melodious songs of birds to which the murmuring of the sacred woods and streams give harmonious re-

DANTE ALIGHIERI

ply; meadows of the freshest green, and groves of deepest shade. From this enchanting region Dante ascends, faster than tongue or pen can tell, into the celestial paradise. This realm consists of 10 heavens or circles. Dante roams at first over the seven planets, the Moon, Mercury, Venus, the Sun, Mars, Jupiter, and Saturn; then he enters the eighth sphere, and at last into the empyrean. Each of these globes has its inhabitants, who are souls or spirits. Arrived at the eighth sphere, he looks down upon our globe; but the earth appears so abject that he smiles with pity upon it. Beatrice calls his attention to a nobler scene. "See the glorious company which surrounds the triumphant Redeemer." The eyes of the poet cannot sustain the splendor of the view. In the ninth sphere Dante feels himself in the presence of the Divine essence, hid from his sight by three hierarchies of angels. He sees the souls of the blessed on thrones in a vast amphitheatre, whose steps and circles widen into infinity. Beatrice takes her place upon her throne of glory; from that sublime height she smiles benignantly down upon the poet; then turns toward him who is the source of life and light. Thus ends the Divine trilogy, the noblest effort of the Middle Ages.

The name "Commedia" is derived from Dante's idea concerning the forms of eloquence, which were in his opinion tragic, comic, and elegiac, as he relates in his work 'De vulgari Eloquentia,' which was first written in Latin. What he called tragedy was a piece commencing with happy and peaceful scenes, and ending with events of a painful and terrible character, and what he called comedy was a piece which, beginning unpleasantly, terminated happily. The qualifying word *divina* was, however, added by others. We may mention the opinion maintained in 1753 by Bottari, that Dante made use of the 'Vision of Alberico' a monk who lived in the 12th century, in a monastery on Monte Cassino, in Naples. There have been many such visions from the earliest ages of Christianity; as, for instance, the 'Vision of an English Monk,' which Matthew Paris mentions in his 'History of England' (in the year 1196), and which resembled Dante's poem much more than the 'Vision of Alberico' published by Cancellieri in 1814 at Rome, with observations ('Osservazioni intorno alla Questione sopra la Originalità della Divina Commedia di Dante'). It is possible that Dante here and there may have borrowed a thought or image from those visions; but this is no fault: the recollections of great men are sparks which serve to kindle mighty flames.

There is no poet who bears so distinctly the impress of his age, and yet rises so high above it, as Dante. The Italians justly regard him as the creator of their poetical language, and the father of their poetry, which, regulated and controlled by his genius, at once assumed a purer and far nobler form than it had previously worn. The *terzina* first reached its perfection in the time of Dante, on which account he has been erroneously regarded as the inventor of it.

Florence soon recognized that she had lost her noblest son. In 1350 a sum of 10 golden florins was ordered to be paid by the hands of Giovanni Boccaccio to Dante's daughter, Beatrice, a nun in the convent of Santa Chiara at Ravenna. In 1373 an annual sum was granted for public lectures, to explain the 'Divine Comedy' in the churches, and Boccaccio was one

of the first lecturers. A monument was voted for if Ravenna would give up the now sacred remains, which that city refused, and has repeatedly refused to do. In May 1865 all Italy assembled at Florence to render homage to the seer who prophesied so confidently her unity; and the following year a colossal statue of the poet was erected on the Piazza della Croce.

The best editions of the 'Divina Commedia' are those of Lombardi (1791), frequently reprinted with valuable improvements, of Viviani (1823), of Bianchi (5th edition, Florence, 1857), of Karl Witte (Berlin 1862), etc. In 1821 Luigi Fantoni published an edition of the 'Divina Commedia,' stated to have been printed from a manuscript in the hand-writing of Boccaccio. In 1869 the 'Vernon Dante' was published in London by Lord Vernon, in three large volumes folio. It contains the text of the 'Inferno,' and, in Italian, an explanation of everything in the text regarding which any reader might have the least difficulty; together with an immense mass of information—biographical, topographical, historical, etc., relating to the life and times of Dante, and a large number of maps, plans, and illustrative plates. Dante's complete works appeared at Venice in 1757-8, published by Zatta (in 5 vols. 4to). His lyric poems, sonnets, and canzonets, of which some are beautiful, others dull and heavy, were written at different periods of his life. We have yet to mention his 'Banquet' (*Il Convito*)—a prose work worthy, says Bouterwek, to stand by the side of the best works of antiquity. It contains the substance of all his knowledge and experience, and thus illustrates his poetry and his life. The most popular English translation of the 'Divina Commedia' is that by Cary in blank verse (1814). Longfellow executed a faithful poetic version (1867); and that by Dean Plumptre in the original metre deserves mention. Other English translations are Boyd's (1785); Wright's (1833); Pollock's (1854); Parsons-Norton's (1891-2). The German translations are numerous, and are highly praised for faithfulness and force. The translation by Kannegieser is in the measure and rhyme of the original; that of Philaethes (King John of Saxony) has a deservedly wide reputation. The French have four or five translations, including one by Lamennais, but that graceful and feminine tongue is incapable of doing anything like justice to the manly thoughts of Dante.

In one respect Dante stands unrivaled by any man, as he, we might almost say, created the language, which he elevated at once to its highest perfection. Before him very little was written in Italian, Latin being the literary language; but no one attempted to use the *lingua volgare* for the purposes of dignified composition. The poet, indeed, thought it necessary to excuse himself for having written in Italian after having attempted to compose his poem in Latin. Thus he is to be regarded as the founder of Italian literature. One of the strangest productions of Dante is his 'De Monarchia.' He labors in this work to prove that the emperor ought to have universal authority and draws his arguments from the sacred Scriptures and from profane writers, which in this book appear very often with equal authority. The dialectics of the schoolmen are here exhibited in a most characteristic way. The 'De Monarchia' is valuable as a source of information respecting the great

DANTON

struggle of the Guelfs and Ghibellines, and its influence upon the Christian world at that time. This struggle was a part of the great convulsion attending the separation of the civil power from the ecclesiastical, with which in the earliest ages it is always united. On the whole, Dante's works are important chiefly in three respects—as the productions of one of the greatest men that ever lived, as one of the keys to the history of his time, and as exhibiting the state of learning, theology, and politics in that age. To understand Dante it is necessary to be acquainted with the history and spirit of his time, particularly with the struggle of the Guelfs and Ghibellines, the state of the north of Italy, and the excitement caused by the beginning of the study of the ancients; also to have studied the Catholic theology and the history of the court of Rome, and to keep always in mind that Dante was an exile, deprived of home and happiness. The personal appearance and character of the man are thus described by Boccaccio: "Our poet was of middle height; his face was long, his nose aquiline, his jaw large, and his under lip protruding somewhat beyond the upper. His eyes rather large than small; his hair and beard thick, crisp, and black, and his countenance sad and pensive. His gait was grave and gentlemanlike, and his bearing, in public or private, wonderfully composed and polished. In meat and drink he was most temperate. Seldom did he speak unless spoken to, though he was most eloquent. In his youth he delighted in music and singing, and was intimate with all the musicians and singers of the day. He was of marvelous capacity and the most tenacious memory; inclined to solitude and fond of study when he had time for it."

Danton, Georges Jacques, zhōrh zhāk dān-tōn, French revolutionist: b. Arcis-sur-Aube 26 Oct. 1759; d. Paris 5 April 1794. He played a very important part during the first years of the French Revolution, of which he was an active and zealous promoter. His external appearance was striking: his stature was colossal; his frame athletic; his features harsh, large, and disagreeable; his voice shook the dome of the chamber of the assembly; his eloquence was vehement; and his imagination was as gigantic as his person. These qualities contributed to extend his influence, and he became one of the founders of the club of the Cordeliers. After the capture of Louis XVI. at Varennes he took the lead in the meeting of the Champ-de-Mars, which demanded the dethronement of the king. He was foremost in organizing and conducting the attack on the Tuileries (10 Aug. 1792), and a few days afterward was appointed minister of

justice by the legislative assembly in recognition of his services on that occasion. He also became a member of the provisional executive council, and usurped the appointment of officers in the army and departments. Money flowed from all sides into the hands of the minister, and was as profusely squandered on his tools and partisans. He endeavored by the terrors of proscription to annihilate all hope of resistance on the part of the Royalists. The invasion of Champagne by the Prussians, 2 September, spread consternation through the capital and among the members of the government. The ministers, the most distinguished deputies, and even Robespierre himself now assembled around Danton, who alone preserved his courage. He assumed the administration of the state, and prepared measures of defense; called on all Frenchmen capable of bearing arms to march against the enemy, and prevented the removal of the assembly beyond the Loire. The close of his celebrated speech has been often quoted: "Le tocsin qu'on va sonner n'est point un signal d'alarme, c'est la charge sur les ennemis de la patrie. Pour les vaincre, il nous faut de l'audace, encore de l'audace, toujours de l'audace, et la France est sauvée!" From this time forward he was hated by Robespierre, who could never pardon the superiority which Danton had shown on that occasion. He voted for the capital punishment of all returning emigrants, and undertook the defense of religious worship. The contest between the Girondists and the Mountain daily assumed a more serious aspect, and Danton appeared to fear the consequences of these dissensions. Danton wished to overthrow the despotism of Robespierre, and the crafty Robespierre endeavored to undermine him, in order to get rid of a dangerous rival. St. Just denounced him to the Committee of Safety, and Danton was arrested on the night of 31 March 1794, together with those who were called his accomplices. Being thrown into prison in the Luxembourg he maintained the appearance of serenity. When transferred into the Conciergerie his countenance became dark, and he appeared mortified at having been the dupe of Robespierre. All his discourses were a strange mixture of sorrow and pride. At his trial, on the formal question as to his name and residence being put, he answered, with perfect composure, "I am Danton, sufficiently known in the Revolution; I shall soon pass to nothingness, but my name will live in the Pantheon of history." On 5 April the revolutionary tribunal condemned him to death as an accomplice in a conspiracy for the restoration of monarchy, and confiscated his large property. He mounted the fatal car with courage, and without assistance; his head was elevated; his look commanding and full of pride. Before ascending the scaffold he was for a moment softened. "Oh my wife, my dear wife! shall I never see you again?" he exclaimed, but checked himself hastily, and, calling out, "Danton, no weakness!" ascended the scaffold.

DANTZIC — DANUBE

Dantzic, Dantsic, or Danzig, *dänt'sin*, Germany, city and port of Prussia, capital of the province of West Prussia, 253 miles northeast of Berlin; on an arm of the Vistula (now cut off by a dam from the river), about three miles above its mouth, and on the Mottlau, several arms of which traverse the town. It is one of the most important seaports under the Prussian monarchy, as well as one of its chief commercial entrepôts. It is nearly circular in form, and ranks as a fortress of the first class, being surrounded by walls and bastions, defended by a citadel and several outworks, and also provided with the means of laying a considerable part of the surrounding country under water. It is entered by four gates, has nine suburbs, and is divided into five parts—the Old, New, and Low town, the Speicher (granaries), an island, and Langgarten. The last is the more modern part of the town, and is regular and well built. The principal edifice is the Dom, or cathedral, begun in 1343, but not finished till 1503. It is 360 feet long by 142 feet broad, and its vaulted roof, 98 feet above the pavement, is supported by 26 slender brick pillars. It possesses a fine brass font and a curious astronomical clock, which has long ceased to move, but its chief attraction is a painting of the 'Last Judgment,' attributed to John Van Eyck. The other buildings and institutions deserving of notice are the town-house, the church of St. Catharine, the oldest in Dantzic, and other churches; three monasteries, convents, two synagogues, the exchange, an imposing Gothic edifice, built in 1379. Many of the modern public buildings are models of architecture. It is the seat of the provincial government, and contains the various offices connected therewith; and is also the residence of several foreign consuls. The industrial establishments include an imperial ship-building yard employing some 1,500 men, several other shipyards, works for artillery and fire-arms, iron foundries, machine shops, steel works, breweries, distilleries, works producing the liqueur called *Danziger Goldwasser*, or *Eau de Vie de Danzig*, flour-mills, saw-mills, paper-mills, rope, wire, oil, chemical, soap, and glass works. Great efforts are being made to extend the manufacturing industries of the town, since as a shipping centre it seems to be declining owing to the competition of other ports, some of them more favorably situated. But the trade carried on is still very important, since the total value of exports and imports together amounts to about \$50,000,000 per annum. Much of the trade is of products in transit. Among imports the chief are coal, iron, cured herrings, salt, tallow, and lard, petroleum, rice, coffee, and some bread stuffs. The chief exports are timber, beet-sugar, grain and seeds, oil-cake, flour, spirits, and molasses. Dantzic has a great trade in grain, especially wheat, rye, and barley, for the warehousing of which there are immense granaries on the island of Speicher, capable of containing 100,000 tons. The wheat, which is chiefly Polish, is remarkable for both the quantity and the quality of the flour which it yields. There is considerable trade at Dantzic in amber, which is manufactured into various ornamental articles. The proper port of Dantzic is *Neufahrwasser*, at the mouth of the Vistula (now known as the dead Vistula), and connected with it by an artificial channel. Here a free port has recently been established. By dredging and otherwise,

various obstructions to navigation have been removed, and vessels of large size come up close to the town. The history of Dantzic reaches back to the times of historical obscurity. As early as 970 there was a town here. In 1271 it was taken by Mestwin, and in 1294 by the Poles. In the 14th century it fell into the hands of the Teutonic knights, under whose sway the town increased, and its commerce was extended. Left by the Teutonic knights, it again, in 1454, fell into the hands of the Poles, who granted it important privileges. After enduring many vicissitudes of fortune, on the second partition of Poland, in 1793, it came into possession of Prussia. It was besieged, bombarded, and taken by the French in 1807, and retaken by the Prussians in 1814. Since that time Prussia has done much for the town; but its commerce has never regained its former importance and extent. Pop. (1901) 140,563.

Danube (ancient, *DANUBIUS*; German, *DONAU*; Hungarian, *DUNA*), a famous river of Europe, originating in two small streams, the Brege and the Brigach, rising on the east slope of the Schwarzwald, a mountainous region of southwest Germany (the Black Forest), in the Grand-duchy of Baden, at an elevation of 2,850 feet above sea-level, and uniting at *Donau-eschingen*. Its general course is from west to east, and it flows into the Black Sea by four different outlets, called respectively the *Kilia*, *Stamboul*, *Sulina*, and the *Edrillis* or *St. George's* mouths. The *Sulina* mouth or channel is the deepest. The extent of the basin of the Danube is about 300,000 square miles, and its total length is about 1,875 miles. The Danube basin comprises portions of Austria-Hungary, Germany, Serbia, Bosnia, Rumania, and Bulgaria. From its source it flows northeast to *Ratisbon*, in Bavaria, whence it takes a southeast course, by *Vienna* and *Pressburg*, to *Waitzen*, in Hungary. Here the course is changed to nearly due south to the point where it receives the waters of the *Drave*, near *Esseg*, in Slavonia; thence it flows southeast to *Belgrade*, on the north boundary of Serbia, and for some distance it forms the boundary between Serbia and Austria. The course continues in an easterly direction to *Orsova* (the Iron Gate), where it changes to southeast, then again nearly east, forming for a long distance the boundary line between Rumania and Bulgaria. At *Silistria*, in Bulgaria, it turns more to the north, through Rumania to *Galatz*, then southeast between Rumania and Bessarabia, in Russia, and finally into the Black Sea.

The great basin of the Danube has been divided into four minor basins. The first consists of a vast plateau 1,640 feet above sea-level, 150 miles in length, and 125 miles broad, surrounded by mountains, and comprising a portion of the principality of *Hohenzollern*, part of the kingdom of *Württemberg*, and the greater part of the kingdom of *Bavaria*. This tract is by far the most fertile and most populous through which the Danube passes during its entire career. The principal branches within this space are the *Iser* and *Lech*.

The second basin belongs to the empire of Austria, having *Vienna* nearly in its centre, and comprising the archduchy of Austria, Hungary as far east as *Waitzen*, and *Styria*. It is very irregular, and is bounded by very high moun-

DANUBE NAVIGATION COMMISSION — DANVILLE

tains. The soil is rich in mineral products, and the climate one of the best in Europe. The principal branches in this basin are the March or Morava, and the Enns—the former from the left, and the latter from the right. The Danube here passes through a succession of the most picturesque scenery.

The third basin of the Danube comprises Hungary east of Waitzen, and the principality of Transylvania, and consists of an immense plain, almost without undulations of any kind, and only 394 feet above the sea-level. It is intersected by large rivers with marshy banks, and interspersed with stagnant pools, saline and sandy wastes. It comprises about one half of the entire basin of the Danube. The marshes cover a space of 3,053 square miles. The principal branches in this basin are the Save, the Drave, and the Morava. From Budapest to Belgrade the river passes through an immense plain covered with sand and alluvium, through which it is constantly forming new channels and filling up the former ones. Below Moldava it passes for 60 miles through a succession of rapids and shallows, interspersed with rocks and sandbanks, where it has cut a passage for itself through the cross chain of hills which connect the Carpathian Mountains with the Alps; and between Drenkova in Hungary, and Scala Kladova in Servia, the navigation is partially interrupted by three great rapids, the principal or last and lowest of which is the famous Iron Gate, where the stream rushes through a narrow channel between stupendous rocks, ending with a series of whirlpools, eddies, and smaller falls. By the removal of various obstructions vessels drawing nine feet have long been able to pass at certain seasons; and by works carried out in 1890-6, and extending over some 50 miles, a permanent waterway has been secured.

The fourth basin comprises Rumania, a portion of Bessarabia, and Bulgaria. This tract is flat, inundated, and marshy along the banks of the river; dry and mountainous on the borders of the basin. The principal branches in this basin are the Aluta, Sereth, and Pruth. In the lower part of its course the Danube increases in width from 1,400 to 2,100 yards; and in one part it forms an expanse of water like a sea, and is studded with islands. Excepting between Drenkova and Kladova, the Danube may be said to be navigable for steamers from Ulm to the sea, although in some places navigation is rendered difficult by shallows and sandbanks, intersected by narrow and intricate channels. The outlets of the Danube are separated from each other by several low islands covered with reeds and trees. The greater part of the ships bound up the river enter it by the Sulina mouth. The Danube has 60 navigable tributaries, and its volume of water is nearly equal to that of all the rivers that empty themselves into the Black Sea taken together. Its rapidity is in many places above Orsova so great as to render navigation difficult, but below that point its current is less rapid. A number of steamers now ply on the river between its principal towns. The principal towns on the banks of the Danube are Ulm, in Wurtemberg; Regensburg (Ratisbon) and Passau, in Bavaria; Linz and Vienna, in Austria; Pressburg, Budapest, and Peterward-ein, in Hungary; Belgrade, in Servia; Widin, Nicopolis, Rustchuck, and Silistria, in Bulgaria; Brahamlow and Galatz, in Rumania.

Danube Navigation Commission, an international commission, constituted in 1856, when at the Peace of Paris the navigation of the river was declared free to all nations. It was composed of delegates of all the great powers, to whom a representative of Rumania has been added since 1878. It was appointed on the express condition that it should dissolve in 1858, but such was its usefulness that it was informally continued till 1866, when the Conference of Paris formally prolonged its powers for five years. In 1871 the Conference of London continued the commission for 12 years, and in 1883 a second London conference extended its existence for 21 years. It exercises almost sovereign power on the mouths of the Danube, where it has conducted great engineering works; it has its own flag, uniform, and revenue, and has raised loans, made laws, and maintained its own small army of police. Its jurisdiction, originally limited to the river between Isaktcha and the sea, was extended at the Congress of Berlin (1878) as far as Galatz, and afterward to the Iron Gate; but in the last-named portion of the stream its authority is exercised only by delegation to the Riverain Commission of the states on the bank, or on appeal from its decisions.

Danubian Principalities. See MOLDAVIA; RUMANIA; WALLACHIA.

Danvers, Mass., town in Essex County, on the Boston & Maine Railroad, five miles northwest of Salem. It was a portion of Salem till 1756, and the Salem village parish where the witchcraft excitement broke out is included in the present Danvers. It is the seat of Peabody Institute, founded by George Peabody, a resident of the place, who in 1852 donated \$200,000 for the promotion of knowledge and morality among the inhabitants. It is also the seat of Danvers Insane Asylum, built at a cost of \$2,000,000, and has extensive manufactures of shoes, bricks, and carpets, and has foundries, rolling mills, tanneries, churches, high school, weekly newspapers, public library, a national bank, and good public and private schools. Pop. 8,600.

Danville, Ill., city, county-seat of Vermilion County; on the Vermilion River, and the Wabash, Chicago, and Eastern Illinois, and the Cleveland, Cincinnati, Chicago & St. Louis railroads; 125 miles south of Chicago. It has a National Soldiers' Home for disabled veterans, with over 3,500 inmates. Its chief industry is coal mining, which is carried on extensively on the bluffs of the river. It also has large railroad car and machine shops, iron foundries, planing-mills, carriage and wagon factories, organ and furniture factories as well as churches, a high school, three national banks, daily and weekly newspapers. Pop. (1900) 16,354.

Danville, Ind., county-seat of Hendricks County; situated on the Cleveland, Cincinnati, Chicago & St. Louis Railroad, about 20 miles west of Indianapolis. The manufacture of flour and lumbering are the principal industries. It is the site of the Central Normal College, a private institution. Pop. (1902) 1,802.

Danville, Ky., city, county-seat of Boyle County; on Dick's River, and the Cincinnati Southern Railroad, 42 miles south of Frankfort. It is a stock-raising centre, and the seat of several educational institutions among them

DANVILLE — DAPHNIS

the Danville Theological Seminary, the Southern Collegiate Institute, Center College, the Caldwell Female Institute, and also the State Asylum and School for Deaf-mutes. It has churches, public schools, three national banks and weekly newspapers. Pop. (1900) 4,285.

Danville, Pa., a borough and county-seat of Montour County; on the Susquehanna River; and on the Pennsylvania, the Lackawanna, and the Philadelphia & Reading railroads; 154 miles northwest of Philadelphia. Danville is in a district abounding with iron ore, limestone, and anthracite coal; and contains the first establishment erected in the United States for the manufacture of railroad iron. It still ranks among the most extensive iron manufacturing places in the country. There are blast furnaces, iron foundries, rolling-mills, churches, two national banks, the Danville Institute, a State asylum for the insane, and daily and weekly newspapers. Pop. (1900) 8,042.

Danville, Va., city and county-seat of Pittsylvania County, on the Dan River, 140 miles southeast of Richmond, on the Danville & Western and the Southern R.R.'s. One of the oldest cities in the South; incorporated as a town in 1792. For a short time during the last days of the Southern Confederacy it was the seat of government. It is located in the famous and picturesque Piedmont section of Virginia, on a gradual slope extending from the river to an altitude of 600 feet above the sea. The river furnishes power for the cotton-mills, flour-mills, foundry, ice factory, and electric-light plant; and further development of its water power is now being made about three miles up the river, at an estimated cost of \$2,000,000. Danville is the largest loose tobacco market in the world, her average annual sales being 50,000,000 pounds. The surrounding country is well adapted to grain, fruits, and tobacco. The improvements in public utilities within the past three years include larger water mains in the down-town district (16 inch), and additional fire engines (not including further improvements now under consideration) at a cost of \$23,000; Main street repaved with Belgian block and Mack brick, \$100,000; Craghead street, same material, \$24,500, and several other less important streets paved with cobble. Further extension of the sewerage system from time to time as the growth of the city requires; new electric-light plant owned by city, with new \$5,000 incandescent machine, furnishing lights for streets, business, and dwelling-houses; electric railway system rebuilt at a cost of about \$320,000, first-class equipment, double track on Main street, about eight miles of track, new power-house, with double set of dynamos and engines. The Southern Bell Telephone and Telegraph Company has expended about \$30,000 in improvements, and the growth of their business has been such as to require a much larger additional switchboard, which was installed recently. Danville is the seat of Roanoke Female College (Baptist), established 1859, Randolph Macon Institute for Young Ladies (Methodist), founded in 1883, and Danville Military Institute, established in 1890. The climate of the city is mild and pleasing, the streets well shaded and paved, and as a residential city it is excelled by few locations in the South. There are many new public buildings, churches, and schools; a general hospital recently enlarged and fitted with the latest improvements, seven banks

—one national, five State, and one private, and two daily newspapers. Under the new constitution of the State the municipal government is administered by a mayor, elected quadrennially, and a city council, composed of two branches having different numbers, which controls appointments to most of the administrative offices. The water works, electric light and gas plants are owned and operated by the municipality. Pop. (1890) 10,303; (1900) 16,529.

Danzig. See DANTZIC.

Daphænus, an extinct genus of *Canidae* of the Oligocene Epoch in North America. It has many primitive characters, such as small brain, long tail, short limbs, and five toes on each foot, with somewhat retractile claws. The third upper molar tooth, lost in all modern dogs, was present in *Daphænus*, giving it the complete primitive series of 44 teeth. It is considered to be a nearly direct ancestor of the modern dogs, wolves and foxes. The Carnegie Museum, Pittsburgh, has a complete skeleton from Dakota.

Daphne, a famous grove near Antioch, planted by Seleucus Nicator, who erected a temple there and dedicated it to Apollo and Diana. It was a place of pagan pilgrimage noted for its license, until the spread of Christianity caused its abandonment. A graphic description of this grove is given in 'Ben Hur.' For Daphne in Egypt see TAHPENES.

Daphne, a genus of plants belonging to the *Thymelæacea* or *mezereum* family. The genus has about 40 species, natives of Europe and Asia. The single American species is the spurge or lady laurel (*D. mezereum*), found in northern New England and New York as a fugitive from cultivation. These plants are common in temperate climates in Europe and Asia, and are valuable commercially. From the bast of some species fibres are obtained, and most of the paper used in Central Asia is made from some species of the daphne. The inner bark of *D. lagetta*, when cut into thin pieces after maceration, assumes a beautiful net-like appearance, whence it has received the name of lace-bark. The bark of the spurge-laurel (*D. mezereum*) is used in decoction as a diaphoretic in cutaneous and syphilitic affections. In large doses it is an irritant poison, causing excessive purging. Used externally it acts as a vesicant. It contains a ventral crystalline principle called daphnein. The fruit is poisonous. The barks of *D. gnidium*, *D. alpina*, *D. cneorum*, *D. poncica*, and *D. laureola* have similar properties. The berries of the last are poisonous to all animals except birds.

Daphnepho'ria, one of the most ancient and important of the Greek festivals, observed in honor of Apollo.

Daph'nin, a glucoside having the formula $C_{15}H_{16}O_8$, and occurring in the bark and blossoms of certain species of plants belonging to the genus *Daphne*. It is slightly soluble in cold water, from which it crystallizes in rectangular prisms containing two molecules of water. It is insoluble in ether, but readily dissolves in boiling alcohol. It reduces Fehling's solution slowly, and by the action of emulsin or of dilute acids it is converted into glucose and a substance called daphnetin, or di-oxy-coumarin.

Daphnis, in fabulous history, the son of Hermes (Mercury) by a nymph, educated among the nymphs, and celebrated in the Sicilian traditions as the author of bucolic poetry,

DAPHNIS AND CHLOE—DARBY AND JOAN

and also as a performer on the shepherd's pipe. He pastured his flocks upon Mount Ætna. The nymph Echenais, who loved the youth, threatened him with blindness if he should love another; but being intoxicated with wine by the daughter of a Sicilian prince, he forgot the warning, and thus brought upon himself the threatened punishment. Some say that he died of grief; others that the nymph transformed him into a stone. All the nymphs bewailed his death, and Hermes raised him to the heavens. On the spot where he died flowed a fountain, at which the Sicilians afterward performed yearly sacrifices.

Daphnis (dǎf'nís) and **Chloe**, klō'ē, a pastoral romance written in Greek during the 4th or 5th century of our era and ascribed to Longus. Many English, French, and Italian pastorals were suggested by this work; but the one derived most directly from this source is Saint-Pierre's 'Paul and Virginia.' The scene of the Greek tale is laid in the island of Lesbos. A goat-herd named Lamón finds one of his goats suckling a fine baby boy, and adopts him as his own child, calling him Daphnis, and bringing him up to herd his goats. A neighbor, Dryas, discovers a baby girl nourished by a ewe in the grotto of the nymphs. She is adopted under the name of Chloe. The two young people pasture their herds in common, and are bound by a child-like affection, eventually deepening into love. Daphnis sues for the hand of Chloe. He is accepted by her foster-parents; but the marriage is deferred till the arrival of Lamón's master who proves to be the father of Daphnis. Chloe is identified as the daughter of a wealthy Lesbian. The young people are married with great pomp, but return to their pastoral life, in which they find idyllic happiness.

Dapitan, dā-pē'tān, Philippines, a Spanish province or comandancia in the northwestern part of the island of Mindanao. There are numerous rivers navigable for the native boats, and these are the chief means of communication in the province. Hemp, cotton, sugar, etc., are cultivated for domestic consumption; the forests, particularly the ebony, are valuable. There is some export trade in gums, wax, honey, cacao, etc. Pop. 20,270.

Da Ponte, Lorenzo, lō-rēnd'zō dā pōn'tē, Italian dramatist and author: b. Venice 10 March 1749; d. New York 17 Aug. 1838. He wrote the libretti for Mozart's operas 'Don Giovanni' and 'Figaro.' He came to America in 1805, and in 1828 was professor of Italian in Columbia College. He wrote many plays, sonnets, and translations, and published several works of instruction in the Italian language; also his own 'Life' (1823); 'History of the Florentine Republic and the Medici' (1833).

Darbhāngah, dā-bān'gā, India, (1) a district in Bengal. In the rainy season the district becomes inundated by the overflow of the rivers Kamlā and Little Bāghmati. Area 3,335 square miles; pop. 2,633,477. (2) A town of the same name is the capital of the district. It is situated on the Little Bāghmati, and is the residence of the Maharaja of Darbhāngah. The chief exports are oil-seeds and timber. Pop. 73,561.

D'Arblay, dār-blā (MADAME), **Frances Burney**, English novelist, daughter of Charles Burney: b. King's Lynn, Norfolk, 13 June 1752; d. Bath, England, 6 Jan. 1840. After she had

published 'Evelina, or a Young Lady's Entrance into the World' (1778), she became the favorite of the literary men of the day, especially Dr. Johnson. Her second novel 'Cecilia' (1782) was no less admired. In 1786 she was made second keeper of the robes to Queen Charlotte, and in 1793 was married to M. D'Arblay, a French army officer. Her other books are 'Camilla' (1795), and 'The Wanderer, or Female Difficulties' (1814). Her 'Diary and Letters,' edited by her niece (1842-6), surpass in modern estimation the rest of her writings. The record begins with 'Evelina.' The success of her first effort, the dinings, winings, and compliments that followed, are recorded with a naïve garrulousness perfectly consistent with simplicity and sincerity. She also wrote memoirs of her father (1832). 'Evelina' and 'Cecilia' were published with introductions by Annie R. Ellis (London 1881-2).

Darboy, Georges, zhōrhzh dār-bwā, Archbishop of Paris: b. Fayl-Billot, department Haut of the Commune, 16 Jan. 1813; d. Paris 24 May 1871. He was admitted to the priesthood 1836, and began regular parish work; but in 1839 became professor, first of philosophy, then of dogmatic theology in the ecclesiastical seminary of Langres. Removing to Paris in 1846 he was for a while attached to the College of Henry IV. and was also editor of the journal 'Moniteur Catholique'; in 1854 he was appointed vicar-general of the archbishop of Paris and inspector of religious instruction in the schools of the diocese, that is, superintendent of the Christian doctrine work in the diocese. In 1859 he was consecrated bishop of Nancy, and in 1863 was appointed successor to Archbishop Sibour of Paris, who had been slain by an assassin. In the Vatican Council he was one of the leaders of the minority who opposed the declaration of papal infallibility on the ground that such a declaration was inopportune; but after the definition he was one of the first among its former opponents to make submission. In the siege of Paris by the German armies he won universal approval for his devoted labors in relieving the wounded and succoring the distressed; and when the Communists, known to be his mortal foes, came into control of the city, he refused to seek safety outside the walls. Arrested by the Commune and held as a hostage, he with other hostages was fusilladed to death in the yard of the prison of La Roquette, 4 April 1871. The end came while he was in the attitude of blessing his assassins and invoking forgiveness for them. It was not a mere accident or coincidence that he was the author of a 'Life of St. Thomas à Becket' (1859), that archbishop of Canterbury who was slain by assassins before the high altar of his cathedral church 700 years before; within 23 years he had seen his two nearest predecessors, archbishops of Paris, murdered, one by an individual assassin, the other (Affre) by the insurgent populace. In addition to his scholarly work, 'The Life of St. Thomas à Becket,' he wrote a new translation of 'Dionysius the Areopagite,' and also a translation of the 'Imitation of Christ.'

Darby and Joan, the names of a married couple traditionally reported to have lived in the West Riding of Yorkshire in the 18th century and been remarkable for their long and happy life together. A ballad entitled 'The Happy

Old Couple,' by Henry Woodfall, commemorates their excellencies. Humdrum, uneventful married life is sometimes referred to as a "Darby and Joan" existence.

Darbyites, a name often applied to the Plymouth Brethren (q.v.) from their principal founder, John Nelson Darby (1800-82), of whose collected writings 32 volumes have appeared (1867-83). See his 'Personal Recollections' (1881).

Darbyshire, Alfred, English architect: b. Salford, Lancashire, 1839. He began the practice of his profession in 1862 at Manchester and has designed many buildings of importance there and elsewhere. He has published 'Experiences of an Architect, Professional, Artistic, and Theatrical'; 'A Book of Old Manchester and Salford.' He was art critic of the *Manchester Guardian*, 1868-74, and has acted in a similar capacity for the *Manchester Courier* from 1875 to the present.

Darcet, Felix, fā-lēks dār-sā, French chemist: b. Paris about 1807; d. there 18 Dec. 1846. He was a son of Jean Pierre Darcet (q.v.); studied medicine and became a physician, but paid some attention to chemistry, and published researches on the preparation of hydriodic acid, on the action of iron at a high temperature on benzoic acid and on camphor, on succinic acid, on arsenovinic acid, on chloroethereal.

Darcet, Jean, zhōn, French physician and chemist: b. Douazit 7 Sept. 1725; d. Paris 13 Feb. 1801. He accompanied the celebrated Montesquieu to Paris in 1742, and remained with him till his death as a literary assistant. He afterward devoted himself to chemistry, especially to technical chemistry, was appointed professor of chemistry in the College of France, and regent of the medical faculty. Darcet made many experiments with a view to the improvement of the manufacture of porcelain. He also tried the effect of fire on the various kinds of earths, and demonstrated the volatility of the diamond. In 1776 he published a memoir on the geology of the Pyrenees. He succeeded Macquer as a member of the Academy of Sciences and director of the manufactory of Sèvres. He was afterward appointed inspector-general of the assay of coin and inspector of the Gobelins manufactory. He made several important chemical discoveries, and contributed much to the present improved state of the science. A fusible alloy of lead, bismuth, and tin is named after him.

Darcet, Jean Pierre Joseph, zhōn pē-ār zhō-zef, French chemist: b. Paris 31 Aug. 1777; d. there 2 Aug. 1844. He was a son of Jean Darcet (q.v.). He began his chemical studies early with his father and with Vauquelin. In his 24th year he was made assayer of the mint, and from that time devoted himself chiefly to chemistry in its application to the arts. Being employed by the government in the manufacture of gunpowder, he rendered its preparation much more easy by new processes. He greatly assisted in extending the manufacture of soda artificially, succeeded in producing alum equal in quality to that of Italy, brought the art of stereotyping to greater perfection, facilitated the preparation of sulphuric acid, investigated the best alloys for cannon, for cymbals and tam-tams, and for statues, etc. Among his other discoveries were the extraction of soda

from chestnuts, the preparation of sugar from the same material, and the extraction of jelly from bones by means of an acid. He also made another discovery of great importance, whereby he obtained the prize of 3,000 francs which Ravrio had provided for the discovery of the means of protection against the fine dust of quicksilver, which had been so unhealthy to the gilders. Darcet's discovery completely attained the object.

D'Arcy, Ella, English novelist: b. London. She was educated in France and Germany and has published: 'Monochromes' (1895); 'The Bishop's Dilemma' (1898); 'Modern Instances' (1898).

Dardanelles, dār-da-nēlz' (ancient HELLES-PONT), a narrow channel, in the Turkish dominions, which connects the Sea of Marmora with the Aegean Sea, and separates Europe from Asia. It is about 40 miles in length, varying in breadth from one to four miles. There is always a rapid current in the channel, the volume and velocity of which is much increased by the prevailing winds, which blow in the same direction with the stream for at least 10 months in the year. The modern name of this strait is derived from the castles, called the Dardanelles, built on its banks, at its southwest entrance; its ancient name, Hellespont, from Helle, daughter of Athamas, king of Thebes, who was fabled to have been drowned in it. Xerxes on his great expedition against Greece, in 480 B.C., crossed this strait by means of two bridges of boats, constructed in the neighborhood of Sestos and Abydos. It is also renowned as the scene of the death of Leander, who, it is said, used to swim across from Abydos on the Asiatic side, at the narrowest part of the strait (but yet about a mile in width), to visit Hero of Sestos on the European side. This feat of swimming the channel was also performed by Lord Byron, who achieved it in 1 hour and 10 minutes. To protect Constantinople, coast batteries have been built since 1867, on both the Asiatic and the European side. These batteries have latterly been supplied, in part at least, with ordnance of recent type, such as the guns made by Krupp. In 1770 the Turkish defenses were almost in ruins. Warned by the condition of the batteries when a Russian squadron appeared before the castles, the Turkish government ordered the defenses repaired; but they were again allowed to become almost useless until 1807. In that year a British squadron passed the Dardanelles and appeared before Constantinople, which until then had never seen an enemy's fleet. In 1854, during the Crimean war, the castles and other defenses of Constantinople were again put in repair. It had long been recognized that the Turks had a right to prevent any foreign ship of war from passing the Dardanelles, and in 1841 a treaty was signed between the five great European powers and the Porte, in which it was laid down that this was not to be permitted. The treaty was confirmed in 1856, the Sultan, however, retaining the right to permit certain vessels belonging to foreign governments to pass. By the Berlin treaty of 1878 the duty was again imposed upon the Sultan to prevent the passage of any foreign ship of war.

Dardanus, dār-da-nūs, in mythology, the progenitor of the Trojans, and so of the

DARDISTAN — DARIEN

Romans, and the son of Zeus and Electra, the daughter of Atlas. He emigrated from Samothrace (according to some accounts, from Arcadia, or Crete), and settled in Phrygia, in the country which was afterward called Troas. Here he built a city, which, from him, was called Dardanum, or Dardanus, and introduced the worship of Athena (Minerva).

Dardistan, dār-dīs-tān', the name given to a region of central Asia, bordering on Balistan, the northwest portion of Cashmere. This country, which consists of lofty mountains, is little known, and its limits are variously given; but its interest depends mainly on the fact that its inhabitants, the Dards, are an Aryan people, speaking a Sanskritic tongue mixed with Persian words. They have been called "Stray Aryans in Tibet," and are Moslems converted from Buddhism at a comparatively recent period. The rajah of Cashmere is constantly endeavoring to subject them completely to his authority. The chief districts are Hasora, Gilghit, and Tassin; some authorities also include Chitral in Dardistan.

Dare, Virginia, first child of English parents in the New World: b. Roanoke August 1587, and named after the district of Virginia. She was the granddaughter of John White, who was governor of the colony sent by Sir Walter Raleigh to found an agricultural state, which sailed from Plymouth, 26 April 1587, and reached the shores of Virginia in July of the same year. White's daughter was married to Mr. Dare, who was one of the assistants of the governor, and Virginia was born about a month after the arrival of the expedition.

Darfur, dār'fooor, or **Darfoor** (Country of the Fur, a tribe of negroes), a region of central Africa, occupying a large portion of the area between Abyssinia and Bornou, and forming part of the Egyptian Sudan. It may be considered as lying between lat. 10° and 16° N., and lon. 22° and 28° E.; area, 150,000 square miles. On the east it has Kordofan; on the west, Wadai; on the north, the desert; while the regions to the south are occupied by barbarous nations. The most important physical feature is the Djebel Marrah, a chain of mountains near the centre of the country, of a crescent form, lying north and south and reaching the height of 6,000 feet. Some of the peaks are extinct volcanoes. There are other subordinate chains and elevated masses. There seem to be no permanent streams, the water-courses being filled only temporarily. The country belongs mainly to the Nile basin, partly to that of Lake Chad. Large portions of it are barren or are covered with verdure only in the rainy season. The inhabitants are of various races, some of them of the negro type, others having little of the negro character, and a considerable number being Arabs. The Fur or For, who give name to the country, inhabit the mountainous central parts, and are of a brownish-black color with negro features. Mohammedanism is the religion of the country, and to it is due what little civilization the people possess; but the natives are still semi-barbarous. Their occupation is chiefly agriculture. A few of the mechanical arts are carried on, and in particular the people manufacture a considerable variety of articles, including cotton goods, pottery, leather, lance-heads, etc. Their houses are rudely constructed

of clay and reeds, and with scanty accommodation. Among the exports the most important are camels, ivory, the horns, teeth, and hide of the rhinoceros and hippopotamus, ostrich feathers, gum, and copper. The imports comprise beads, glass, arms, light cloths of different kinds, silks, shoes, and other manufactured articles. Darfur was an independent kingdom till annexed by Egypt in 1874. During the ascendancy of the Mahdi and his successor it was independent; but it is now recognized as within the "sphere of influence" of Great Britain. The capital is El Fasher. Pop. 4,000,000.

D'Argenson, Marc Pierre, mārċ pē-ār dār-zhān-sōn, Comte, French statesman: b. 1696; d. Paris 1764. He was the younger son of the Marquis d'Argenson (1652-1721), who created the secret police and established the *lettres de cachet*. He became war minister in 1743, at a time when the very political existence of France was imperiled, and by his vigor and lucky choice of generals changed the fortunes of the war in the course of a single year. After the peace of Aix-la-Chapelle (1748), he devoted himself to the improvement of the military system, and in 1751 established the *Ecole Militaire*. He was an illustrious patron of literature. Diderot and D'Alembert dedicated to him their great 'Encyclopédie'; and to Voltaire, whose fellow-student he had been, he furnished materials for his 'Siècle de Louis XIV.' In 1757 he was banished to his estate by the machinations of Madame Pompadour; but on her death he returned to Paris.

Dargomyzhsky, dār-gō-mīzh'skē, or **Dargomijsky**, Alexander Sergievitch, Russian composer: b. village of government of Toula, 2 Feb. 1813; d. St. Petersburg 29 Jan. 1869. He composed the music for the libretto of 'Esmeralda,' which Victor Hugo wrote for Louise Bertin, many piano pieces, 100 romances, airs, and duets for the voice, symphonic and choral fantasies and a "cantata-ballet," called 'The Festival of Bacchus,' besides the opera of 'La Roussalka,' his happiest effort, given at St. Petersburg in 1856. After this he tried to form a new school, dying before the completion of his opera, 'The Guest of Peter,' which was finished by friends and given in 1872 without much success.

Daric, dār'ik, properly **Daricus** (Gr. *δαρείος*), an ancient Persian coin of pure gold, specimens of which are still preserved in several European collections, bearing on one side the image of a kneeling archer, on the other that of a royal palla. It was known to the Greeks, Romans, and Jews; the latter used it after the Babylonian captivity, under the reign of the Persians, and called it *adarkon* or *darke-mon* (mentioned in the first book of Chronicles, by Esdras and Nehemiah). Its value was equal to 20 silver drachmæ, or 16 shillings 3 pence; 3,000 being equal (according to Xenophon) to 10 talents. Its name is variously derived from that of King Darius Hystaspes, who regulated the Persian currency, and from several Persian words meaning king, palace, and bow. The so-called silver darics were not designated by this name in antiquity.

Darien, dā'rī-ən, Ga., city, county-seat of McIntosh County; on the Altamaha River, and the Darien & Western Railroad; about 65 miles southwest of Savannah, and about 10 miles

DARIEN — DARIEN SCHEME

from the ocean. Lumber, rice, and vegetables are sent from here to the markets along the coast. Pop. 2,000.

Darien, dā'rī-ən, Sp. dā-rē-ān', **The Colony of**, established by the Spaniards on the Gulf of Urabá (See **GULF OF DARIEN**), in the first decade of the 16th century, was the centre from which exploring expeditions were sent out until Panamá was founded in 1519. A notary of Triana, named Bastidas, sailed along the Caribbean coast of the isthmus in 1501, Balboa being one of his companions. At the end of 1502 and beginning of 1503 Columbus carefully examined the region immediately west of this gulf. In 1508 the king granted to Nicuesa the territory from the Gulf of Darien to Cape Gracias á Dios; to Ojeda, the territory from the Gulf of Darien to Cape de la Vela. The dividing line was more precisely fixed by the grantees, who agreed that it should be the Atrato River. (See **DARIEN, GULF OF**.) In the event the only permanent settlements were made near this river and the gulf into which it flows. Ojeda first landed at Cartagena (1509), where his expedition endured great hardships. Removing thence to the eastern side of the Gulf of Urabá, he built the fort called San Sebastian, which he entrusted to Francisco Pizarro, and then returned to the West Indies. Pizarro, Balboa, and all who remained alive set sail for Cartagena once more. There they were met by Enciso, with re-enforcements from San Domingo, and after some hesitation, crossed the gulf to the western shore, where the colony of Santa Maria de la Antigua del Darien was established in 1510. Balboa gained ascendancy by recommending the selection of this place (which he had visited with Bastidas), and became the leading spirit in the undertakings which followed—the expedition to Dabaiba, the crossing of the isthmus, etc. (see **BALBOA**).

Nicuesa's expedition, though it started under brighter auspices, resulted in a lamentable failure. Its courtly leader, after losing nearly all his followers near Cape Nombre de Dios, was forced to put to sea in a boat that could not outlive a single storm—practically condemned to death by the authorities at Darien, whom he had offended. In 1514 Pedrarias Davila superseded Balboa as governor. Five years later Panamá was founded; the capital was established on the Pacific coast; exploration northward and southward began along the shores of the newly discovered ocean; the isthmian traffic sought and found an easier route, better harbors, and a less deadly climate at a distance from the Gulf of Urabá. Darien was abandoned. See **CENTRAL AMERICA**; **SOUTH AMERICA**.

Darien, Gulf of, also called **The Gulf of Urabá**, an extension of the Caribbean Sea forming a wedge-shaped indentation in the northern coast of Colombia; of great width between Colón and Cartagena, but narrowing toward the south until it becomes an estuary of the Atrato River. A distinction to be commended on the ground of convenience is that which would restrict the name Urabá to the southern portion, which is about 7 miles wide by 30 long. Some of the earliest Spanish settlements, at the beginning of the 16th century, were located on the Gulf of Urabá (see **DARIEN, THE COLONY OF**); the region has not prospered, however, owing to the lack of good

harbors; to the extremely unhealthful, hot, and damp climate of the coast at this point; and the diversion of isthmian traffic to Colón and Parana.

Darien, Isthmus of, the neck of land uniting South and Central America; more specifically, the lower portion which is narrowed between the gulfs of Urabá and San Miguel, while its prolongation on the northwest, between the Caribbean Sea and the Gulf of Panamá, is called the Isthmus of Panamá. It is traversed by the Cordillera de Baudó. Its principal rivers are the Tuira (also called Darien), which rises in the heights of Aspaves, receives the waters of a number of tributaries, and flows into the Gulf of San Miguel, and the Atrato, which comes out of the department of Cauca and empties into the Gulf of Urabá. In regard to the climate on the coast, see **DARIEN, GULF OF**. A Colombian official publication says: "The interior of the Isthmus of Darien is very sickly, and only the negroes and Indian half-breeds can stand its excessively rainy climate, hot and damp, and its atmosphere, which the marshes make malarious. Though about the Darien cordillera the temperature is milder, it cannot be said that the region is salubrious; and it will never be until the great woods and groves shall have disappeared." The woods in question, especially in South Darien, are of excellent quality and colossal growth, constituting a source of wealth. Gold is obtained from the rivers Balsas and Marca, and the mines of Cana or Espiritu Santo, near the Tuira River, were famous in the old days. For other natural resources, etc., see **PANAMÁ, DEPARTMENT OF**; for historical sketch, see **DARIEN, THE COLONY**.

Darien River, the name sometimes given to two streams in the Republic of Colombia: (1) A river emptying into the Gulf of Urabá, on the banks of which Balboa and others founded in 1510 the town of Antigua del Darien (see **DARIEN, THE COLONY**); (2) the Tuira River (see **DARIEN, ISTHMUS OF**).

Darien Scheme, a celebrated financial project, conceived and set afloat by William Paterson, a Scotchman, toward the close of the 17th century. It is said that he was originally a buccaneer, that he was a clergyman, and that he was a merchant; the probabilities are on the side of the last assertion, as he possessed a wide knowledge of commerce and finance. He was undoubtedly a man of an original mind, and of a bold and enterprising disposition. He was the first projector of the Bank of England, and being defrauded of his just recompense by those who adopted his plans, he resolved to confine his future schemes to the benefit of his native country. On his original and ostensible design of establishing an East India trade in Scotland, he ingrafted the secret and magnificent plan of forming an emporium on each side of the Isthmus of Darien or Panama, for the trade of the opposite continents. According to his idea, the manufactures of Europe were to be sent to the Gulf of Darien, and thence conveyed by land across the ridge of mountains that intersect the isthmus, where they were to be exchanged for the produce of South America and of Asia; and thus, to use his own emphatic language, he would wrest the keys of the world from Spain. In order to attract encouragement and support, he proposed to render his settlement a free port,

and to banish all distinction of party, religion, or nation. But Scotland was at this time very poor; and Paterson went to London to procure subscriptions, which soon ran up to the amount of \$1,500,000. But alarm, first excited by the East India Company and the West India merchants, soon spread over the whole English nation. Even the Parliament addressed King William, in an address remarkable for narrow and illiberal views; and the king, who could ill afford to quarrel with both the English houses of Parliament, nor compromise himself at this juncture with Spain, replied to the address in terms which were interpreted as disfavorable to the scheme, and the English subscriptions were withdrawn. But Paterson himself was not to be easily intimidated; and Scotland, indignant at the opposition which the plan had met with in England, avowedly because it would be beneficial to the Scotch, immediately subscribed \$2,000,000, although at that time there was not above \$4,000,000 of cash in the kingdom. Only a little more than the half of the subscriptions, however, was ever paid up. Such was the national enthusiasm, that young women threw their little fortunes into the stock, and widows sold their jointures to get the command of money for the same purpose. Besides this sum, \$1,500,000 was subscribed at Hamburg, which, however, was withdrawn, in consequence of the threatening memorial presented by the English resident to the senate of that city. The Scotch, nevertheless, persisted in their scheme: five large vessels, laden with merchandise, military stores, and provisions, with a colony of 1,200 persons, sailed for the Isthmus of Darien, which they reached after a voyage of about four months.

The settlement was very judiciously formed at Acta, a place at an equal distance between Porto Bello and Cartagena. Here is a secure and capacious harbor, formed by a peninsula, which the colonists fortified and named Fort St. Andrew. To the settlement they gave the name of New Caledonia. Of the 1,200 persons who had embarked 300 were gentlemen, unaccustomed to labor, fatigue, or homely fare, and totally unacquainted with any of those arts which are indispensably necessary in a new colony. These consequently were of little use; and even the peasants, habituated to a cold climate, were unequal to the fatigue of clearing the ground under a burning tropical sun. In addition to these untoward circumstances, their provisions were either improper for the climate or soon exhausted. The cargoes of merchandise which they sent to the West India islands were not properly adapted for that market. The infant colony was attacked by the Spaniards, and proclamations were issued at Jamaica, Barbadoes, and in the American plantations, prohibiting all succor or access to the Scotch at Darien, on the pretense that their settlement there was an infringement of the alliance between England and Spain. For eight months the colony bore up against these accumulated misfortunes and persecutions; but at the end of this period those who survived were compelled, by disease and famine, to abandon their settlement and return to Europe.

Before this circumstance was known, two other expeditions sailed from Scotland; and the information of the abandonment of the first colony only served to arouse the Scotch nation to more determined perseverance in the plan.

When the second expedition arrived, they found the huts burned and the forts demolished; famine and disease assailed them; they were attacked by the Spaniards from Panama, these they repulsed; but a larger force coming from Cartagena obliged them to capitulate, on condition that they should embark with their effects for Europe; few, however, of these or the other two colonies survived to return to Scotland.

The people of Scotland were indignant at this utter and irremediable failure. They endeavored to extort from William an acknowledgment of the national right to Darien; and failing in this, they presented an address to him to assemble the Scotch Parliament; when it did assemble, a resolution to assert the national right to their colony was only prevented by adjournment, and ultimately by proroguing the Parliament; it was, however, soon necessary to reassemble and mollify it in order to get the supplies for the army; and when it did meet again, some very popular and spirited resolutions were adopted on this subject. The Scotch nation were never afterward thoroughly reconciled to King William, and even for many years subsequent to his death, the remembrance of the loss of Darien was preserved with resentment and regret. In this scheme many families were reduced to ruin, and few had escaped without the loss of a relative or friend. Paterson, on his passage home, after the ruin of the first colony, was seized with lunacy, from which, however, he recovered. He lived many years after, pitied, respected, and neglected. In order to pave the way for a better understanding between the two countries, the lords commissioners for England agreed in 1706 to purchase the shares of the particular members of the Darien Company. A full account of the Darien expedition is to be found in the second volume of Sir John Dalrymple's 'Memoirs of Great Britain and Ireland.' The best recent authority on the subject is John Hill Burton (see his 'History of Scotland' and his 'Darien Papers'). See also Sir Walter Scott's 'Tales of a Grandfather' for a most interesting but rather one-sided narrative.

Da Rimini, Francesca, frän-chēs'kā dā-rē'-mē-nē, an Italian lady of the 13th century, the daughter of Guido da Polenta of Ravenna. She was married to Giovanni Malatesta da Rimini, a cripple, but loved his brother Paolo. Giovanni surprised the lovers at one of their meetings, and killed them both (about 1285). Their story is told in Dante's 'Inferno,' and is the subject of Leigh Hunt's poem, 'The Story of Rimini,' and of the dramas, 'Francesca da Rimini,' by D'Annunzio, and 'Paolo and Francesca,' by Stephen Phillips.

Darius, da-rī'ūs, the name of several Persian kings, or, according to some writers, the royal title itself. Among the most distinguished individuals of this name are:

1. **DARIUS**, fourth king of Persia: d. 485 B.C. He joined the conspiracy against the False Smerdis, who had possessed himself of the Persian throne. After the conspirators had succeeded in getting rid of the usurper, they agreed to meet early the next morning, on horseback, and to appoint him king whose horse should neigh first after sunrise. The groom of Darius, apprised of this project, led his master's horse in the night with a mare to the appointed place, and, in consequence of this stratagem, the horse

DARJEELING — DARK CONTINENT

of Darius neighed first the next morning. Darius was therefore saluted king, and the nation approved the choice. His reign was marked by many important events. The city of Babylon revolted, partly on account of burdensome impositions of tribute, and partly because the royal residence, under Cyrus, had been transferred thence to Susa. Darius besieged the city nearly two years without success, and was on the point of abandoning the siege when Zopyrus, one of his generals, by a heroic sacrifice, placed the city in his possession. After the subjection of Babylon Darius undertook an expedition, with an army of 700,000 men, against the Scythians on the Danube, who enticed him so far into their inhospitable country by their pretended flight, that he succeeded with difficulty in extricating himself and his army, after suffering great losses. Leaving a part of his forces under the command of Megabyzus in Thrace, to conquer that country and Macedonia, he returned with the remainder to Asia, to recruit at Sardis. In the year 501 B.C. a disturbance at Naxos, in which the Persians had taken part, occasioned a revolt of the Ionian cities, which the Athenians endeavored to promote, but which was suppressed by the capture and punishment of Miletus in 496. To revenge himself upon the Athenians, Darius sent Mardonius with an army, by the way of Thrace and Macedonia, against Greece, and prepared a fleet to make a descent upon its coasts. But his ships were scattered and destroyed by a storm in doubling Mount Athos, and the army was almost entirely cut to pieces by the Thracians. Darius, however, collected another army of 500,000 men, and fitted out a second fleet of 600 ships. Naxos was conquered, and Eretria, in Euboea, sacked. Thence the army under Datis and Artaphernes proceeded to Attica, and was led by Hippas to the plains of Marathon. The Athenians had in vain besought assistance from their neighbors, and were obliged to depend upon their own resources alone. They marched forth, 10,000 strong, under the command of Miltiades, to meet the Persian army, and animated by the reflection that they were fighting for freedom and their country, obtained a complete victory (490 B.C.). This prince did much to improve the internal administration of his kingdom. In the year 508 B.C. he sent his admiral, Scylax, to explore the river Indus, and he encouraged commerce and arts by useful institutions and laws.

2. **DARIUS II.**, king of Persia (surnamed Nothos, or the Bastard, by the Greeks): d. 404 B.C. He was an illegitimate son of Artaxerxes I. (Longimanus). He ascended the throne in 423, and suppressed several rebellions of his satraps; but Amyrtæus succeeded in maintaining himself in independent possession of Egypt, which had revolted in 414. His son Cyrus is familiar to us through Xenophon's 'Anabasis.'

3. **DARIUS III.**, king of Persia (surnamed Codomannus). He was the great-grandson of Darius II., and the 12th and last king of Persia. He ascended the throne 336 B.C., when the kingdom had been weakened by luxury and the tyranny of the satraps under his predecessors, and could not resist the attacks of a powerful invader. Such was Alexander of Macedon; and the army sent against him by Darius was totally routed on the banks of the Granicus, in Asia Minor. Darius then advanced with 400,000 soldiers, to the plains

of Mesopotamia. The Grecian mercenaries advised him to await the enemy here, as the level country would enable him to draw out his outforces to advantage; but Darius hastened forward to meet Alexander in the mountainous Cilicia. Darius was a second time totally routed, near the Issus 333 B.C. He himself escaped, under cover of the night, to the mountains. His mother, his wife, and three of his children fell into the hands of the conqueror, who treated them with great generosity. Darius was so far from being discouraged by these defeats that he wrote a haughty letter to Alexander, in which he offered him a ransom for the prisoners, and invited him to a new engagement, or, if he did not choose that, granted him permission to retire into Macedonia. Alexander then laid siege to Tyre, on which Darius wrote him another letter, offering him not only the title of king, which he had before refused to do, but also 10,000 talents ransom, and all the countries of Asia as far as the Euphrates, together with his daughter, Statira, in marriage. These propositions, however, were unavailing. Alexander subjected Egypt, and the two armies met between Arbela and Gaugamela, and after a bloody engagement Darius was compelled to seek safety in flight (331 B.C.). Alexander took possession of his capital, Susa, captured Persepolis, and reduced all Persia. Darius fled to the northern provinces, where he was seized by Bessus, one of his satraps, and afterward murdered.

Darjeeling, dār-jēl'ing, **Darjiling**, or **Dorjiling** (the diamond thunderbolt land), (1) a district of India, in the extreme north of the province of Bengal; area 1,234 square miles. It lies on the southern slope of the Himalayas, and consists partly of mountain and valley, partly of a *terai* or marshy strip below the mountains, some of which are over 10,000 feet high. Coffee, cinchona, rice, and cotton are raised, and the cultivation of the tea-plant is rapidly extending; about 65,000 acres are now in tea plantations. Pop. (1891) 233,314. (2) The chief town in this district is Darjeeling, a celebrated sanatory station, and for several months of the year the residence of the lieutenant-governor and his staff. The Darjeeling & Himalayan Railroad connects it with Calcutta. Pop. 13,037.

Dark Ages, **The**, a period supposed to extend from the fall of the Roman empire, 475 A.D., to the revival of literature on the discovery of the Pandects at Amalfi in 1137. Not to draw the limits too finely, say 700 years (450 to 1150). The Middle Ages may be extended to about 1550, covering from 10 to 11 centuries.

Dark and Bloody Ground, **The**, a name frequently applied to the State of Kentucky. It is said to be a translation of the Indian words "Kain-tuk-ee," though some authorities claim that they signify "At the head of the river." The epithet was originally bestowed because the region was the scene of many sanguinary conflicts between the redmen of the northern and southern tribes. Later the constant feuds between white settlers and the aborigines rendered the phrase peculiarly appropriate to this locality.

Dark Continent, **The**, Africa, in allusion to the almost total ignorance concerning the people and geography of its interior which until quite recently prevailed in Europe and America. See AFRICA.

DARJEELING, INDIA, SHOWING THE HIMALAYA MOUNTAINS.

DARK DAY — DARLING

Dark Day, a name frequently used in this country in connection with 12 May 1780, but applied also to days on which similar phenomena have been discerned. On the date mentioned the atmosphere in New England was so obscured as to cause in some places cessation from outdoor labor. Birds and domestic fowls acted as during an eclipse. The darkness began at 10 and lasted until night, causing a feeling of alarm by its unprecedented nature. There appears to have been an absence of clouds for the most part, though light rain occurred. Though known as the Black Friday of New England, the area covered by darkness also extended west of that section.

Two dark days are recorded as occurring in America earlier than the Black Friday, one in 1716 and another in 1762. The Dark Days of Canada were 16 Oct. 1785 and 3 July 1814. On the latter date the darkness extended over a tract estimated to be about 300 miles in length and 200 in breadth, in the region of the Saint Lawrence River and Gulf. There were showers of sand and very dark ashes and the atmosphere was of a deep yellow color. The characteristic features seemed to point to volcanic action as an origin rather than to forest fires. These two causes have in recent years received much attention in their relation to the obscuring and tinting of the atmosphere over immense areas. The smoke from great forest fires in the northwestern States and in Canada was in 1881 carried south or southeast to almost incredible distances and in June 1903 extensive fires in the forests of New England and of the Adirondacks caused a yellowish haze that extended far from its source. After the volcanic eruptions of Mount Soufrière and Mount Pelée in May 1902 vast quantities of volcanic dust were borne seaward, more or less obscuring the daylight by their persistence in the atmosphere. The volcanic dust from Krakatoa is believed to have encircled the entire earth and to have affected the color of the atmosphere for months. In countries situated like Egypt a marked obscuration of daylight may often be accounted for by the fine sand brought by winds from the desert.

Dark Horse, a phrase used in racing concerning a horse when its power of performance or chances of success are not generally known. The expression has been transferred to fields of human competition, and is frequently used in politics, especially in reference to candidates for nomination in a convention, when they are unexpectedly brought forward or draw a following that had not been anticipated.

Darke, William, American soldier: b. Pennsylvania 1736; d. Jefferson County, Va., 26 Nov. 1801. At 19 he served with the Virginians in the battle of Braddock's defeat, and afterward in the war of the American Revolution. At Saint Clair's defeat he commanded the left wing of the army, and made two gallant and successful charges with the bayonet, in the second of which his youngest son, Capt. Joseph Darke, fell mortally wounded (4 Nov. 1791). His father paused but a moment over him, and rushed with redoubled energy into the conflict. He was repeatedly a member of the Virginia legislature, and, as member of the convention of 1788, voted for the Federal Constitution.

Darlaston, England, town in Staffordshire, included in the parliamentary borough of Wednesbury. It is an irregular, straggling place, engaged in the manufacture of iron for bridges, roofing, and railroads, and gunlocks, bolts, bars, screws, etc. Pop. (1901) 15,391.

Darley, Felix Octavius Carr, American artist: b. Philadelphia, Pa., 23 June 1822; d. Claymont, Del., 27 March 1888. His illustrations of literary masterpieces gave pleasure to thousands, and made him famous. His best work comprises his drawings to accompany the text of 'Rip Van Winkle'; 'Sleepy Hollow'; 'Courtship of Miles Standish'; 'Scarlet Letter'; 'Evangeline'; the novels of Cooper, Dickens, and others, besides many special pictures. His book 'Sketches Abroad with Pen and Pencil' (1868) is well known.

Darley, George, English poet: b. Dublin 1785; d. London 1849. He was graduated at Trinity College, Dublin, in 1811, went to London in 1825, and became attached to the 'Literary Gazette' and 'Athenæum' journals, in which his criticisms of poetry and the fine arts made him well known. He is the author of the 'Labors of Idleness'; 'Sylvia' (1822), and miscellaneous works of a mingled philosophical and poetic character.

Darling, Flora Adams, American novelist: b. Lancaster, N. H., 1840. She married Edward Darling, a Confederate officer, killed in the Civil War. She was one of the founders of the society of Daughters of the Revolution and has been prominent in that and other patriotic organizations. She has published: 'A Wayward, Winning Woman' (1890); 'Was it a Just Verdict?' (1890); 'The Bourbon Lily'; 'Mrs. Darling's Letters, or Memories of the War' (1894); 'A Social Diplomat' (1898); 'History D. A. R. and D. R. Societies of Patriotic Organizations' (1901); 'The Senator's Daughter,' etc.

Darling, Grace Horsley, English heroine: b. Bamborough, England, 24 Nov. 1815; d. 20 Oct. 1842. She was the daughter of the keeper of the Longstone Lighthouse. The event which made her famous occurred on 6 Sept. 1838. The steamer Forfarshire was wrecked near the lighthouse, and at daylight William Darling descried the wreck from Longstone, but accustomed to scenes of danger as he was, shrank from attempting to reach the wreck through a boiling sea in a boat. His daughter, who could see, by the aid of a glass, the sufferers clinging to the wreck, implored him to let her accompany him in the endeavor to relieve them. At last he consented; and father and daughter reached the wreck, and found nine sufferers, whom they succeeded in bringing to the lighthouse. The news of the heroic deed soon spread, and a purse of \$3,500 was quickly subscribed and presented to the brave girl.

Darling (so called from a governor of New South Wales), a name of several applications in Australia. (1) The Darling River, a river rising in the northeast of New South Wales, is formed by the junction of several streams, and flows in a southwesterly and southerly direction till it joins the Murray at Wentworth. (2) Darling district is a pastoral district about 50,000 square miles in extent, in the southwest of New South Wales, and watered

DARLINGTON — DARNLEY

by the Darling and the Murray. (3) The Darling Downs are a rich table-land west of Brisbane in Queensland, forming excellent pasture and arable land. It is well watered, and measures about 6,000 square miles. (4) The Darling Range, granite mountains in western Australia, running in a northerly direction parallel with the coast from Point D'Entrecasteaux for nearly 300 miles. Its highest peaks do not exceed 1,500 feet in height.

Darlington, William, American botanist: b. Birmingham, Pa., 28 April 1782; d. Westchester, Pa., 23 April 1863. He was a soldier in the War of 1812, and a member of Congress 1815-17, and 1819-23. He published a descriptive catalogue of plants in Pennsylvania: 'Flora Cestricea' (1837-53); 'Mutual Influence of Habits and Disease' (1804); 'Agricultural Botany' (1847); and in 1853 a genus of pitcher-plant found in California was named in his honor, *Darlingtonia Californica*.

Darlington, England, a municipal and parliamentary borough in Durham County. It is well built, chiefly of brick, and nearly in the form of a square, and has among its public buildings an ancient Gothic church with a lofty spire, founded in 1160, restored in 1865; corporation buildings, with a handsome clock-tower; market-house, hospital, an infirmary, a technical college, mechanics' institute and library, a grammar-school, a girls' training college, etc. A free library was established in 1885. The woolen manufacture is carried on to a considerable extent, and there are large manufactories of iron, steel, locomotives, materials for bridges and railroads. The town is on the Stockton & Darlington Railroad (now part of the North Eastern system) which was the first line in England on which locomotive steam-engines were used. Pop. (1901) 44,496.

Darlington, S. C., town, county-seat of Darlington County, on the Atlantic Coast Line Railroad, about 80 miles northeast of Columbia. It is in an agricultural region, and is a trade centre for tobacco, cotton, corn, and other products. The manufactures are chiefly cotton goods, tobacco, and fertilizers. Pop. (1902) 3,652.

Darlingtonia, a genus of pitcher-plants, belonging to the order *Sarraceniacæ* (sarraceniads). The *D. californica* grows in the northern part of California, chiefly in the district around Mount Shasta. It is found in boggy places on the slopes of mountains. It entraps insects, which are attracted to the curious pitcher or hood at the extremity of the tubular leaves; and, once inside, are prevented by the fine hairs which point downward from returning. Sometimes the leaf-stems at their base are filled to the depth of four or five inches with insect remains. The larva of a small moth *Xanthoptera semicrocca*, preys on the plant, and that of a dipterous insect, *Sarcophaga sarracenice*, feeds on the dead insects which it encloses. See CARNIVOROUS PLANTS.

Darmesteter, Agnes Mary Frances Robinson, English poet: b. Leamington, England, 27 Feb. 1857. She has attained great proficiency in Greek studies, her verse showing the influence of Hellenic literature. In 1888 she married James Darmesteter (q.v.), the Orientalist, who died in 1894, and in 1901 she married Emile Duclaux, director of the Pasteur Institute in

Paris. Her writings include: 'A Handful of Honeysuckle' (1878); 'The Crowned Hippolytus, from Euripides' (1881); 'Arden,' a novel (1883); 'Emily Brontë' (1883); 'The New Arcadia and Other Poems' (1884); 'Margaret of Angoulême, Queen of Navarre' (1885); 'An Italian Garden' (1886); 'The End of the Middle Ages: Essays and Questions in History' (1888); 'Songs, Ballads and a Garden Play' (1888); 'Lyrics' (1891); 'Retrospect' (1893); 'Life of Renan' (1897); 'A Mediæval Garland' (1897); 'Collected Poems' (1901); and in French, 'Marguerites du Temps Passé' (1892); 'Froissart' (1897); 'Grands Ecrivains d'Outremanche' (1901).

Darmesteter, dār - mē - stē - tār, James, French Orientalist: b. Château-Salins, 28 March 1849; d. Maisons-Lafitte, near Paris, 19 Oct. 1894. Besides works of strict scholarship on the Oriental literatures, as 'Ormazd and Ahri-man' (1877); 'Iranian Studies' (1883); 'Origins of Persian Poetry,' he wrote many essays on miscellaneous subjects. There is an English translation of some of his 'Selected Essays.' He translated with Mills the 'Zend-Avesta' for the 'Sacred Books of the East' series, published by the University of Oxford and edited by Max Müller.

Darmstadt, därm'stāt, Germany, capital of the Grand duchy of Hesse, near the Darm River, 15 miles south of Frankfurt. It consists of an old and a new town. The former, which is the business part of the town, is very poorly built; the houses are old, and the streets narrow and gloomy. The new town is laid out with great regularity, and has handsome squares and houses. Among the remarkable buildings are the old palace (with a library of 500,000 volumes and 4,000 MSS., a picture gallery, and a rich museum of natural history), the Roman Catholic Church, patterned after the Pantheon, the Stadtkirche, and the Rathaus, or town-hall, built in 1580. Darmstadt has some iron foundries, breweries, and other manufactures, and its industries are increasing, but it depends more upon the residence of the court than upon either trade or manufactures. It owns its own electric and gas plants, and its schools and charitable institutions are numerous for its population. Justus von Liebig, the scientist, was born here in 1803. Pop. (1900) 72,381.

Dar'nel, the popular name for *Lolium tenuilentum*, which some suppose to be the *Infelix lolium* of Virgil and the *Zizania* (tarcs) of Scripture. It is believed by the ancients to be poisonous and narcotic. It is common in waste places and fields in America from New Brunswick to Georgia and northward to Michigan. It is remarkably abundant on the Pacific Coast and is generally a troublesome weed. It has been naturalized from Europe.

Darnley, Henry Stuart, Lord, husband of the Scottish queen, Mary Stuart: b. England 1546; d. Edinburgh 10 Feb. 1567. His father, the Earl of Lennox, was descended from a branch of the house of Stuart; his mother, Margaret Douglas, was the daughter of Margaret of England, sister of Henry VIII. Darnley, though devoid of real merit, had, by his personal attractions, won Mary's heart, but it was an unfortunate match; and ere long gave rise first to coolness, then to open quarrel, and finally to deadly hate. Darnley thought, or affected to

think, that her regard for David Rizzio was of a kind which no husband ought to tolerate, and leagued with a body of conspirators, who, on 9 March 1566 dragged Rizzio from the queen's presence, and murdered him under circumstances of horrid barbarity. About the end of that year Darnley was seized with smallpox. In January Mary had him conveyed to an isolated house called Kirk of Field, which stood at some distance from Holyrood. This dwelling, which belonged to a retainer of Bothwell's, the rapidly rising favorite, was blown into the air with gunpowder. The dead bodies of the king and his page were found in a field at a distance of 80 yards from the house, quite free from any mark which such an explosion would cause. Previous to this tragedy a son had been born of the marriage, who afterward united the Scotch and English crowns under the name and title of James I. of England and VI. of Scotland.

Darrow, Clarence S., American lawyer: b. Kinsman, Ohio, 18 April 1857. He was admitted to the bar in 1875, and for some time filled the position of attorney for the Northwestern Railroad Company. He has been very prominent in legal practice, and been retained in many cases against monopoly, as for example in the case against the Gas Trust in Chicago. He is an active politician, being identified with the Independent Democrats. He has written a volume of essays, entitled 'The Persian Pearl,' and many brochures on topics relating to political economy and the social structure.

Dart, a javelin, a short missile weapon thrown by the hand, or impelled by the breath, through a tube. Dart-heads are usually made of iron, but among savage nations flints, sea-shells, fish-bones, and other hard substances have been employed; and among some of the aboriginal inhabitants of the United States and Africa, the dart was merely a sharp-pointed stick, the end of which was carbonized by fire. The weapon is always very simple in its construction, and is usually from three to five feet long.

Darter, a name given to water birds of a small family (*Plotidae*), found in the southern United States, in Africa, Asia, and Australia. The American species (*Anhinga anhinga*), also called the snake-bird and water-turkey, is especially common in Florida, and extends northward to North Carolina and Illinois. In appearance and habits the darter resembles the cormorant, especially in the structure of the feet, wings, and tail; the bill and neck are like those of the heron, the neck, owing to a peculiar anatomical mechanism, being remarkably flexible. The general color of the body is dark glossy green with silvery gray markings; wings and tail, bluish-black. The tail is rather long and consists of 12 narrowly wedge-shaped quills. Their haunts are in low swampy localities, by the side of murky streams. They generally perch on trees whose branches dip into the water. They are the best fresh-water divers known, and drop into the water with such surprising skill that the large body makes scarcely any noise, and but little ripple on entering the water. When swimming, its body is submerged, and the only part visible is the long neck, writhing about like an aquatic serpent, from which peculiarity its name of snake-bird. Its food consists of small fish, shrimps, young reptiles, leeches, etc. The quantity of fish it can

consume is enormous; but like other bird feeding on fish and flesh, it can remain several days without food with impunity. It captures fish, not by diving upon them from above, but by pursuing them under water and spearing them with its closed beak. A bulky nest of sticks, roots, etc., is placed in a tree and receives three or four white chalky eggs.

Darters, small fresh-water fishes forming a sub-family of the *Percidæ* (q.v.), from the typical members of which they are distinguished by having the pseudobranchiæ (opercular gills) imperfect or absent, the margin of the gill-cover smooth, the skull less perfectly ossified, etc. They have been described as perches reduced in size and compacted. The *Etheostomatinae* are peculiar to North America, where 15 genera and about 80 species occur, mostly in rocky rills and clear mountain brooks too small to be occupied by other fishes. They are among the smallest of fishes, some of the species being less than two inches, and the largest—the so-called log-perch (*Percina caprodes*) of the Great Lake region and Mississippi Valley, only six to eight inches long. The typical and largest genus is *Etheostoma*.

The darters spend most of their time resting on their fins on the bottom, hiding beneath stones, or burying themselves in the sand, leaving only the eyes uncovered. Owing to the protective resemblance of their markings to the bottom, they are difficult to distinguish. When disturbed, most of the species dart for a short distance with the greatest rapidity, and again settle on the bottom in a quiescent state. These little fishes are among the most interesting inhabitants of our fresh waters, and a valuable account of their habits will be found in a paper by Jordan and Copeland in the 'American Naturalist' for 1876.

Dartford, England, a market-town of Kent, in the narrow valley of the Darent River, two miles above its entrance into the Thames, and 17 miles east southeast of London. Edward III. here founded an Augustinian nunnery (1355); St. Edmund's chantry was a great place of pilgrimage; and at Dartford, Wat Tyler began his rebellion (1381). Spielman built here the first paper-mill in England (1590). There is considerable manufacturing, chief of which are the cotton goods, powder, paper, and corn meal, iron and iron products, oil, and chemicals. Pop. (1902) 18,965.

Dartmoor, an extensive, rugged, mountainous tract in England, in the western part of Devonshire, often called the "Forest of Dartmoor," but at present having no appearance of a forest, except what is afforded by some dwarf oaks, intermixed with ash and willow; reaching from Brent south to Oakhampton north, 22 miles, with a breadth of about 20 miles, and occupying from 130,000 to 150,000 acres. In the centre of the moor there is an extensive swamp in which the rivers Dart, Teign, Taw, Yealm, Erme, and a great number of smaller streams have their source. Cattle and sheep are fed on the coarse grass during the summer months. In the winter the storms from the Atlantic sweep over it, and it would be difficult to imagine a more desolate-looking place. Several of the rugged granite hills (here called "tors") are of considerable height, Yes Tor rising 2,050 feet above the plain. The district is noted as

DARTMOOR MASSACRE — DARTMOUTH COLLEGE

being the site of a prison built in 1809 for the custody of the French prisoners of war at a cost of \$635,000. At one time it contained 10,000 inmates. It covers an area of 30 acres, and is now fitted up for the reception of convicts. Experiments made in cultivating the moor by convict labor have turned out successfully. The large kaolin-works and a meteorological observatory are at Lee Moor. Dartmoor offers considerable attraction to the tourist and naturalist. Druidical and other aboriginal remains may be traced, especially Gray Wethers, which is thought to have been a Druidical temple. The dolmens, cairns, and other indications of an ancient town, are found at Drewsteignton. Since 1337 Dartmoor has been annexed to the duchy of Cornwall.

Dartmoor Massacre, The, 6 April 1815. During the War of 1812 the American naval prisoners of the British, with impressed American seamen discharged from British vessels, were collected at Dartmoor military prison. On 31 March 1815 they numbered 5,693, including about 1,000 negroes. They had heard of the Peace of Ghent, 24 Dec. 1814, and expected immediate release; but the British government refused to let them go on parole, or take any steps till the treaty was ratified by the Senate, 17 Feb. 1815. It took several weeks for the American agent to secure ships for their transportation home, and the men grew very impatient. On 4 April the dishonest food contractor attempted to work off some damaged hardtack on them in place of soft bread, and was forced to yield by their insurrection, and the commandant, Capt. T. G. Shortland, suspected them of a design to break jail. This was the reverse of truth in general, as they would lose their chance of going on the carts; but a few had made reckless threats of the sort, and the commandant was very uneasy. About 6 P.M. of the 6th he discovered a hole from one of the five prisons to the barrack yard near the gun-racks. Others had been begun, apparently for pastime. Some prisoners were outside the guard railing noisily pelted each other with turf, and many more near the breach (and the gambling tables), though the signal for return to prisons had sounded: altogether he was convinced of a plot, and rang the alarm bell to collect the officers and have the men ready. This luckless precaution brought back a crowd just going to quarters; just then a prisoner broke a gate-chain with an iron bar, and a number pressed through to the prison market square; and after attempts at persuasion, Shortland ordered a charge which drove part of the prisoners in. Those near the gate, however, hooted and taunted the soldiery, who fired a volley over their heads; the crowd yelled louder and threw stones, and the soldiers, probably without orders, fired a direct volley which killed and wounded a large number. Then, losing their heads, they followed the throng of prisoners struggling frantically to get within the prison doors, shooting them down as they went, some even going up to the doors and firing in; while others ran up to the walls and fired into the fleeing knots below. Finally the captain, a lieutenant, and the hospital surgeon (the other officers being at dinner) succeeded in stopping the murder and caring for the wounded — about 60, 30 seriously, besides 7 killed outright. The affair was examined by a

joint commission, Charles King for the United States and F. S. Larpent for Great Britain, who agreed in exonerating Shortland, justifying the first firing, blaming the subsequent, and pronouncing the culprits undiscoverable. The British government provided for the families of the killed, pensioned the disabled, and promoted Shortland. Consult: Charles Andrews, 'The Prisoners' Memoirs; or Dartmoor Prison'; Cobb, 'A Green Hand's First Cruise, Together with Five Months in Dartmoor.'

Dart Moth, a name applied to the genus *Agrotis*, a night-flying moth of destructive habits, the caterpillar of which is widely known as the cutworm. A European species is the winter dart moth which destroys wheat. The American group includes several species, most of which appear about midsummer. The caterpillars hide in the ground during the day, and at night come up to feed on the tender shoots of cabbage, corn, and other garden plants, which they usually cut off close to the ground. A recently discovered species, *A. Cochranii*, is a climbing cutworm, which destroys the leaves of apple, cherry, pear, and peach trees, and of grapes.

Dartmouth, därt'müth, Canada, town of Halifax County, Nova Scotia; connected by ferries with the city of Halifax of which it is practically a suburb. The chief manufactures are iron foundries, a sugar-refinery, tanneries, rope-works, and flour-mills. Fort Clarence is at the entrance of the eastern passage which leads to the town. In 1749 the town was founded, but two years after it was destroyed by Indians. Pop. (1902) 4,859.

Dartmouth, England, a seaport and municipal borough in the south of Devonshire; 3.2 miles south by west of Exeter. It is built in picturesque terraces on a steep slope 300 to 400 feet high, on the estuary of the river Dart, at a short distance from the sea. The streets are narrow, and many of the houses very old, with overhanging stories, projecting gables, and wood-carvings. St. Saviour's Church (1372) has a richly sculptured, painted, and gilt stone pulpit, and a beautifully carved rood-loft. A battery, and the remains of a castle built during the reign of Henry VII., stand at the entrance to the harbor. Sir Humphrey Gilbert was born at Greenway, on the opposite side of the Dart. Pop. (1901) 6,700.

Dartmouth College, a seat of learning in Hanover, N. H., which received its charter in 1769, and opened its doors the following year under the presidency of Eleazer Wheelock, D.D. It grew out of an earlier school established by Eleazer Wheelock in Lebanon, Conn., and designed for the education of Indian children. The idea of this school had been suggested to him by his success in educating a young Mohegan Indian, Samson Occom, who became a remarkable preacher. Other pupils from the Delaware tribe were afterwards received, and the school became an object of public attention and interest. In 1754, a farmer named Joshua Moor gave a house and two acres of land for the purposes of the institution, which was from this time known as Moor's Indian charity school. Occom, accompanied by the Rev. Nathaniel Whitaker, visited England to collect funds; a sum of about \$50,000 was subscribed, and a board of trustees was there organized, of which Lord Dartmouth,

DARTMOUTH COLLEGE.

1. Wilson Library.

2. Faculty Avenue.

DARTMOUTH COLLEGE CASE

one of the subscribers, was made president. The school was named Dartmouth, in honor of this generous donor. The school was so much resorted to by the native tribes that Dr. Wheelock determined to transfer to some place near to them. Many proffers of situations were extended to him, but he selected the town of Hanover, on the Connecticut River, in the western part of the state of New Hampshire, and grants of about 44,000 acres of land were made to him. The institution was chartered by Gov. Wentworth under the name of a college, with all the privileges and immunities of any university within the British realm. Moor's school soon afterward obtained an independent charter, and still remains as an academical or preparatory department. In 1770 Dr. Wheelock removed his family and school, consisting of 18 whites and 6 Indians, from Lebanon to the wilderness of Hanover, where the whole colony lived in log huts. In 1771 the first class of four students was graduated. President Wheelock retained his office till his death in 1779, and was succeeded by his son, John Wheelock, who in 1782 was sent by the trustees to Europe to promote the interests of the college; and through introductions by Gen. Washington, Dr. Franklin, and John Adams, he obtained considerable sums of money, philosophical instruments, and other valuable donations. William, Prince of Orange, was one of the donors. Wheelock returned in 1784, and after a presidency of 36 years, was removed from the office by the trustees, in 1815. This act, which was occasioned chiefly by a local religious controversy, led to a conflict with the legislature of the State; that body claimed the right to amend a charter of which it was the guardian, and in 1816 passed acts creating a new corporation in which the property was vested, and changing the title of the college to Dartmouth university. The old trustees began a suit for the recovery of the college property. (See DARTMOUTH COLLEGE CASE.) Upon the trustees regaining control, Wheelock was raised to the presidency of the university, in February 1817, but died within two months. He was succeeded by William Allen, D.D., who retained the office until the "College Case" was decided (1819).

Dartmouth College still remains an institution for men only. It comprises besides the regular classical departments; the Medical School founded in 1798; the "Chandler School of Science," established in 1851, by the trustees, on the receipt of a bequest of \$50,000, from Abiel Chandler, who left it to them in trust "for the establishment and support of a permanent department or school of instruction in the college, in the practical and useful arts of life." The course in this school, leading to the degree of bachelor of science, covers four years, and includes a course in general science, political science, modern languages, mathematics, and history. Another department is "The Thayer School of Civil Engineering," founded in 1867, by Sylvanus Thayer, a graduate of Dartmouth. This is a graduate school, comprising a two years' course in civil engineering. The government of this school is vested in a board of overseers, consisting of the president of Dartmouth College, with four officers of the engineer corps of the United States army, active or retired. The report of the college for 1902 gives the following statistics: Professors, 66; number of stu-

dents, 787; volumes in library, 85,000; and value of property, including endowments, \$3,200,000.

Dartmouth College Case, The. The Dartmouth College Case is the name by which is commonly known the action entitled Trustees of Dartmouth College *v.* Woodward, which is reported in volume four of Wheaton's United States Supreme Court reports. Perhaps no decision ever rendered in any tribunal has attracted more attention or exerted a greater influence over the legislative and judicial history of our land than has the decision in this case, which arose as follows:

In the year 1769 the Reverend Eleazar Wheelock, aided financially and politically by friends in England and America, conspicuous among whom was the Earl of Dartmouth, and with the assistance of the Province of New Hampshire, given in the form of extensive land grants, founded Dartmouth College under a charter from King George III. of England. This charter vested the control of the institution in a board of trustees, who were designated by Mr. Wheelock to manage the same, and under the management of those trustees so incorporated and their successors the college grew and prospered until the year 1815, when the State legislature passed an act amending its charter by which they curtailed the power of its trustees, changed its name to Dartmouth University and made it a State institution subject to State control. For protection against this infringement of their powers, the trustees had recourse to the courts in the now famous case above named.

In the State tribunals the decision went against the college trustees and an appeal was taken to the Supreme Court of the United States, the appeal being based upon the theory that the charter granting the control of the college to the trustees was a contract, that under Section X. of Article I of the Federal Constitution no State can pass an act impairing the obligation of any contract, and that the said act of the New Hampshire Legislature violated the contract of the charter of Dartmouth College.

It should be remembered that in 1819 when the case came up for final hearing, the popular views of the scope and effect of the National Constitution were far from harmonious. All then regarded that instrument as the greatest existing governmental compact, but the Republican party then in power demanded that it be so strictly construed as to preserve unimpaired the rights and powers of the individual States. On the other hand, there then presided over the Federal Supreme Bench, in the person of John Marshall, one of the "midnight appointees" of John Adams, the last President of that Federalist party which demanded so liberal a construction of the instrument as to give the country a strong national government. Of the section of the Constitution invoked, we may safely say with Ordronaux that "Drafted at a time when commerce was in its infancy; when public credit was depreciated to the lowest ebb; and confidence in monetary transactions almost destroyed, it was manifestly introduced as a barrier against the tide of repudiation which threatened to overwhelm both public and private credit." The framers of the Constitution never intended that clause to be given the interpretation urged in this case. But the case was up before a court

DARTMOUTH COLLEGE CASE

presided over by the jurist who has been truthfully said to have "found the Constitution a skeleton and clothed it with flesh and blood." Therefore, when it was clearly shown, as it was in the celebrated argument of Daniel Webster for the college trustees, that this case came fairly within the provisions of that section, in principle, the court, guided by John Marshall, held that the act of the New Hampshire Legislature was void because it impaired the obligation of a contract. Justice Duvall alone dissented.

This decision has perhaps been more severely criticised and has perhaps given rise to more strenuous efforts to escape its consequences than has any other decision of the tribunal which rendered it, and the reasons are obvious. While it gave assurance that capital invested in chartered business and charitable ventures would be forever protected from legislative interference, it also invited political corruption by saying in effect to promoters of corporations that the courts would protect them in the possession of every concession or right which they beguiled from pliant legislative bodies. It made possible the mechanical and industrial achievements of the 19th century in this country, but it also made profitable the limitless corruption which has attended those achievements and which has frequently, by virtue of this decision, stripped the government of very important powers.

But the correctness of a judicial decision is not to be gauged by its influence for weal or woe. Rather should that be determined by its conformity to the Constitution, the statutes and the judicial precedents upon which it rests and the approval given it by later decisions. Judged by this test we must hold that Marshall and his colleagues decided well in the Dartmouth College Case. The Supreme Court of the United States had early laid down the rule that there are certain vital principles of republican government which will overrule a flagrant and apparent abuse of legislative power. It had in the year 1810 declared a law granting land to private companies to be in effect a contract which could not be so repealed as to impair the obligation of that contract. If the passage of the law were procured by fraud the court there doubted its power to declare it void for those reasons, but if that power existed it could be exercised only under those rules of law and equity which govern private transactions. Two years later there came before the same court a case involving a somewhat similar question. The State of New Jersey had traded land with an Indian tribe and had, by legislative enactment, provided that the Indians should forever hold the lands received by them free from taxation. With the consent of the State they sold their lands and, the question being properly presented, the court held that the law granting the exemption was a contract, that the exemption ran with the land and that the purchasers from the Indians enjoyed the same exemption.

By the decision in the Dartmouth College Case the rules laid down in the foregoing cases were followed and their application extended to contracts in charters of incorporation, but their force when so applied had already been limited by another line of decisions. In 1804 Chief Justice Marshall, speaking for the court, had said that the charter gives to a corporation all of the powers it possesses and no powers not

granted can be exercised. A little later he had decided that there is a difference between a grant of corporate existence and a grant of peculiar remedies. The first is general. The second can only be exercised in those courts which the power bestowing the privilege can regulate. Moreover, as the bank charter involved in that case contained a clause making it a felony to counterfeit its notes, the court believed it to be a public act and subject to repeal by succeeding legislatures. And in the year 1819 the same court had decided that the right to use a peculiar form of attachment granted in its charter to a bank could be taken away at any time because "The forms of administering justice and the duties and powers of the courts as incident to the exercise of a branch of the sovereign power must ever be subject to the legislative will and the power over them is inalienable so as to bind subsequent legislatures."

It is thus made fully apparent that the Dartmouth College Case decided only that if a legislative grant, whether made in the form of a charter of incorporation or in any other form, conveyed to private citizens that which the legislature had power to contract away, the grant so made was a contract and no succeeding legislature could rescind the same without following the same rules which govern the rescission of private contracts. But if there is any doubt that such was the understanding of the chief justice who wrote the opinion of the court in that case, the same will be removed by a consideration of certain later decisions in which he participated. In the year 1821 the court over which he presided decided that Congress had power to incorporate a lottery to do business beyond the limits of the District of Columbia, yet, where no mention was made thereof in the charter, it would not be presumed that Congress had done so and had thereby deprived the States of their power to regulate lotteries by preventing the sale of tickets within their boundaries. In the same year the same court decided that a town government cannot contract away its legislative power. And in the case of *Providence Bank v. Billings*, the court presided over by Marshall decided that while a State might, through its legislature, grant immunity from taxation, it could not be presumed to have done so, and that, in the absence of any agreement to the contrary, it might tax to death a franchise which it had itself granted.

But the effect of the Dartmouth College decision was not fully understood at the time of its rendition and the States eagerly availed themselves of a suggestion found in the decision itself to the effect that if they wished the right to amend, alter or repeal charters granted by them they must expressly reserve that power. Such a reservation, whether expressed in the charter itself, the constitution or the general laws of the State, has been held to have the effect of "placing the State legislature back on the same platform of power and control over the charter containing it, as it would have occupied had the constitutional restriction never existed." Yet the later decisions hold that this reserve power must be reasonably exercised. The alterations must be made in good faith and consistent with the objects and scope of the act of incorporation. Sheer oppression and fraud cannot be inflicted under the guise of amendment or alteration. This power cannot be so

CHARLES DARWIN.

employed as to defeat or substantially impair the object of the grant or any right which has become vested under it. Where this power has been reserved, a State may tax property which it has forever exempted from taxation, but the taxes must not be greater than those imposed upon other property. It can regulate the charges of common carriers, but no such legislation must amount to the taking of private property for public purposes without due process of law. We thus see that not only was the Dartmouth College decision as moderate as any of the later cases which have been said to have practically overruled it, but that even where reservations in charters have obviated the effect of that decision the later courts have reached a similar conclusion by a different chain of logic.

S. V. WRIGHT,
Attorney, San Luis Obispo, Cal.

Darton, Nelson Horatio, American geologist: b. Brooklyn, N. Y., 17 Dec. 1865. He received a common school education and became a chemist and later a geologist. He has made many geological surveys for the United States Government. His chief work is 'Catalogue of North American Geology, 1732-1891.' Since 1890 he has been connected with the United States Geological Survey.

D'Arusmont, dā-rūs-môn, Madame Frances (maiden name FANNY WRIGHT), American philanthropist and author: b. Dundee, Scotland, 6 Sept. 1795; d. Cincinnati, Ohio. She married M. d'Arusmont in 1838, but the marriage was not a congenial one and her later years were spent in the United States. She lectured extensively on social, religious, and political questions. Among her works are: 'Views on Society and Manners in America'; 'Altorf,' a tragedy (1819); 'Lectures on Free Inquiry' (1836).

Darwar, dār'wār, or Dharwar, India, a town and fortress in the district of Bombay, 285 miles southeast of Bombay city, capital of a district of the same name. The town exports cotton and rice. It is connected by railroad with Goa, the Portuguese colony, and with other places. Pop. (1901) 31,279. The district of Darwar has an area of 4,603 square miles. The soil and climate are well adapted to the cultivation of cotton. Pop. 1,051,314.

Dar'wen (till 1889 OVER DARWEN), England, a municipal borough in the county of Lancaster. It has among its public buildings numerous churches and chapels, a market-house, public baths, free library, theatre, technical-school, hospitals, etc. The staple manufacture is cotton. The other manufactures are paper, iron castings, machinery, earthenware, etc. The water, electric, and gas plants are owned by the city. Pop. (1901) 38,211.

Darwin, Charles Robert, English naturalist: b. Shrewsbury, 12 Feb. 1809; d. Down, Kent, 19 April 1882. His father, Robert Waring Darwin, was a distinguished physician of that town, the son of a still more distinguished father, Erasmus Darwin (q.v.) He was educated at Shrewsbury school, and at the universities of Edinburgh and Cambridge. He early devoted himself to the study of natural history, and in 1831 was appointed naturalist to the surveying voyage of H.M.S. Beagle, commanded by Captain (afterwards Admiral) Fitzroy. He served without salary, and paid a portion of his expenses on condition of having at his own disposal such collections of specimens as he might make during the voyage. The vessel sailed in December 1831, and did not return till October 1836, after having circumnavigated the globe. Darwin came home with rich stores of knowledge, part of which he soon gave to the public in such works as his 'Journal of Researches into the Natural History,' etc. (1839), of the countries visited, the 'Zoology of the Voyage of the Beagle' (1840-42); 'Structure and Distribution of Coral Reefs' (1842); 'Volcanic Islands' (1844); 'Geological Observations' (1846). Though known among naturalists as a man of distinguished ability, to the general public his name was not familiar, when all at once it attained a celebrity second to none by the publication in 1859 of 'The Origin of Species by Means of Natural Selection.' This work, scouted and derided though it was at first in certain quarters, may be said to have worked nothing less than a revolution in biological science. In it for the first time was given a full exposition of the theory of evolution as applied to plants and animals, the origin of species being explained on the hypothesis of natural selection. The central idea of the work is that all forms of organic life are derived from a small number of primitive types, and that all the vast variety of vegetable and animal organisms now existing, or having formerly existed, have owed their origin to the slow and gradual operation of the modifying influence of local or special causes transmitted hereditarily; such forms as best suit any particular time and locality being selected and adapted by the action of natural laws for that time and locality. The theory of evolution was warmly taken up by some of the ablest men of science, and now there are few who have not in whole or in part given in their adherence to the principle. The rest of his works are largely based on the material he had accumulated for the elaboration of the great theory. See DARWINIAN THEORY. The principal are a treatise on the 'Fertilization of Orchids' (1862); 'Domesticated Animals and Cultivated Plants'; or 'The Principle of Variation, etc., under Domestication' (1867); 'Descent of Man and Variation in Relation to Sex' (1871); 'The Expression of the Emotions in Man and Animals' (1872); 'Movements and Habits of Climbing Plants' (2d ed., 1875); 'Insectivorous Plants' (1875); 'Cross and Self-Fertilization' (1876); 'Different Forms of Flowers' (1877); 'The Power of Movement in Plants' (1880); 'The Formation of Vegetable Mould' (1881); the latter dealing exhaustively with the common earthworm. Darwin was buried in Westminster Abbey. See 'Life and Letters of Charles Darwin' (1887).

DARWIN — DARWINIAN THEORY

Darwin, Erasmus, English physician and poet: b. near Newark, Nottinghamshire, 12 Dec. 1731; d. near Derby, 18 April 1802. Settling at Lichfield he acquired a great reputation and an extensive practice. His son, Robert, was father of the famous Charles Darwin. Erasmus Darwin's name is chiefly remembered for his poem of 'The Botanic Garden,' which is comprised in two parts; the first treats of the 'Economy of Vegetation' (1792), the second of the 'Loves of the Plants' (first published in 1789). It was received with much favor; but a very ingenious parody, entitled: 'The Loves of the Triangles,' published in the 'Anti-Jacobin' (and written either by Canning or Frere), greatly damaged its popularity. In 1794 Dr. Darwin published the first volume of 'Zoonomia, or the Laws of Organic Life'; the second volume, completing the work, appeared two years afterward. In 1799 he published 'Phytologia, or the Philosophy of Agriculture and Gardening.'

Darwin, Francis, English botanist: b. Down, Kent, 16 Aug. 1848. He is the son of Charles Robert Darwin (q.v.); was educated at Trinity College, Cambridge, and studied medicine at St. George's Hospital in London. He did not practise medicine, but assisted his father in his work at Down, and was later made reader in botany at Trinity College. His works include: 'Life and Letters of Charles Darwin' (1887); 'Charles Darwin' (1892); 'Practical Physiology of Plants' (with E. H. Acton 1894); 'Elements of Botany' (1895); and a number of papers on botanical subjects.

Darwin, George Howard, English scientist: b. Down, Kent, 9 July 1845. He is the eldest son of Charles Robert Darwin (q.v.); was educated at Cambridge, studied law and was admitted to the bar, but did not practise. He was a fellow of Trinity College, Cambridge, 1868-78; was a member of the expedition to Sicily to observe the eclipse in 1870-71; and was appointed Plumian professor of astronomy and experimental philosophy at Cambridge in 1883. Among his writings are: 'Small Deflections of the Plumb Line due to the Movement of the Earth'; 'Periodic Orbits' (1896); 'Tides and Kindred Phenomena in the Solar System' (1898) and other papers on astronomical subjects.

Darwinian Theory, the explanation of the working of natural selection in effecting specific changes in plants and animals. "Darwinism" must not be confused with "Evolution." The term Darwinism is applied to one particular interpretation of the mechanism of the universe, and is summarized in Darwin's great work: 'The Origin of Species by Means of Natural Selection.' Whatever may be the future development of our evolutionary ideas, the epoch-making importance of the Darwinian theory will be unaltered.

Outline of Origin of Species.—To gain an insight into the means of modification, Darwin begins with a study of the variation of plants and animals under domestication. Those who admit the unity of domestic races should be cautious in denying the unity of the wild ones. Domestic races all exhibit adaptations to man's use or fancy, rather than to their own good. The key to this is man's power of selection. Nature gives successive variations, man accumulates these, so making for himself useful breeds, and often (for example, in sheep, cattle, roses, dahlias) pro-

foundly modifies their character even in a single human lifetime; so that in all the characteristics to which he pays attention they may differ more than the distinct species of the same genera. Unconscious selection, which results from everyone trying to possess and breed the best animals, is even more important than conscious selection. Two flocks of Leicester sheep kept equally pure appear quite different varieties after 50 years. Such slowly accumulated change explains why we know so little of the origin of domestic races; and its absence in regions inhabited by uncivilized man explains why these yield no plants worth immediate culture. Human selection is facilitated (1) by the keeping of large numbers, since variations will be more frequent; and (2) by preventing free intercrossing. Some species vary more than others.

Variation Under Nature.—No two blades of grass are alike, and far more marked differences often occur, several strains or varieties sometimes existing in the same species. Between these strains, and much more frequently between forms which systematic botanists and zoologists rank as true species, perfectly intermediate forms may occur. No agreement about the definition of species (the amount of difference necessary to give any two forms specific rank) has ever been reached. Individual differences are of the highest importance, as the first steps toward the slightest varieties worth recording; these in turn toward more distinct and permanent varieties; these varieties again toward sub-species, and in the next stage to species, though extinction may often arrest the process. The species which present most varieties are those which have the greatest geographical range, or the widest diffusion in their own territory, or which possess the greatest number of individuals.

Struggle for Existence.—All organic beings tend to increase with extreme rapidity, so that if they were not kept down, the earth would soon be covered by the progeny of a single pair. Since organisms are reproducing themselves so rapidly, and not all their offspring can escape their enemies, get food and live, much less leave progeny in turn, there must in every case be a struggle for existence, either of one individual with another of the same species, with the individuals of distinct species, or with the physical conditions of life; often with all these at once, and that more or less intensely throughout the whole duration of life. The checks which prevent increase are more obscure, and vary in each case. In all cases the amount of food gives the limit. The youngest organisms generally suffer most. The stock of game on an estate depends chiefly on the destruction of vermin. Climate is important, and periodic seasons of extreme cold and drought seem the most effective of all checks. Epidemics too may occur, especially where numbers have inordinately increased. The struggle for life is most severe among individuals and varieties of the same species, and among the species of the same genus, since these tend to fill the same place in the economy of nature. The structure of every being is related to that of the others with which it competes, or from which it seeks to escape, or on which it preys.

Natural Selection.—The natural process which results in the preservation of favorable variations, and the elimination of injurious ones, is termed by Darwin "Natural Selection," or less

DARWINIAN THEORY

figuratively by Spencer, the "Survival of the Fittest." No country can be named where the native inhabitants are perfectly adapted to their conditions and competitors, for as some foreigners have taken firm possession in every country, we may safely conclude that the natives might have been modified with advantage to resist them. Human selection acts only for man's own good, on mere external and visible characters, and irregularly throughout a short period; natural selection acts for the good of the being itself, on the whole machinery of its whole life, and incessantly on the species, throughout almost infinite time. It leads to the improvement of each creature in relation to its organic and inorganic conditions of life, and consequently in most cases to what must be regarded as an advance in organization. The circumstances favorable to the production of new forms are great variability; large numbers of individuals; the complex effects of intercrossing; isolation in small areas; also extension over continental ones, especially if these vary in altitude; and considerable lapse of time. Rare species are shown to be in process of extinction. The divergence of character in domestic breeds, largely due to the fact that "fanciers do not, and will not, admire a medium standard, but like extremes," applies throughout nature from the circumstance that the more diversified the descendants from any one species become in structure, constitution and habits, by so much will they be better enabled to seize on many and widely diversified places in nature, and so to increase in numbers. A carnivorous animal which has reached the maximum numbers its territory can support, cannot succeed in increasing unless its varying descendants seize places hitherto occupied by other animals. This must hold equally true of all species, and is separately demonstrated for plants. The greatest amount of life can be supported by help of proportionally great diversification of structure; hence, in small areas where competition is severe, the inhabitants are extremely varied.

Sexual Selection.—Not merely do individuals struggle for existence, but the males struggle for the females, and the most vigorous tend to leave most progeny. Several weapons, offensive and defensive, like the cock's spurs, the stag's horns, or the lion's mane, are used in this struggle, and the most useful variations are those which are transmitted. Just as man can in a short time give beauty to his domestic birds, so there is no reason to doubt that female birds, in thousands of generations by selecting, as they are observed to do, the most melodious or beautiful males, might produce a marked result, and many sexual differences are thus explained.

Laws of Variation.—The same laws appear to have acted in producing the lesser differences between varieties of the same species, and the greater differences between species of the same genus. Specific characters are more variable than generic, and varietal than either. Rudimentary organs and secondary sexual characters are variable. Zebra-like stripes on horses, or wood-pigeon's markings on fantails, tumblers, etc., may be explained as reversions toward their ancient progenitors.

Geological Succession of Organic Beings.—The most ancient forms differ widely from those now living, yet frequently present characters intermediate between groups now widely divergent, and resemble the embryos of the more recent and

more highly specialized animals belonging to the same classes. These, and the important law of the succession of the same types within the same areas during the later geological periods, and most notably between the Tertiary Period and the present time, cease to be mysterious, and become at once thoroughly intelligible on the principle of inheritance, and on that alone. Darwin's belief that the distinctness of birds from all other vertebrates was to be accounted for by the extinction of a long line of progenitors connecting them with reptiles, was in 1859 a mere assumption; but in 1862 the long-tailed and palpably reptilian bird *Archæopteryx* was discovered, while in 1875 the researches of Marsh brought to light certain cretaceous birds, one with teeth set in a groove, the other with teeth in sockets, and with bi-concave vertebrae. Besides these reptilian birds, bird-like reptiles have similarly been forthcoming, and the hypothesis of Darwin is thus admirably verified.

Geographical Distribution.—Neither the similarity nor the dissimilarity of the inhabitants of various regions, whether of land or of sea, can be accounted for by identity or differences of climate, or other physical conditions; but both are related in the most striking degree to the absence or presence of barriers to migration between those regions.

Morphological Arguments.—The physiological and distributional lines of argument furnished by morphology are mainly four, and are derived from (a) Classification, (b) Homologies, (c) Embryology, (d) Rudimentary Organs. The great fact of classification is that organic beings, throughout all time, are arranged in groups subordinated under other groups, individuals under varieties, and these again under species; species under genera; genera under sub-families, families, and orders; and all under a few grand classes. The nature of all these relationships established by naturalists receives a simple and natural explanation on the view of the common descent of allied forms with modification through variation and natural selection, no other explanation ever having been attempted. The element of descent is already used in linking all the sexes, ages, forms, and varieties of the same species, widely though these may differ from each other in structure.

The members of the same class, independently of their habits of life, resemble one another in their general plan of organization. Thus the hand of man, the digging-paw of the mole, the leg of the horse, the paddle of the porpoise, and the wing of the bat, are all constructed on the same pattern, bone corresponding to bone. This conformity to type is "powerfully suggestive of true relationship, of inheritance from a common ancestor"; and admits of a simple explanation in terms of the evolutionary theory, thus strengthening that theory.

Serial Homology is that unity of type which is found on comparing the different parts and organs in the same individual. The complex and varied jaws and legs of a lobster, or the different leaves, sepals, petals, stamens, and pistils of a flower, are all found to be modifications of a simple limb and a simple leaf-organ respectively. Not only are such metamorphoses apparent on comparison, but they can be actually observed during the development of each individual. So closely do the embryos of the most distinct species belonging to the same class resemble each

DARWINIAN TUBERCLE — DASYURE

other, that even Von Baer was unable to decide whether two unlabelled specimens were lizards, birds, or mammals. The process of development goes from the general to the special; thus there is generally an advance in organization. In peculiar conditions degeneration may occur. All these facts are explained on the principle of successive slight variations not necessarily or generally supervening very early in life, and inherited at a corresponding period; hence it is in the highest degree probable that most embryonic stages show us more or less completely the progenitor of the group in its adult state; and embryology thus rises greatly in interest. Darwin points out that the theory of evolution by natural selection is no more inimical to religion than is that of gravitation, to which the same objection was raised.

JOHN FISKE.

Darwinian Tubercle, a small raised portion, or tubercle, that may be found on the pinna of the ear. It is said to be present in a number of the primates and by many scientists has been regarded as an evidence of degeneracy in mankind. Different forms of Darwinian tubercles are described by anthropologists, but they have no real special significance.

Dasent, dā'sənt, **SIR George Webbe**, English philologist and novelist: b. St. Vincent, West Indies, 1820; d. near Ascot, Berkshire, 11 June 1896. He was for a while one of the editors of the London *Times*, and was one of the civil service commissioners. He was eminent as a scholar in the Norse languages, particularly Icelandic, and translated the 'Younger Edda,' besides many other ancient stories and legends of Iceland, and wrote 'The Norseman in Iceland' (1858); 'The Story of Burnt Njal' (1861). Among his original stories are: 'Annals of an Eventful Life'; 'Three to One'; 'Half a Life.'

Dash, Countess, pseudonym of **Gabrielle Anne Cisterne de Courtiras**, VICOMTESSE DE SAINT-MARS. French novelist: b. Poitiers, 2 Aug. 1804; d. 11 Sept. 1872. She was a very prolific writer, producing often five or six stories in the course of a year. Life in high society is her theme, and especially wayward love in high society, as the titles of most of her novels indicate: 'Bussy-Rabutin's Amours'; 'Gallantries of the Court of Louis XV.'; 'Last Amours of Mme. du Barry'; 'Adventures of a Young Married Woman.'

Dashkoff, dāsh'kōf, **Princess Ekaterina Romanovna**, Russian scholar: b. St. Petersburg 22 March 1743; d. 16 Jan. 1810. She married Prince Dashkoff when only 15 years old, but was left a widow three years after. She was an intimate friend of the Empress Catharine II., and one of the heads of the conspiracy formed against Peter III., the success of which secured the throne to Catharine. Soon afterward quarreling with Catharine, she obtained permission to travel, and visited Germany, England, France, and Italy, making the acquaintance of many eminent men. On her return the princess was appointed director of the Academy of Arts and Sciences; and in 1783, president of the Russian Academy, established at her own suggestion in imitation of the French Académie. Besides writing several comedies and occasional papers, the Princess Dashkoff was mainly instrumental in inducing the Russian Academy to draw up a dictionary

of the Russian language, and herself executed part of the work. See her very interesting autobiography (trans. 1840).

Daskam, Josephine Dodge, American writer: b. Stamford, Conn., 17 Feb. 1870. She was educated at Smith College and in addition to frequent contributions to magazines has published in book form 'Smith College Stories' (1900); 'A Sister's Vocation and Other Girls' Stories' (1900); 'The Imp and the Angel' (1901); 'The Madness of Philip' (1900); 'The Best Nonsense Verses' (edited; 1902).

Dass, däss, **Peder**, päd'er, or **Petter**, Norwegian poet: b. Nord-Herø, parish of Alstahoog, Nordland, 1647; d. Aug. 1708. He studied at the University of Copenhagen, became pastor of the parish of Alstahoog in 1680 and grew rich from commerce and fisheries, buying for himself the royal domain of Vefsen. He became the most popular poet in Norway, leaving 127 poems of which only 24 are now extant, his masterpiece being a descriptive poem: 'The Trumpet of the Nordland,' written in the Dano-Norwegian dialect.

Dassy, or **Dassie**, the name given in South Africa to the rock-rabbit (*Procapra capensis*), the Dutch name for which is klip-das. The name dassy is merely a diminutive in local use, especially in Cape Colony. See HYRAX.

Dasyproc'ta, a genus of agoutis (*Dasyproctidae*), a familiar group of rodent mammals inhabiting Central and South America, and some of the West India Islands. The agoutis are a little larger than the common rabbit, have a rabbit-like head, but with short ears, hooped, pig-like claws, and are swift-footed. They live in the woodland, and search for food by night in the open country.

Dasyure, dās'ī-ūr, a marsupial native to Australasia; and belonging to the family *Dasyuridae*. It is the survivor of the fossil forms found in Tertiary strata in South America, and elsewhere; and is allied to the opossum. The hind and fore legs are about equal in length, and the toes are furnished with claws; the long hairy tails are not prehensile. The dasyures are chiefly strong, fierce creatures of cat-like propensities, whose depredations have caused heavy losses in farming and ranching districts, so that the colonists of Australasia, more especially those of Tasmania, have nearly exterminated them, by persistent effort. Among them we find the Tasmanian zebra-wolf (*Thylacinus cynocephalus*), a wolf-like creature, rather smaller than the common wolf, with short fur, a long smooth tail, and rounded ears. Its color is brownish, and it is barred at the hinder portion of the back and the roots of the tail with dark stripes. It prowls about by night, making raids upon unguarded sheep-folds. By day, it skulks in caverns among the rocks. Another foe to the flocks is the Tasmanian Devil (*Sarcophilus ursinus*). This creature, in size like a badger, in appearance like a bear, is ponderous, powerful, dark-colored, and covered with a coat of long fur. It sleeps by day; and, like the zebra-wolf, seeks its prey by night. It is very strong and ferocious; but despite this, has been successfully put down by the colonists; in fact, it has been nearly exterminated. Another species is the Australian "native cat," a spotted creature, almost as large as a house-cat. It belongs to the genus *Dasyurus*,

DATARIA — DATE-SHELL

in which are also several other and smaller species. Perhaps the most interesting of the small Dasyures, is the banded ant-eater (*Myrmecobius fasciatus*) found in western and southern Australia. It is a reddish brown in color, banded posteriorly with white; is about the size of a squirrel, and has a long protrusile tongue for gathering its insect food. It is considered as a practically unmodified representative of certain extinct marsupials found in the Secondary rocks of Europe. It lives in sandy plains, where it finds food in plenty. Other species, small as rats and mice, and living chiefly on insects, birds, eggs, etc., are found in the genus *Phascogale*, and allied genera; and the jerboa-like creature (*Antechinomys laniger*) constitutes another genus, of a single species. It is native to Queensland and New South Wales, but is very rare. See MARSUPIALS.

Data'ria, an office of the Curia Romana (q.v.) from which are sent forth certain classes of papal documents, as dispensations and appointments to Church benefices. The word had its origin in the formula of subscription of letters, for example, *Data Kalendis Martii*, given (or sent) 1 March; that is the date of the document; and it is the duty of the Dataria to guard against possible errors of either dating or addressing documents, or in the tenor of the documents themselves.

Date, any given, fixed, or settled time; the time when any event happened; period; era; age; epoch; as, the date of the Christian era, the date of a historical occurrence, etc. Also, that addition to a writing which specifies the year, month, and day when it was given or executed; the number which marks the time when any writing, instrument, coin, picture, etc., was executed. Under the Romans the word *datum* was used to signify the day on which the bearers of imperial despatches received them at Rome, or delivered them in the provinces. It was also employed in documents in the time of the French Merovingian kings. See EPOCH; CHRONOLOGY.

Date Line. See INTERNATIONAL DATE LINE.

Date, or **Date Palm** (*Phoenix dactylifera*) a tall tree of the natural order *Palmaceæ*. It is most notable for its fruit, which is an important part of the daily food of the natives of western Asia and northern Africa, where the tree is indigenous and from whence large quantities of dried dates (the fruits), are exported to other countries. The tree is also cultivated in some other warm countries, including China, Italy, France, Spain and parts of the United States, — Florida, New Mexico, Arizona and California, in the last three of which a promising industry seems to be becoming started. The tree, which attains a height of 100 feet, and bears fruit for one or two centuries, is, like other palms, useful in many ways; nearly all its parts are used for something. Date seeds are roasted and used as a substitute for coffee, or ground and pressed for oil and the pomace used for stock food. The leaves are used for matting, baskets, thatch, etc.; the terminal bud as a vegetable; the wood for fence making and other purposes where great strain is not expected; the fibre of the bark for making rope; but the fruit, which contains proteids, gum, and pectin, and is particularly rich in sugar, is the most important part. It is one

of the principal sources of wealth in the countries where the date is indigenous. It is believed that the leaves of this palm are the ones referred to in biblical writings, and at the present time the leaves of this palm are largely used upon Palm Sunday among Christians living where the trees abound. The leaves were also symbolical of victory, beauty, etc., among the ancient Greeks and Jews.

Since the male and female flowers are borne on separate trees, enough specimens of staminate flowering trees must be planted to fertilize the blossoms on the others which alone produce fruit. Since the plants obtained from seeds are of unknown sex until they flower, and since the proportion of inferior seedlings to seedlings which bear superior fruit is very large, the date is propagated by means of suckers, since these retain the characteristics of the parent. The young plants are set in sunny situations, in almost any kind of soil where water is within reach of the roots or can be supplied by irrigation. The sandy, alkaline soils of deserts seem more satisfactory than the richer soils necessary for the growth of general crops. The trees are very difficult to make grow after transplanting, because they demand special attention especially as to watering. A loss of 50 per cent is not uncommon even with the best of attention. The surviving trees should commence to bear when about eight years old. The fruit is borne in clusters which hang from the thick crown of large pinnate leaves. Individual trees produce from 300 to 500 pounds or more of fruit in a season. Consult: Bulletin No. 29, Arizona Experiment Station, Phoenix, Arizona.

Date-plum, a common name for plants of the genus *Diospyros*, of the ebony family (*Ebenacæ*). The genus has about 100 species and is most abundantly represented in Asia. In America two species are known, the most common being the persimmon (q.v.), *D. virginiana*. The common date-plum or pishamin, also called the European lotus and the date of Trebizond (*D. lotus*), is a tree 18 to 30 feet high, with oblong shining leaves and small reddish-white flowers, a native of the coasts of the Caspian Sea, northern Africa, etc., but cultivated and naturalized in the south of England. Its fruit is of the size of a cherry, and in favorable climates larger, yellow, sweet, and astringent. It is eaten when overripe, like the medlar, or is used for preserves. This fruit has been supposed by some to be the *lotus* (q.v.) of the Lotophagi. *D. mabola* is cultivated as a fruit-tree in Mauritius. *D. kaki*, sometimes called the keg-fig, is a native of Japan, and occasionally is kept in greenhouses in France and England. The sweetmeat called *figues-caques* is made from this fruit in France. The fruit of some other species is also edible, as, for example, that of *D. decandra* of Cochin-China. See EBONY; PERSIMMON.

Date-shell, or **Date Fish**, a bivalve shell or its inhabitant of the genus *Pholas*, a kind of mollusk. They bore holes in clay, peat, and soft rocks, and in some instances in hard stone, as in columns from the Temple of Serapis, which were brought from Africa to Italy. Species of the date-shell are found in the Mediterranean and its arms, on the coast of California and in a few places on the west shore of the Pacific. Some are edible.

Datha, American cacique. He governed the province of Chicora, on the east coast of Florida, visited by Lucas Vazquez de Ayallon, auditor of San Domingo, in 1520. He was a giant, and Helps, in the 'Spanish Conquests in America,' says: "His gigantic stature had been artificially produced, for it is said that the Indians of those parts had a method of elongating the bones of children when very young, a practice which they applied to those of royal race."

Datholite. See DATOLITE.

Datia. See DUTTEEAH.

Datiscin, da-tis'sin, a substance yielded by the bastard hemp, *Datisca cannabina*, a common plant in gardens, indigenous to the Punjab, and largely used in the south of Europe and in Asia for dyeing yellow. It can be extracted from the leaves and roots by exhausting with alcohol, concentrating, adding water, filtering from a resin, crystallizing and purifying the glucoside so obtained. When pure it forms colorless silky needles, which are readily soluble in alcohol, sparingly in ether and in water, and have a bitter taste. It has feeble acid properties, and gives yellow compounds with lead and tin which can be used as dyes. When boiled with dilute acids it is resolved into sugar and *datiscecin*, which crystallizes readily. It is soluble in alcohol and in ether, almost insoluble in water. It also gives a fine yellow color when combined with lead.

Dative, in grammar, one of the cases of nouns and pronouns, the usual function of which is to mark the recipient of something given. In English there is no distinctive form for this case; yet when we say, for instance, "give me or him that," "I gave the man a crown," *me*, *him*, and *man* are really in the dative. In Latin, Greek, Sanskrit, German, etc., there are distinct forms for this case. See CASE.

Dattiya. See DUTTEEAH.

Dat'olite, dāt'o-lit, or Dath'olite, a basic silicate of boron and calcium, having the formula $H_2O.2CaO.B_2O_3.2SiO_2$, and crystallizing in the monoclinic system. Its crystals are glassy in appearance, white in color (often with a greenish tinge), and transparent or translucent. Before the blow-pipe it melts with intumescence, and gives a green color to the flame. Its hardness is from 5 to 5.5, and its specific gravity is about 3. In the United States it occurs in Connecticut, New Jersey, and the Lake Superior district. It is also found in the Salisbury Crags near Edinburgh, as well as in Norway, Sweden, and other parts of the European continent. The name is from two Greek words that refer to the tendency that one of its massive varieties exhibits, to divide into granular portions. The crystals when polished are used as ornaments.

Datura, da tū'ra, a genus of plants of the potato family (*Solanaceæ*). It contains about 125 species, widely distributed. The genus is represented in the United States by coarse weeds naturalized from tropical America. Jamestown or Jimson weed (*D. stramonium*) is said to have received its name from a poisoning that occurred from its use by the settlers of

Jamestown, Va. It is also called thorn-apple. It is found in waste places from the eastern seaboard west to Minnesota and Texas. The purple thorn-apple or purple stramonium (*D. latula*) is found throughout the same region as the Jimson weed, but the entire-leaved thorn-apple (*D. metel*) does not grow far from the Atlantic coast. An extract from these plants is used in medicine. When taken internally it is a powerful narcotic; medically it is used in mania, convulsions, epilepsy, tic-douloureux, etc. When smoked it palliates the symptoms in asthma. *D. tatula* and *metel* are similarly used. The seeds of these two latter species are said to have been used to produce the frenzied ravings of the priests in the Delphic and some other temples. The Peruvians use for the same purpose *D. sanguinea*, manufacturing from it also an intoxicating beverage.

Datu'rine, a poisonous alkaloid found in the thorn-apple (*Datura stramonium*), and now known to be identical with atropine (q.v.).

Daub, dowp, Karl, German Protestant theologian: b. Cassel, Germany, 20 March 1705; d. Heidelberg, Baden, 22 Nov. 1836. Professor of theology at Heidelberg from 1795. His works include 'Lehrbuch der Katechetik' (1801); 'Theologumena' (1806); 'Die Dogmatische Theologie jetziger Zeit' (1833), etc.

Dauban, Jules Joseph, zhūl zhō'zēf dō-bān, French painter: b. Paris 31 May 1822. He was a pupil of Auguste Debay. His taste led him to historical and religious subjects, and his compositions, severe in design and of a great simplicity in the accessories, are somewhat cold and sober in color. He became director of the museum and the School of Fine Arts in Angers in 1849, received a medal in 1864 and the decoration of the Legion of Honor in 1868. Among his works are: 'Louis XI. presenting Guillaume de Cerizay as Mayor of Anjou' (1861); 'Reception of a Stranger by the Trappists' (1864), Luxembourg Museum; 'Trappists Exchanging the Kiss of Peace before Communion' (1865), Museum of Angers; 'Madame Roland Going to the Revolutionary Tribunal' (1869); 'Fra Angelico da Fiesole' (1873); and several portraits and decorative paintings.

Daubenton, Louis Jean Marie, loo-ē zhōñ mā-rē do-bān-tōn, French naturalist and physician: b. Montbard Côte-d'Or, France, 29 May 1716; d. Paris 31 Dec. 1799. He became celebrated for his participation in the Natural History of Quadrupeds by his friend Buffon; the anatomical part of which was prepared by Daubenton with great accuracy, clearness, and sagacity. In 1744 he was chosen member of the Academy of Sciences, and enriched its publications by a number of anatomical discoveries, and also by researches concerning the species of animals and their varieties, the improvement of wool, and the treatment of the diseases of animals. He threw much light upon mineralogy, botany, and agriculture, and proposed a new method for the classification of minerals. He was the author of numerous works of general utility: for example, 'Instruction pour les Bergers' (1782); 'Mémoire sur les Indigestions,' and many others. He became professor of natural history in the College of Medicine in 1778, and about seven years after professor of mineralogy in the Museum of Natural History. Dur-

ing the Reign of Terror, when every one was required to give some evidence of patriotic spirit, he was represented to his section as employed in introducing the Spanish sheep into France.

Daubeny, dâ'bē-nī or dōb'nī, Charles Giles Bridle, English scientist: b. Stratton, Gloucestershire, 11 Feb. 1795; d. Oxford 12 Dec. 1867. He was educated at Winchester College and Magdalen College, Oxford, and practised for some years as a physician in Oxford. In 1818 he visited Auvergne, and in 1837 made a scientific visit to the United States. In 1822 he was admitted a Fellow of the Royal Society, and from 1822 to 1855 was professor of chemistry in the University of Oxford. In 1834 he became professor of botany, and in 1840 of rural economy in the same university. He held the last appointment till his death. His principal works are: 'A Description of Active and Extinct Volcanoes' (1826); 'An Introduction to the Atomic Theory' (1831; with a supplement, 1840); 'Report to the British Association on Mineral and Thermal Waters' (1836); 'Lectures on Agriculture' (1841); 'Sexuality of Plants' (1860); 'Climate' (1863).

D'Aubigné, Jean Henri Merle, zhōn ōn-rē mērl dō-bēn-yā, Swiss ecclesiastical historian: b. Eaux-Vives, near Geneva, Switzerland, 16 Aug. 1794; d. Geneva 21 Oct. 1872. In 1818 he became pastor of the French Protestant Church in Hamburg. In 1823 he was appointed court-preacher at Brussels; but after the revolution of 1830 returned to Geneva, and filled the chair of Church history in its theological seminary until his death. The work which has given him a widespread reputation is his 'Histoire de la Réformation au Seizième Siècle' (1835-53); it has been translated into most European tongues, and has attracted more notice abroad than at home; it is written with a devout, fervid sympathy that is often eloquent, although the narrative is too graphic to be everywhere exact. Its popularity has been very great. Among his other writings are: 'Germany, England, and Scotland' (1848); a vindication of Cromwell (1848); 'Trois Siècles de Lutte en Ecosse' (1849); and 'Histoire de la Réformation en Europe au Temps de Calvin' (1862-78).

D'Aubigné, Merle. See D'AUBIGNÉ, JEAN-HENRI MERLE.

D'Aubigné, Théodore Agrippa. See AUBIGNE, D'.

Daubigny, Charles François, shārl frān-swā dō-bēn-yē, French landscape painter and etcher: b. Paris 15 Feb. 1817; d. there 19 Feb. 1878. He studied under his father, who was a miniature painter, Paul Delaroche, and others; and from 1838 exhibited in the Salon, though his full recognition came only after the artist had reached his 50th year. He devoted himself to close and sympathetic study from nature, working much on the Seine in a house-boat, and developed a style of landscape art marked by singularly unaffected fidelity and originality. In 1853 he gained a first-class medal with his 'Pool of Gylén.' In 1857 he produced his 'Springtime'; in 1861 'The Banks of the Oise'; in 1872 'Windmills at Dordrecht'; and in 1877 his large and very impressive 'Rising Moon.' His 'Sluice in the Valley of Optevos' (1855), and his 'Vintage' (1863), are in the

Luxembourg Gallery. His is also known as a book-illustrator and as a vigorous etcher, having produced over 100 plates, some reproductions, others direct from nature, marked by great frankness of method and free painter-like quality. See Henriot, 'Daubigny et son œuvre' (1878); Van Dyke, 'Modern French Masters' (1896); Stranahan, 'History of French Art' (1900).

D'Aubusson, Pierre. See AUBUSSON, PIERRE D'.

Daucus, dâ'kūs, the typical genus of the *Umbellifera* or carrot family. The genus has about 25 species, two of them growing wild in America. Wild carrot, crow's-nest, or Queen Anne's lace (*D. carota*), is generally a pernicious and abundant weed throughout the Union. It is a native of Asia, naturalized from Europe. It is the original of the cultivated carrot. See CARROT.

Daudet, Alphonse, āl fōns dō-dā, French novelist: b. Nîmes 13 May 1840; d. Paris 16 Dec. 1897. He was educated at the Lyons Lycée, and for two years after leaving it supported himself as an usher at Alais. Going to Paris in 1857 he took to writing verse, his first volume being 'Les Amoureuses' (1858), which met with some success. This was followed by other poems, including 'La Double Conversion' (1859), and at this time he also contributed to the 'Figaro,' and other journals. About 1862 he began writing for the stage, and during the succeeding 10 years or so several dramas by him were represented, but with only moderate success. These included: 'La Dernière Idole' (1862); 'L'Éillet Blanc' (1865), and 'Le Frère Aîné' (1868). Greater public favor was accorded to his 'Lettres de Mon Moulin,' which appeared in 1866 in a Parisian journal. In 1872 he produced his celebrated 'Les Aventures Prodigieuses de Tartarin de Tarascon,' an amusing satire on the boastfulness so characteristic of the south of France. From this time he published numerous works, some of the best being: 'Fromont Jeune et Risler Aîné' (1874); 'Jack' (1876); 'Le Nabab' (1877); 'Les Rois en Exil' (1879); 'Numa Roumestan' (1881); 'L'Évangéliste' (1883); 'Sapho' (1884); 'Tartarin sur les Alpes' (1885), a sequel to 'Les Aventures Prodigieuses'; 'Trente Ans à Paris' (autobiographical), (1887); 'Souvenirs d'un Homme de Lettres' (1889); 'Port Tarascon, dernières Aventures d'Illustre Tartarin' (1890); 'Rose et Ninette' (1892); 'La Mentreuse' (1893); 'Entre les Frises et la Rampe' (1894); 'La Petite Paroisse' (1895); 'Contes d'Hiver' (1896); 'L'Enterrement d'une Étoile' (1896); 'Les Mères' (1896); 'Le Trésor d'Arlatan' (1897); 'La Fédor' (1897); and 'Soutien de Famille' (1897). M. Daudet has often been compared with Dickens in his mastery of pathos and humor. Some of his principal works rely mainly on his great powers of caricature for their success. His chief works have been translated into English and in this dress have been very popular. See Brunetière, 'Le roman naturaliste' (1896).

Daudet, Ernest Louis Marie, èr-nā loo-ē mā-rē, French novelist: b. Nîmes 31 May 1837. He is a brother of Alphonse Daudet (q.v.). His most notable novels are: 'The Venus of Gordes'; 'The Bloom of Sin'; 'Martha.' He

DAUGHTER OF THE CONFEDERACY—DAUN

is author of an autobiographical sketch, 'My Brother and Myself' (1882); and has written some historical sketches, as a 'History of the Royalist Conspiracies in the South During the Revolution' (1881); 'History of the Emigration' (1886); 'Les Bourbons et la Russie pendant la Révolution Française' (1888).

Daughter of the Confederacy. See DAVIS, VARINA ANNE JEFFERSON.

Daughters of the American Revolution, a society composed of women who are descendants of ancestors, any of whom "with unflinching loyalty rendered material aid to the cause of independence as a recognized patriot, as soldier or sailor, or as a civil officer in one of the several colonies or States." It was organized in Washington, D. C., 11 Oct. 1890.

Daughters of the Confederacy, United, an association of the widows, wives, mothers, sisters, and lineal female descendants of men who served honorably in the army and navy of the Southern States, or who gave personal services to the Confederate cause. It was organized at Nashville, Tenn., 10 Sept. 1894.

Daughters of the Holland Dames, a colonial society of women, the official title being "The Daughters of Holland Dames, Descendants of the Ancient and Honorable Families of New York," was incorporated for the purpose of erecting a memorial to commemorate the early Dutch period of our colonial history, and to preserve and collect historical documents relating to the same. The headquarters are in New York. This society is not connected with the Holland Dames.

Daughters of the King, a Protestant Episcopal order of women (not to be confounded with the King's Daughters), organized in 1885. The aim of the society is to bring young women within the influence of the Church and to co-operate with the rectors of parishes to that end. President, Mrs. E. A. Bradley. The office of the council is in New York.

Daughters of the Revolution, a patriotic society of women in the United States, organized in 1891. Eligibility to membership is restricted to "women who are lineal descendants of an ancestor who was a military or naval or marine officer, soldier, sailor, or marine, in actual service under the authority of any of the 13 Colonies or States, or of the Continental Congress, and remained always loyal to such authority, or descendants of one who signed the Declaration of Independence, or of one who as a member of the Continental Congress or of the Congress of any of the Colonies or States, or as an official appointed by or under the authority of any such representative bodies, actually assisted in the establishment of American independence by service rendered during the War of the Revolution, becoming thereby liable to conviction of treason against the government of Great Britain, but remaining always loyal to the authority of the Colonies or States." There are numerous subordinate State organizations.

Daughters of 1812. See UNITED STATES—DAUGHTERS OF 1812, NATIONAL SOCIETY OF.

Daulatabad, dow-lāt-ā-bād' ("fortunate city"), India, a town and fort in the Deccan, within the Nizam's dominions, 28 miles north-

west of Hyderabad. The fortress consists of a conical rock, 600 feet high, with a wide ditch and an outer wall nearly three miles in circumference. The place surrendered to the Mohammedans in 1294, and Shah Muhammad Tughlak (1324-51) thrice attempted to remove the seat of government hither from Delhi. The fortress has not been garrisoned now for many years, and the town has greatly decayed. Pop. 1,243.

D'Aulnoy, dōl'nwā, Marie Catharine Jumelle de Berneville, zhu-mēl de bār-nē-vēl, COUNTESS, French writer: b. about 1650; d. 1705. She wrote many romances, long consigned to safe oblivion, but her fame rests securely on her 'Fairy Tales,' written in a simple, bright, and charming style, not altogether unworthy of Perrault. 'The White Cat,' the 'Yellow Dwarf,' 'Finette Cendron,' and 'Le Mouton' have for two centuries been naturalized in the nurseries of Europe, and are still familiar figures in pantomime. Her altogether delightful 'Travels in Spain' was reissued in New York in 1898.

Daumer, Georg Friedrich, gā'örg frēd-rīr dow'mēr, German writer: b. Nuremberg 5 March 1800; d. Würzburg 14 Dec. 1875. He underwent some remarkable revolutions of thought concerning religion; in his student days leaned strongly to Pietism; next was the declared foe of the Christian religion; and about 1859 embraced Catholicism and became one of its foremost champions. He wrote among many other philosophical tractates: 'Hints Toward a System of Speculative Philosophy' (1831); to his second period belongs: 'The Fire and Moloch Worship of the Hebrews' (1842); to his third: 'My Conversion' (1859). Of his poetical works, the 'Flowers of Song from Hafiz' may be named—a very beautiful transcription of the Oriental poet, with free variations in the very spirit of Hafiz himself. He wrote also 'Beautiful Souls: a Little Wreath of Legends and Poems' (1862); 'Legends and Poems of St. Mary.'

Daumier, Honoré, ô-nô-rā dô-mē-ā, French caricaturist: b. Marseilles 26 Feb. 1808; d. Valmondois 10 Feb. 1879. Fashion, titillation, scandal, politics, blemishes of figure, and oddities of character in turn inspired his inexhaustible genius for mockery. Few among his illustrious contemporaries escaped his pencil, and his caricatures had always some strikingly truthful feature about them. He made his debut in the 'Charivari,' in a series of sketches from 'Robert Macaire'; and the revolution of 1848 suggested two of his most remarkable series, 'Parliamentary Idylls' and 'The Representatives Represented.' In his old age Daumier became blind, and was befriended by Corot, the landscape painter. See Alexandre, 'Honoré Daumier, l'homme et son œuvre' (1890).

Daun, Leopold Joseph Maria, lā'ô-pôld yô'sēf mā-rē-ā down, COUNT VON, Austrian general: b. Vienna 25 Sept. 1705; d. 5 Feb. 1766. He served in the Turkish war in 1710; as major-general in Italy in 1734; and distinguished himself at the battle of Krozka in 1737, and the capture of Dingelfingen in 1740. In 1748, after serving against the French in the Netherlands, he was made Knight of the Golden Fleece. He

DAUPHIN — DAVENPORT

defeated Frederick the Great at Kolin in 1757, and again at Hochkirch in 1758.

Dauphin, dâ'fin, Fr. dō-fân, the title of the eldest son of the king of France. Dauphin was originally a title held by several of the feudal lords of France, and is believed to have originated from the dolphins (Fr. *dauphin*) worn on their helmets or used as a family crest. In 1349 Humbert II., dauphin of Viennois, being childless, transferred his estate, called the Dauphiny (*le Dauphiné*), in the south of France, to Philip of Valois, on condition that the eldest son of the king of France should in future be styled the dauphin, and govern this territory. The dauphin, however, retained only the title, the estates having been united with the crown lands. On the death of the dauphin his eldest son inherited this title; if he had no son his eldest brother succeeded him. If the king had no son, as was the case in the reign of Louis XVIII., the title of dauphin was not bestowed on any one; for it was never given to the next prince of the blood and presumptive heir, even if he were the king's brother. The wife of the dauphin was called dauphiness (*dauphine*). The *Delphin* classics were editions made for the use of the dauphin (*in usum delphini*).

Dauphiné, dō-fên-ā, one of the ancient provinces of France. It was divided into Upper and Lower Dauphiné. It forms the departments of the Isère, the Hautes Alpes, and part of that of the Drôme. The capital of the whole was Grenoble. The province constituted a sort of triangle, bounded north by Bresse and Savoie, east by Piedmont, south by Provence, and west by the Rhone.

Daurat, Jean, zhōn dō-rā, French scholar: b. about 1510; d. 1588. He became president of the College Coqueret, where he superintended the studies of Ronsard, Du Bellay, Baif, and Belleau. These poets he carefully trained for the task of reforming the vernacular, and ennobling French literature by the imitation of Greek and Latin models. He wrote nothing of importance in French, but devoted himself to guiding and stimulating the other members of the Pléiade, in whose works his learning and enthusiasm bore rich and enduring fruit.

Dauw, dâ, or **Peechi** (*Equus burchelli*), an animal closely resembling the zebra, which inhabits the plains of southern Africa, particularly to the north of the Orange River. It is about the size of an ass, but more delicately formed. Its general color is a pale brown, with grayish-white on the abdomen and inner parts of the limbs. Its head, neck, and body, and the upper parts of its limbs are striped like the zebra, but the stripes are not so dark in color. It migrates periodically in search of food, and in times of scarcity visits the cultivated lands and makes havoc of the crops. It has been tamed to some extent, but its temper cannot be relied on. The Dutch colonists call it Bonte-quagga. It is known also as Burchell's zebra. See ZEBRA.

Davao, dā-vā'ō, Philippines, a province in the southeastern part of the island of Mindanao; area 8,976 square miles; with dependent islands 9,171 square miles. Most of the communication between towns and villages is by sea, as almost all are on the coast; there are a few roads, and the United States troops have done

much to improve them. Hemp, coffee, tobacco, rice, and corn are cultivated; the cinnamon tree, the betel nut, cloves, and nutmeg grow without cultivation; large numbers of horses, cattle, and hogs are raised. There are indications of deposits of coal and some gold, and there are many valuable forests. Davao was occupied by United States troops in December 1899, and was given civil government in 1903.

Dav'enant, SIR William, English poet and dramatist: b. Oxford February 1606; d. London 7 April 1668. He was employed in preparing several masques for the entertainment of the court; and on the death of Ben Jonson in 1637, succeeded to the vacant laurel. On hostilities breaking out between Charles I. and the Parliament, Davenant displayed his attachment to the royal cause. At the siege of Gloucester in 1643, he was knighted by the king; and on the decline of the royal cause retired to France, where he became a Roman Catholic, and began the composition of his principal work, a heroic poem, entitled 'Gondibert.' An attempt which he afterward made to lead a French colony to Virginia had nearly proved fatal to him. The ship in which he had sailed from Normandy was captured by a cruiser in the service of the English Parliament, and carried into the Isle of Wight, where Davenant was imprisoned in Cowes Castle. In this forlorn captivity, from which he had but little hope of escaping alive, he composed the third book of 'Gondibert.' In October 1650 he was removed to London for trial before the high commission court. His life is said to have been preserved by the interposition of Milton. There is a corresponding tradition, that Davenant repaid the good offices of Milton by protecting the republican poet after the Restoration. On the return of Charles II. to England the stage was re-established with renewed splendor, and Davenant became patentee of a theatre in Lincoln's Inn Fields. He continued to employ his pen and his talents as a theatrical writer and manager till his death. He was buried in Westminster Abbey. His works consist of dramas, masques, addresses, and the epic 'Gondibert,' which was never finished; but he is remembered chiefly by the reconstruction of Shakespeare's 'Tempest,' in which he was engaged along with Dryden, a work which long held the stage in place of the original, although unequivocally condemned by modern criticism as a vulgar and degraded version of a drama which stood in need of no such emendation.

Dav'enport, Charles Benedict, American zoologist: b. Stamford, Conn., 1 June 1866. He was graduated from Harvard in 1889; is a director of the biological laboratory of the Brooklyn Institute of Arts and Sciences, and in 1899 was appointed professor of zoology at the University of Chicago. He has written: 'Experimental Morphology' (1897-9); 'Statistical Methods in Biological Variation' (1899); and 'Introduction to Zoology' (with G. C. Davenport, 1901).

Davenport, Cyril James, English librarian: b. Stirling, Scotland, 5 June 1848. He has been a librarian in the British Museum since 1868 and has published: 'The English Regalia' (1897); 'Royal English Bookbindings' (1897); 'Cantor Lectures on Decorative Bookbindings'

DAVENPORT

(1898); 'English Embroidered Bookbindings' (1899); 'Cantor Lectures on Cameos' (1900); 'Life of T. Berthelet' (1900); 'Personal Jewellery' (1902).

Davenport, Edward Loomis, American actor: b. Boston 15 Nov. 1814; d. Canton, Pa., 1 Sept. 1877. His first appearance was made in 1836 at Providence, R. I., as Parson Will in 'A New Way to Pay Old Debts,' with Junius Brutus Booth as Sir Giles. In 1838 he played in Philadelphia. He soon became a leading performer in comedy, melodrama, and tragedy. Up to 1847 he appeared chiefly in Boston. In that year he went to England with Mrs. Mowatt, there playing Claude Melnotte in 'The Lady of Lyons,' with Mrs. Mowatt as the Pauline. For two seasons he supported W. C. Macready. In 1854 he returned to the United States, where he traveled extensively, playing especially Shakespearean parts and those in dramatizations of Dickens. As Brutus in 'Julius Caesar' and Bill Sykes in 'Oliver Twist' he was equally successful. Among his other characters were Sir Giles Overreach and Hamlet. In 1859 he became manager of the Howard Athenæum, Boston, in 1869 of the Chestnut Street Theatre, Philadelphia. His versatility and finish were notable. Consult Edgett, 'E. L. Davenport' (1901; Dunlap Society Pub., new series, No. 14).

Davenport, Eugene, American agriculturist and educator: b. Woodland, Mich., 20 June 1856. He was professor of agriculture in the Michigan Agricultural College in 1889-91, and president of the agricultural college at São Paulo, Brazil, in 1891-2. In 1895-1901 he was professor of animal husbandry in the University of Illinois. In September 1901 he became dean of the College of Agriculture of that institution, director of the Agricultural Experiment Station, and professor of thremmatology. He has contributed to the agricultural press and the bulletins of the experiment stations of Illinois and Michigan.

Davenport, Fanny Lily Gypsy, American actress: b. London 10 April 1850; d. Duxbury, Mass., 26 Sept. 1898. Her first appearance on the stage was at the Howard Athenæum in Boston, then under the management of her father, E. L. Davenport (q.v.). She played during her career in the theatres of all the large cities in the United States. Her most noted roles were in 'La Tosca,' 'Giaconda,' 'Fedora,' and 'Cleopatra.' She was married in 1879 to Edwin H. Price, but was divorced and subsequently married Melbourne McDowell, an actor of leading roles in her company.

Davenport, Franklin, American legislator: b. Philadelphia, Pa.; d. Woodbury, N. J., about 1829. He studied law, and, having been admitted to the bar, practised at Woodbury, N. J. In the Revolution he was a captain of artillery in Newcomb's New Jersey brigade, and also stationed at Fort Mifflin. In 1794, at the time of the "Whiskey Insurrection," he marched with the troops to Pittsburg as colonel of the New Jersey line. He was appointed United States senator to fill a vacancy, serving in 1798-9, and was a representative in Congress in 1799-1801.

Davenport, Herbert Joseph, American educator and publicist: b. Wilmington, Vt., 10

Aug. 1861. He was educated at the University of South Dakota, and the Harvard Law School, and is now (1903) principal of the high school at Lincoln, Neb. He has published: 'Outlines of Economic Theory' (1896); 'Elementary Economic Theory' (1898); 'Principles of Grammar' (with Emerson, 1898).

Davenport, Henry Kallock, American naval officer: b. Savannah, Ga., 10 Dec. 1820; d. Franzensbad, Bohemia, 18 Aug. 1872. He entered the navy in 1838, and in 1844, as passed midshipman, became connected with the coast survey. In 1849-53 he was in the mail-steamship service, subsequently was on sea duty with various squadrons, and in 1856 participated in the capture of the Barrier forts, Canton River, China. During the Civil War he commanded the steamer Hetzel in 1861-4, being in 1862-4 senior officer in command of the sounds of North Carolina. Promoted captain in 1868, he was assigned to the command of the Congress of the European squadron in 1870.

Davenport, Homer Calvin, American artist and cartoonist: b. Silverton, Ore., 8 March 1867. Without schooling or art education, and after many vicissitudes as jockey, circus clown, and railroad stoker, he was employed by the San Francisco *Examiner* in 1892 and since then has been engaged upon the staff of the *American and Journal*, the *World*, and the *Evening Mail* of New York. He has also appeared as a lyceum lecturer. He has published: 'Davenport's Cartoons'; 'The Bell of Silverton, and Other Short Stories of Oregon'; 'The Dollar or the Man.'

Davenport, Ira, American politician: b. Hornellsville, N. Y., 28 June 1841. After graduating from Yale College he went into business and in 1877 was elected to the New York senate and re-elected in 1879. During both terms he served as chairman of the committee on commerce and navigation. He was elected comptroller of the State of New York in 1881, and after retiring from that office served two terms as member of Congress. He was the Republican candidate for governor of the State of New York in 1885, but was defeated by D. B. Hill, since which time he has retired from politics.

Davenport, John, American Puritan clergyman: b. Coventry, England, 1597; d. Boston, Mass., 15 March 1670. Educated at Oxford, he became chaplain of Hilton Castle, near Durham, later was made minister of Saint Stephen's Church, London (1616-33), and there attained a considerable reputation as a preacher. His Puritanical principles and views ere long brought him into conflict with Archbishop Laud, and in 1633 he withdrew from the English Church, and removed to Holland, where he became colleague of the Rev. John Paget, pastor of the Puritan church at Amsterdam. In 1636, however, he returned to England, where he was very active in obtaining the charter of the Massachusetts colony. He arrived in Boston in June 1637, sat with the synod of Cambridge in August, and in March 1638 sailed with the band of colonists that founded New Haven (Quinnipiac). Here he was extremely influential in civil as well as ecclesiastical affairs. He was minister there for 30 years, and aided in establishing the system of civil polity, which began by the declaration that "all of them would be ordered by the rules which

the Scriptures held forth to them." On 4 June 1649, holding their constituent assembly in a barn, the "free planters" resolved that church members only should be burgesses, and Davenport was chosen one of the "seven pillars" to support the ordinance of civil government. He exhorted the governor to judge justly, and the "cause that is too hard for you to bring it to me." Annual elections were ordained, and God's word established as the only rule in public affairs. In his carefulness in regard to the admission of members to the Church, he held in reality also the keys of all political power. When the messengers of the king, who had come to New England in pursuit of Goffe and Whalley, the regicide judges of Charles I., approached New Haven, he hid the fugitives in his house, and preached to his congregation from Isaiah xvi. 3 and 4: "Hide the outcasts: bewray not him that wandereth. Let mine outcasts dwell with thee, Moab: be thou a covert to them from the face of the spoiler." After the death of Wilson, the pastor in Boston, in 1667, he removed there to succeed him. He was installed in December 1668. His election caused a division in the congregation. Those who opposed his views on the "half-way covenant" withdrew and organized the Old South Church. The controversy went on for many years. Among his publications are: 'Discourse About Civil Government in a New Plantation Whose Design is Religion' (1663); 'The Knowledge of Christ Indispensably Required of All Men Who Would be Saved' (1653); 'A Catechism Containing the Chief Heads of Christian Religion' (with Hooke 1659); 'The Saints' Anchor-Hold' (1661); 'The Power of Congregational Churches Asserted and Vindicated' (1672). He was also an editor of the works of Dr. John Preston, for some time leader of the English Puritans. Consult: Mather, 'Magnalia' (1702), and Dexter, 'Sketch of the Life and Writings of Davenport' ('Papers' of the New Haven Colony Hist. Soc., Vol. II., 1877).

Davenport, Robert, English poet and dramatist: flourished about 1623; d. after 1640. He is known only through his 'A Crowne for a Conqueror, and Too Late to Call Backe Yesterday. Two Poems, the One Divine, the Other Morall' (1623); 'King John and Matilda' (1655), a tragedy; and two comedies: 'A New Trick to Cheat the Divell' (1639), and 'The City Night Cap' (printed 1661). That he was associated with Shakespeare in producing parts 1 and 2 of 'Henry VI.' seems established, and it is almost certain that he is the author of a play called 'The Pirate.'

Davenport Brothers. IRA E. (b. 1839) and WILLIAM H. (b. 1841). So-called "mediums," who professed to be adepts in spiritistic arts, and who, by their skill in performing various feats and their clever deceptions gained many followers. They flourished in 1845-65, but were finally exposed as impostors. Consult Abbot, 'The Davenport Brothers' (1864) and Barkas, 'Lecture on the Brothers Davenport' (1864). See SPIRITUALISM.

Davenport, Ia., a city of Scott County, of which it is the county-seat, on the western bank of the Mississippi, opposite Rock Island, Ill., 330 miles above Saint Louis, and 184 miles west by south of Chicago; on the Burlington, Cedar

Rapids & Northern, the Chicago, Milwaukee & Saint Paul, the Chicago, Rock Island & Pacific, and other railways. It is pleasantly situated at the foot of the Upper Rapids of the Mississippi, on the slope of a steep bluff which extends for 3 miles along the river and commands an extensive view. It is connected with the Illinois shore by an iron railway and carriage bridge, built in part by the Federal government, and costing \$1,200,000, and an iron railway bridge costing \$800,000. On Rock Island, which is crossed by the former structure, are the central United States arsenal and armory, military headquarters, and other government buildings.

Industries, etc.—The census of 1900 shows 416 establishments here, with a capital of \$10,774,707, employing an average number of 4,348 persons at wages amounting to \$1,892,737; cost of materials used, \$6,854,677; value of products, \$11,573,670. The surrounding region is important both agriculturally and for its coal mines. Davenport ships large quantities of farm produce, river-packets from Saint Paul to Saint Louis furnishing means of transportation in addition to that of the railways. The flour and grain business is an important one. Among the numerous manufactured products are lumber and planing-mill products, brick and stone, bread and other bakery products, carriages and wagons, agricultural implements, woolen goods, glucose and its products, foundry and machine-shop products, cordage, pottery, furniture, cigars, and cooperage products. Wholesale slaughtering and meat-packing is also carried on here.

Public Institutions, Buildings, etc.—Davenport has an Academy of Natural Sciences, the organization having been begun 14 Dec. 1867; Saint Luke's, Mercy, and other hospitals; a public library; two opera-houses; a Masonic temple, and other important buildings. It is the seat of Saint Ambrose College and other educational institutions, and of the State Orphanage; and it is an episcopal see of the Roman Catholic Church and the Protestant Episcopal Church. The Academy of Natural Sciences regularly publishes 'Proceedings,' and has a large scientific library and a fine collection of mound-builder relics.

History, Government, etc.—Davenport was founded in 1835, in the autumn of which year a company, led by Col. George Davenport, long a resident on Rock Island, was formed for the purchase of a site. In 1838 it was incorporated as a town, and in 1851 a city charter was obtained from the legislature and adopted. The Chicago & Rock Island Railway was chartered in 1851 and completed in February 1854. The government is by a mayor, biennially elected, and a city council, comprising the mayor and aldermen elected by wards and at large. The annual income is about \$540,000; the expenditure is \$500,000. Pop. (1890) 26,872; (1900) 35,254.

Davey, Richard Patrick Boyle, English journalist: b. 1848. He began his career in 1870 in New York, where he edited 'The Spirit of the Times'; and returning to England in 1880 has since been connected with various London journals as literary and dramatic critic. He has published: 'Sand Sea'; 'A Royal Amour' (1881); 'Weatherleigh' (1894); 'The Sultan and His Subjects' (1895); 'Victoria: Queen and Empress' (1897); 'Mary Tudor' (1898);

DAVID

'Cuba: Past and Present' (1898); 'Life of Lady Jane Grey' (1902); 'Historical London' (1902); 'Lucrezia Borgia' (1903). He is also the author of the plays: 'Paul and Virginia' (1886); 'Lesbia' (1889); 'Inheritance,' produced in New York and played 1,500 times; 'St. Ronan's Well' (1893); 'Marion de l'Orme' (1894); and has lectured both in England and the United States.

David (Heb. "beloved"), king of Israel. He was the youngest son of Jesse, a citizen of Bethlehem, and member of the tribe of Judah. His life is recorded in the first and second books of Samuel and the first book of Chronicles. The book of Psalms, a large portion of which was composed by him, also contains frequent allusions to incidents in his life, evidently introduced for allegorical purposes, and often supposed to apply prophetically to the Messiah, of whom David was an ancestor. During Saul's life, and in consequence of his disobedience to the divine commands, the prophet Samuel was sent to anoint David, who then kept his father's flocks as king of Israel. David was afterward recommended to Saul for his skill in music, and played before him to soothe a melancholy distemper to which the king was subject. On the breaking out of war he was sent home, but being sent by his father to inquire after his brothers in the army he slew Goliath, a Philistine giant, who had defied the armies of Israel. Saul again took him to court, but exhibited extreme jealousy of him, and frequently tried to kill him. David escaped through the connivance of Jonathan, Saul's eldest son, who had formed a strong attachment for him. He now became the master of a band, composed in great part of lawless characters, but whom he seems to have disciplined and kept in subordination. He was pursued and persecuted by Saul during a great part of the remainder of that monarch's life. On the death of Saul he was crowned king of Judah at Hebron, and seven years afterward, at the close of a successful war with Ishbosheth, Saul's successor, was acknowledged king of all Israel. He reigned after this for 33 years, extending the dominions of the kingdom of Israel by conquests over the Philistines, Amalekites, Edomites, Moabites, Ammonites, and Syrians. Although generally a just and merciful prince, he committed an act of great oppression in taking possession of the wife of Uriah, one of his officers, and directing Joab, the captain of the host, to abandon Uriah at the siege of Rabbah, and permit him to be killed. For this the prophet Nathan predicted great calamities to his family and kingdom, and it was soon followed by the rebellion and death of his favorite son Absalom. Another of his sons, Adonijah, rebelled near the close of his reign. David's penitence for this offense is expressed in several beautiful psalms. He was succeeded by Solomon, his son by Bathsheba, the wife of Uriah. David made great preparations for the building of a temple at Jerusalem, which he had conquered from the Jebusites, but the work was by divine command transferred to his son Solomon, by whom it was carried out. David was born, according to Ussher, 1085 B.C., anointed king 1063, made king of Judah 1055, of Israel 1048, died 1015. Some modern authorities place his death earlier, others later. See **PSALMS**.

David, Saint (Welsh, *Dewi*), patron saint of Wales; d. 601. He was archbishop of Caerleon and afterward of Menevia, now Saint David's. He was celebrated for his piety, and many legends are told of his miraculous powers. Several theological treatises are ascribed to him.

David I. (often called **St. David**), king of Scotland; b. about 1080; d. Carlisle, England, 24 May 1153. He succeeded his brother, Alexander the Fierce, in 1124. He married Maud, grandniece of William the Conqueror; and was Earl of Northumberland and Huntingdon when called to the Scottish throne. On the death of Henry I., king of England, he maintained the claim of his daughter Maud against King Stephen, and seized Carlisle, but was defeated at the battle of Northallerton in 1138.

David II., king of Scotland; b. Dunfermline, Scotland, 5 March 1324; d. Edinburgh 22 Feb. 1371. He was the son of Robert Bruce (q.v.), and succeeded to the throne in 1329. On the death of his father he was acknowledged by the great part of the nation. Edward Baliol, however, the son of John Baliol, formed a party for the purpose of supporting his pretensions to the crown; he was backed by Edward III. of England. Battles were frequent, and at first Baliol was successful; but eventually David succeeded in driving him from Scotland. Still, however, the war was carried on with England with increasing rancor, till at length David was made prisoner at the battle of Neville's Cross (1346). After being detained in captivity for 11 years he was ransomed for 100,000 marks. The remainder of his reign was occupied in disputes with his parliament.

David, Armand, *är'män dä-vêd*, French abbé, naturalist, and missionary; b. Espelette 7 Sept. 1826. He entered the congregation of the Lazarists in 1848, teaching the natural sciences for some time at Savone, and going, in 1862, to China, where he made an enormous collection of plants, minerals and animals, which he sent to the museum in Paris. In 1866 he undertook a new exploration, chiefly through Mongolia and eastern Tibet. In 1872 he made a third voyage to China, lasting two years. Besides the accounts of his journeys, appearing in the archives of the Museum under the title of 'Journal of My Third Voyage of Exploration in the Chinese Empire' (1875), he left many works on natural history, among which are: 'The Birds of China,' and 'Plantæ Davidianæ ex Sinorum Imperio' (1890).

Da'vid, Christian, Moravian missionary; b. Sinfleben, Moravia, 31 Dec. 1690; d. Herrnhut 3 Feb. 1751. In 1722 he was the leader of the Moravians who took refuge from persecution with Count Zinzendorf and founded their settlement at Herrnhut. In 1733 he went to Greenland, establishing the first mission there; he later made several visits to Greenland, as well as missionary journeys to Denmark, Holland, Livonia, and England.

David, *dä-vêd*, **Félicien Cesar**, French musician and composer; b. Cadenet, Vaucluse, 13 April 1810; d. Saint Germain, near Paris, 29 Aug. 1876. After some vicissitudes he entered the Paris Conservatoire in 1830, and became an ardent disciple of St. Simon, *Enfantin*, and other social speculators. In 1832, with a

few companions, he went to the East in order to realize his dreams of a perfect life, but returned disappointed in 1835. He then published his 'Mélodies Orientales,' and soon after his most successful work, the ode-symphony 'Le Désert' (1844). His other works include many compositions for strings and for the pianoforte, and 'Moïse sur le Sinai' (1846); 'Christophe Colomb' (1847); 'L'Eden' (1848); 'La Perle du Brésil' (1851); 'Herculeum' (1859); and 'Lalla Rookh' (1863). His work abounds in felicitous and melodious expression, and is pre-eminently marked by the qualities characteristic of French music.

David, dā'vêd, Ferdinand, German violinist: b. Hamburg 19 Jan. 1810; d. Kloster, Switzerland, 18 July 1873. He was a pupil of Spohr; made his début in 1824; and was leader of Gewandhaus Concerts, Leipzig 1836. His works, which reach Opus 39, are principally for the violin. He was the friend of Mendelssohn and the teacher of Joachim and Wilhelmj.

David, Gheerardt, gā-rārt' dā'vêd, Dutch painter: b. Oudewater about 1460; d. Bruges 13 Aug. 1523. In 1484 he entered the Painters' Guild of Bruges, of which he became dean in 1501. The National Gallery, London, contains an admirable example of his work in 'A Canon and His Patron Saints,' a wing from an altarpiece; and among his other pictures are a 'Madonna,' in the museum at Rome; a 'Crucifixion,' in Berlin; and a 'Baptism of Christ,' and a 'Descent from the Cross,' both at Bruges. See Conway, 'Early Flemish Artists' (1887).

David, Jacques Louis, zhāk loo-ê dā'vêd, French painter: b. Paris 30 Aug. 1748; d. Brussels 29 Dec. 1825. After obtaining the grand prize in Paris he studied in Rome from 1775 to 1780, devoting himself particularly to historical painting. He visited Rome a second time in 1784, and finished his masterpiece, the 'Oath of the Horatii,' which Louis XVI. had commissioned him to design from a scene in the Horaces of Corneille. In the same year he painted his 'Belisarius'; in 1787, the 'Death of Socrates'; and in 1788, 'Paris and Helen.' He finished, in 1789, a large painting representing Brutus condemning his sons to death. He also furnished the designs of the numerous monuments and republican festivals of that time. In 1792 he was chosen an elector in Paris; afterward a deputy in the National Convention; and during the Reign of Terror was one of the most zealous Jacobins, and wholly devoted to Robespierre. He proposed to erect a colossal monument of the nation on the Pont-Neuf, from the materials of the king's statue. At the trial of Louis XVI. he voted for his death. In 1799 he executed the 'Rape of the Sabine Women,' from the exhibition of which he received, as it is said, 100,000 francs. In 1804 the emperor directed him to execute four pieces, among which the coronation of Napoleon was particularly distinguished. Among his finest works of this period were many representations of the emperor, particularly that in which Napoleon was represented on horseback, on Mount St. Bernard, pointing out to his troops the path to glory. This is often engraved. In 1814 David painted 'Leonidas,' his last painting in Paris. After the second restoration of Louis XVIII. he was included in the decree which banished all regicides from France. He then es-

tablished himself at Brussels, where he died in exile. The opinions of the merits of this artist are various, but the praise of correct delineation and happy coloring is universally conceded to him. He found in the history of his time, in the commotions of which he took an active part, the materials of his representations. See Mather, 'History of Modern Art' (Vol. II. 1896); Stranahan, 'History of French Painting' (1899).

Da'vid, Laurent Olivier, Canadian journalist and author: b. Sault au Recollet, Quebec, 24 March 1840. He was educated at the College of Sainte Thérèse, and was admitted to the bar in 1864. He assisted in founding the paper 'Le Colonisateur,' 'L'Opinion Publique,' and the 'Le Bien Publique.' In the latter he attacked the Roman Catholic clergy for their interference in political matters. In 1886 he was elected to the Canadian legislature from East Montreal, but declined re-nomination in 1890. He has written: 'Biographies et Portraits' (1876); 'Les Héros de Chateaugay' (1883); 'Les Patriotes de 1837-8' (1884); 'Les Deux Papineau' (1896); and 'Le Clergé Canadien: sa mission et son œuvre' (1896).

David, Pierre Jean, pē-ār zhōn, French sculptor: b. Angers 1789; d. 5 Jan. 1856. He is commonly called **DAVID D'ANGERS**. He became the pupil of J. L. David (q.v.), and his bas-relief of Epaminondas having gained the first prize for sculpture in 1811, he was enabled to go to Rome to perfect himself in his art. On his return to Paris he laid the foundation of his fame by a colossal statue of the great Condé in marble. In August 1826 he was nominated a member of the Academy of Fine Arts, and in December of the same year professor in the School of Painting and Sculpture. He executed busts of Goethe for Weimar, of Schelling for Munich, of Tieck for Dresden, of Rauch and Humboldt for Berlin. In 1831 he began the magnificent sculptures of the Pantheon, his most important work, which he finished in 1837. He executed a great number of medallions, busts, and statues of celebrated persons of all countries, among whom may be named Walter Scott, Canning, Washington, Lafayette, Guttenberg, Cuvier, Victor Hugo, Béranger, Paganini, and Madame de Staël. David worked with great rapidity and ease, and his chief strength consisted in his facility of invention and execution, especially in large works. In works of smaller size his drawing and modeling are seen to be deficient in fineness and accuracy.

David, dā'vêth', Colombia, South America, situated on the Isthmus of Panamá, in a fertile plain on the Rio David which enters the Pacific eight miles to the south. Stock-raising and the cultivation of tobacco are extensively engaged in, and there is a considerable trade. Pop. 9,000.

David Ap Gwilym, dā'vêd āp gwêl'im, Welsh poet of the 14th century. There is a doubt about his dates, some authorities giving 1340-1400; others 1300-68. He had a good education and considerable knowledge of Italian and Latin. His tendency to keen satire was very unpleasant to his kinsmen and neighbors, and he was at one time forced to leave home on this account. To Morvydd, the lady whom he loved, he addressed nearly 150 poems; though she returned the poet's love she was forced into an

DAVID CITY—DAVIDSON

uncongenial marriage with a wealthy man. David eloped with her, and the fine imposed on him by the husband was so heavy that he could not have paid it but for the assistance of the men of Glamorganshire. Over 250 of his poems were collected and published by Owen Jones (1789); and a translation published by Arthur James Johnes (1834). Others of his poems have been discovered in manuscript.

David City, Neb., the county-seat of Butler County; situated on the Union P., the B. & M., the F. E. & M. V. R.R.'s, and about 45 miles northwest of Lincoln, the capital of the State. It is a trade centre for the populous agricultural region surrounding the city. Pop. 2,000.

David Balfour; Being Memoirs of His Adventures at Home and Abroad, a novel by Robert Louis Stevenson, published in 1893. A sequel to 'Kidnapped,' this novel opens with the attempt of David Balfour to effect the escape of his friend, Alan Stewart, from Scotland; and to aid Stewart's brother, unjustly imprisoned on a charge of murder. He falls in love with Catriona Drummond, is imprisoned, and after his release goes to Holland, where he lives with Catriona without marriage. Her father interfering, the two are separated; but by the intervention of Alan Stewart they meet again and are married. The novel is in the romantic vein, written with Stevenson's simplicity and clearness, and is artistic in construction.

David Copperfield, a novel by Charles Dickens, which was that author's favorite among his works, and was partly autobiographical in character. It is ranked among the greatest English novels. The hero's career is given from the day of his birth. At 10, he runs away from home, having been forced by a harsh stepfather to undertake rough daily work. He is adopted by his aunt, Miss Betsy Trotwood, an eccentric but kindly woman; and finally becomes an author. After the death of his "child wife," Dora Spenlow, he marries Agnes Wickfield, an almost ideal character.

Davidge, William Pleater, American actor: b. London, England, 17 April 1814; d. Cheyenne, Wyo., 7 Aug. 1888. He made his first appearance on the stage at the Drury Lane Theatre in London; after acting in various places in England, came to the United States in 1850. He took the part of Sir Peter Teazle at the old Broadway Theatre in New York, supported Forrest and other leading actors and took part in the Shakespearean revivals at the Winter Garden Theatre in 1867. In 1869-77 he was at Daly's Fifth Avenue Theatre; in 1879 he appeared as the original Dick Deadeye in 'Pinafore'; and in 1885 he became a member of the Madison Square Theatre Company. He played over 1,000 parts, among them Harcastle in 'She Stoops to Conquer'; Croaker in 'Good Natured Man'; Caliban in 'The Tempest'; Nick Bottom in 'A Midsummer Night's Dream'; and Old Gobbo in 'The Merchant of Venice.'

Davidists, the name given to two distinct religious sects, namely, the followers of David of Dinant in the 13th century, and those of David George or Joris in the 16th. David of Dinant was a contemporary of Almaricus of Bena (Amaury de Bène), and at the death of

Amaury (1204) continued to teach Amaury's pantheistic doctrine, founded on Neoplatonism, that the "All is God." David taught that holiness is simply the consciousness of the presence of God, the thought that God is the "One and the All": that he who attains the perfect view of the God-All cannot sin, no matter what enormities he commits; he is the Christ, he is the Holy Ghost. The other sect of Davidists, called also David-Georgians, after the name of their founder, who was born at Delft in 1501, had its rise in 1534. Its founder published in 1542 his 'Book of Wonders,' recounting his marvelous visions and divine revelations. But he retired from the leadership in 1544, and during the remainder of his life was a prosperous merchant at Basel, under an assumed name. By order of the senate of Basel, his body, as that of a heretic, was exhumed and burnt. The sect, with Henry Nicolas as its head, made progress in Holland and got a footing in England, being now known as Familists. The Familists taught as their chief tenet the gospel of love, divine love. Love, they held, is above all laws, whether ceremonial, moral, or civil, and the practice of the sectaries was so consonant with this doctrine that early in the 17th century the societies of Familists had to be suppressed in both countries, by the civil power.

Davids, Thomas William Rhys, English Oriental scholar: b. Colchester 12 May 1843. He was educated at the University of Breslau; from 1866 on filled judicial places in Ceylon and acted as archaeological commissioner. In 1877 he was called to the London bar, and subsequently became professor of Pali and Buddhist literature in University College, London. Among his works are: 'Buddhism' (1877); translations of 'Buddhist Birth Stories' (1880); 'Buddhist Suttas' and 'Vinaya Texts' (1891), published in 'The Sacred Books of the East'; 'American Lectures' (1896); 'Sacred Books of the Buddhists; Dialogues of the Buddha' (1899); 'Buddhist India' (1902).

David's Deer (*Corvus davidianus*), a deer found in northern China and in Manchuria. It derives its name from Père David, a French Catholic missionary, who first saw it in the imperial park at Peking. It resembles the Indian swamp-deer (q.v.), but has long, shaggy hair. It has no brow-tine. Little is known of its wild habits, for most of the representatives are found in parks and preserves in China or in Europe.

Davids Island, an island owned by the United States government and used for military purposes. It is in the waters of Long Island Sound, about 80 rods north of the limits of New York. Area about 100 acres.

Davidson, George, American astronomer: b. Nottingham, England, 9 May 1825. He came to the United States in 1832; graduated at the Central High School, Philadelphia, in 1845; and joined the United States Coast Survey. While in this service he was chief engineer of a party which surveyed a ship canal route across the Isthmus of Darien. He also made a geographical survey of the coast of Alaska in 1867. He traveled extensively in Egypt, China, India, and Europe, for purposes of scientific study, and also took charge of the telegraph-longitude work, and of the main triangulation and astronomical party carrying the geodetic work

DAVIDSON

across the continent. From 1877-84 he was regent of the University of California, and for many years was president of the California Academy of Sciences. He retired from the coast survey after 50 years of distinguished service, in 1895, and became professor of geography in the University of California.

Davidson, James Wheeler, American consul: b. Austin, Minn., 14 June 1872. He was a member of the Peary Arctic expedition to North Greenland 1893-4; war correspondent with the Chinese army 1895; and with the Japanese army 1895-6. In June 1898 he was appointed United States consul for Formosa and Loochoo Islands. He has published: 'Formosa Campaign and Its Future' (1896); 'The Island of Formosa: Past and Present' (1900).

Davidson, James Wood, American author: b. Newberry County, S. C., 9 March 1829. He was graduated from South Carolina College (now the State University) and taught Greek at the Mount Zion Collegiate Institute. During the Civil War he fought in the Confederate army as adjutant in Stonewall Jackson's army corps under Lee in Virginia. After the war he took up journalism, living in New York and Washington, and since 1887 has been in the Treasury Department at Washington. He has written: 'The Living Writers of the South' (1869); 'A School History of South Carolina'; 'The Correspondent' (1886); 'The Poetry of the Future' (1888); and 'The Florida of Today' (1889).

Davidson, John, Scottish poet, novelist, and miscellaneous writer: b. Barrhead, Renfrewshire, 11 April 1857. He was at first a teacher, but in 1890 went to London and adopted a literary career, writing for the 'Speaker' and other journals. He has published: 'Fleet Street Eclogues' (1893); 'A Random Itinerary' (1894); 'Ballads and Songs' (1894); 'Plays' (1894); 'Earl Lavender' (1895); 'New Ballads' (1896); 'The Last Ballad and Other Poems' (1898); 'The Testament of a Man Forbid' (1901); 'The Testament of an Empire Builder' (1902); and two novels: 'Perfervid' (1890); and 'Baptist Lake' (1894).

Davidson, John Wynn, American soldier: b. Fairfax County, Va., 18 Aug. 1824; d. St. Paul, Minn., 26 June 1881. He was a graduate from West Point in 1845; served during the Mexican war in the Army of the West, was then placed on frontier and garrison duty, and fought a battle against the Apache and Utah Indians at Cienguilla, N. Mex., in 1854, in which he lost three fourths of his command. He served in the Federal army during the entire Civil War, and in 1866 became lieutenant-colonel in the United States cavalry. He was professor of military science at the Kansas Agricultural College, and commanded various posts in Idaho, Texas, etc.

Davidson, Lucretia Maria, American poet: b. Plattsburg, N. Y., 27 Sept. 1808; d. there 27 Aug. 1825. She was remarkably precocious, and at the age of nine years wrote her first poem, 'Epitaph on a Robin.' In 1829 S. F. B. Morse collected and published her writings under the title 'Amir Khan and Other Poems.'

Davidson, Margaret Miller, American poet: b. Plattsburg, N. Y., 26 March 1823; d. Saratoga, N. Y., 1838. She was sister of L. M.

Davidson (q.v.), and began to write at the age of six years. Her poems surpass those of her sister in fervor of sentiment, and flight of imagination. They were published after her decease, with a memoir written by Washington Irving, and met with warm applause both in the United States and England.

Davidson, Samuel, Irish biblical scholar: b. near Ballymena, Ireland, 1807; d. 1 April 1898. After entering the ministry of the Presbyterian Church, he became in 1835 professor of biblical criticism and literature in the Presbyterian Theological College in Belfast. He afterward joined the Congregationalists, and was appointed, in 1842, professor of biblical literature and Oriental languages in their college at Manchester, but had later to resign this post owing to his too advanced opinions on theological questions. His works include: 'Sacred Hermeneutics' (1843); 'Translation of Geseler's Ecclesiastical History' (1846); 'The Ecclesiastical Polity of the New Testament' (1848); 'An Introduction to the New Testament' (1848-51); 'Biblical Criticism' (1852); 'Introduction to the Old Testament' (1862); 'Translation of Fürst's Hebrew Lexicon'; 'On a Fresh Revision of the English Old Testament' (1873); 'The New Testament Translated from the Critical Text of Von Tischendorf' (1875); 'Canon of the Bible' (1877); and 'Doctrine of Last Things Contained in the New Testament' (1883).

Davidson, Thomas, Scottish philosopher and writer: b. Aberdeenshire 25 Oct. 1840; d. Montreal 14 Sept. 1900. He came to the United States in 1867, and was subsequently professor of classics in the St. Louis High School. In 1875 he settled in Cambridge, Mass. Later he traveled in Greece and Italy, where much of his literary work was perfected. Included in his publications are: 'A Short Account of the Niobe Group' (1874); 'The Place of Art in Education' (1886); 'Giordano Bruno, and the Relation of His Philosophy to Free Thought' (1886); a 'Hand-Book to Dante, from the Italian of Scartazzini, with Notes and Additions' (1887); 'Prolegomena to Tennyson's "In Memoriam"'; 'Aristotle and Ancient and Modern Educational Ideals'; 'The Education of the Greek People and Its Influence on Civilization.'

Davidson, William, American general: b. Lancaster County, Pa., 1746; d. Cowan's Ford, N. C., 1 Feb. 1781. He took up arms at the outbreak of the Revolution, was major of one of the first regiments raised in Carolina, was appointed brigadier after the battle of Camden, and in 1781 was despatched by Greene to prevent Cornwallis from passing the Catawba at Cowan's Ford. With his death in the battle which ensued, and with the dispersion of his troops, began the pursuit of Greene by Cornwallis.

Davidson, William Leslie, Scottish logician: b. Meikle Wartle, Aberdeenshire, 25 May 1848. He was educated at Aberdeen University, where he has been professor of logic and metaphysics from 1895. He is the author of 'The Logic of Definition' (1885); 'English Words Explained' (1886); 'Theism as Grounded in Human Nature' (1893); 'A Philosophical Centenary' (1896); 'Christian Ethics' (1899).

DAVIDSON COLLEGE — DAVIESS

Davidson College, an educational institution at Davidson, N. C.; founded in 1837, under the auspices of the Presbyterian Church. Its professors and instructors are about 20 in number; students, over 200; volumes in the library, 14,000; value of property, \$300,000; income, about \$20,000.

Davie, William Richardson, American soldier: b. England 21 June 1756; d. Camden, S. C., 8 Nov. 1820. He was brought to North Carolina when a child, and was graduated at Princeton, N. J., in 1776. He entered the American army, and obtained a captaincy in Pulaski's Legion. He rose to be colonel and commissary, served throughout the war, and was a favorite officer under Sumter and Greene. He was a member of the convention to form the United States Constitution in 1787, and advocated its acceptance in the convention of North Carolina. Through his influence the University of North Carolina was established. He was elected governor of that State in 1799.

Davies, dā'vêz, Ben, English tenor singer: b. 1858. He studied at the Royal Academy of Music; sang for many years with the Carl Rosa Opera Company; sang in Italian opera, and had the title role in 'Ivanhoe.' He also sings in oratorios and concerts, and has several times visited the United States.

Davies, Charles, American mathematician: b. Washington, Litchfield County, Conn., 22 Jan. 1798; d. Fishkill Landing, N. Y., 18 Sept. 1876. He was educated at the United States Military Academy and was appointed professor of mathematics there in 1828. He held the same post subsequently at Columbia College and in the University of New York. He published: 'Surveying' (1832); an edition of Legendre's 'Geometry'; and other works and text-books on arithmetic, mathematics, etc.

Davies, Emily, English educator: b. Southampton, England, 22 April 1830. She has been identified with the movement for the higher education of women for over 40 years; is life governor of University College, London; honorary secretary of Girton College, Cambridge; and governor of the grammar school, Hitchin. Besides numerous pamphlets, she has published, 'The Higher Education of Women' (1866).

Davies, Henry Eugene, American soldier: b. New York 1836; d. 1894. He was admitted to the bar of New York in 1857, and entering the United States volunteers as captain when the Civil War broke out, he became brigadier-general in 1863. Serving with Sheridan he was made major-general of volunteers 1865. He resigned in 1866, afterward practising law in New York. He published 'General Sheridan' in the 'Great Commanders Series' (1895).

Davies, John, English poet: b. Hereford about 1565; d. London 1618. He was the author of: 'Microcosmos' (1603); 'The Witte's Pilgrimage'; 'The Scourge of Folly'; 'Wit's Bedlam' (1617); etc.

Davies, Sir John, English poet and lawyer: b. Tisbury, Wiltshire, 1569; d. 8 Dec. 1626. He was educated at Westminster and Oxford. Called to the bar in 1595, he became solicitor-general for Ireland in 1603, and attorney-general in 1606, being knighted the next year. He was returned to the English Parliament in 1621, and appointed lord chief justice in 1626.

He wrote: 'Orchestra,' a poem on dancing; 'Hymns to Astraea,' a series of acrostics; 'Nosce Teipsum,' a poem on the immortality of the soul.

Davies, Sir Louis Henry, Canadian jurist: b. Charlottetown, Prince Edward Island, 4 May 1845. He was educated at Prince of Wales College in his native town, and was called to the bar of the Inner Temple, London, in 1866. Beginning practice in Charlottetown he rose rapidly, being solicitor-general 1869 and 1871-2, premier and attorney-general of the island 1876-9, and queen's counsel in 1880. He entered the Dominion House of Commons in 1882, remaining a member till his appointment as a judge of the supreme court of Canada. He was knighted in 1897, and was minister of marine and fisheries 1896-1901. In 1898 he was one of the joint high commission on the part of Great Britain for settlement of all differences with the United States respecting Canada, and was joint delegate to Washington with Sir Wilfrid Laurier on the Bering Sea seal question the year previous.

Davies, Samuel, D.D., American clergyman: b. New Castle County, Del., 3 Nov. 1724; d. Princeton, N. J., 4 Feb. 1761. Ordained in 1747, he was at his request appointed to officiate at different places of worship in Hanover County, Va., where, the Episcopal Church being then the established church of Virginia, dissenters were obnoxious to the civil authorities. His labors were highly successful, and led to a controversy between him and the king's attorney-general as to whether the act of toleration which had been passed in England for the relief of Protestant dissenters extended also to Virginia. The ultimate decision of the question was in the affirmative. The first presbytery in Virginia was established through his exertions in 1755; and in 1758 he was chosen to succeed Jonathan Edwards as president of the College of New Jersey. A collection of his sermons was published after his death, in three volumes, and passed through several editions in Great Britain and America.

Davies, Thomas Alfred, American military officer and writer: b. Black Lake, St. Lawrence County, N. Y., 3 Dec. 1809; d. there 19 Aug. 1899. He was graduated from West Point in 1829, and became a brevet major-general of volunteers in the Civil War. Among his published works are: 'Cosmogony, or Mysteries of Creation' (1858); 'Genesis Disclosed' (1860); 'Answer to Hugh Miller and Theoretical Geologists' (1861); and 'How to Make Money, and How to Keep It' (1866).

Davies, Thomas Frederick, American Protestant Episcopal bishop: b. Fairfield, Conn., 31 Aug. 1831. He was a graduate of Yale in 1853, and subsequently studied at the Berkely Divinity School, where he was for a time professor of Hebrew. He was ordained in 1857, and after being successively rector of St. John's Church, Portsmouth, N. H., and St. Peter's, Philadelphia, was consecrated bishop of Michigan in 1889.

Davieess, dā'vîs, Joseph Hamilton, American lawyer: b. Belford County, Va., 4 March 1774; d. Tippecanoe, Ind., 7 Nov. 1811. He was famed for his eccentricities and was commonly known as 'Jo' Davieess. He was ap-

DÁVILA — DAVIS

pointed United States district attorney in Kentucky and in that capacity prosecuted Aaron Burr for treason. Jo Daviess County in Illinois was named in his honor. He was killed at the battle of Tippecanoe.

Dávila, dá'vê-lă, the name of several persons well known in the history of Spanish-America: 1. GIL GONZALES. (See CENTRAL AMERICA.) 2. JUAN, Spanish soldier: b. Granada, Nicaragua, 1530; served in Peru, and later under Coronado in Costa Rica, and wrote (1566) 'Relación de la Provincia de Costa Rica,' a document of historical value. 3. COELLO Y PACHECO, governor and captain-general of Chile, 1667-70.

Davila, Alonzo, Spanish soldier: b. city of Mexico; d. there 1566. He was supposed to be implicated in a plot to make Martin Cortes ruler of New Spain, and was executed on this account.

Davila, Enrico Caterino, ên-rê'ko kă-têr-ê'nô, Italian statesman and historian: b. near Padua, Italy, 30 Oct. 1576; d. near Verona 8 Aug. 1631. His father, a Cypriote, who fled to Venice after the conquest of Cyprus by the Turks in 1561, introduced him to the French court, where he was made page; after this he entered the French service, in which he highly distinguished himself. He subsequently entered the Venetian service, gradually rose to the post of governor of Dalmatia, Friuli, and the island of Candia, and was esteemed at Venice the first man in the republic after the doge. He is principally celebrated for his 'History of the Civil Wars of France, from 1559 to 1598' (Storia della Guerre Civili di Francia, Venice, 1630). This has been translated into several languages, and deserves a place near the works of Guicciardini and Machiavelli.

Dávila, Pedrarias, Spanish governor of the Darien colony, Castilla del Oro, and Nicaragua: b. about 1440; d. Leon, Nicaragua, July 1530. His name was originally Pedro Arias, but the form given above is better known in history. He was the brother of the Conde de Puñonrostro, and married the daughter of the Condesa de Moya, the friend of Isabel the Catholic; won distinction in the wars of Granada, and enjoyed the protection of Fonseca, bishop of Burgos, master of the affairs of the Spanish-American colonies during the reigns of Ferdinand and Isabel and Charles I. Fonseca made Dávila governor of Darien in 1514, and the governor promptly employed the adventurers who accompanied him in a number of expeditions, including that of Hernan Ponce and Bartolomé Hurtado (1516) to the coasts of the present republics of Nicaragua and Costa Rica. He established himself at Panama, and had at his command the famous soldiers Balboa, Hernandez de Córdoba, De Soto, Ojeda, Olid, Ponce, and Francisco Pizarro. In 1526-7 he asserted that, as governor of Castilla del Oro, he ought to administer Nicaragua and Honduras as well. His claim to the former was recognized. Balboa suffered death in consequence of incurring his enmity. Pedrarias is cited most frequently as the type of the vigorous, but wholly unscrupulous official of the first period of Spanish colonization on the American mainland.

Dávila y Padilla, ê pā thêl yā, **Augustín**, Mexican historian: b. Mexico 1562; d. Santo

Domingo 1604. He entered the order of Dominicans in 1578, taught philosophy and theology at the College of La Puebla and Mexico, becoming prior of his convent La Puebla, and procurer of his order at the courts of Madrid and Rome 1596. He became preacher for Philippe II. 1598, and was consecrated as archbishop of Santo Domingo 1601. He burned several hundred copies of the Bible translated into Spanish and annotated by Protestants. He wrote 'Historia de la provincia de Santiago de Mejico' (1596-1634); and 'Ancient History of the Mexicans.'

Da Vinci, Leonardo. See VINCI, LEONARDO DA.

Davis, Andrew Jackson, American spiritualist and author: b. Orange County, N. Y., 11 Aug. 1826. He is a resident of Boston, Mass., and the author of more than 30 volumes, chief among which are: 'The Great Harmonia'; 'Harmonial Man'; 'Philosophy of Spiritual Discourse'; 'The Penetralia.'

Davis, Charles Belmont, American author: b. Philadelphia, Pa., 24 Jan. 1866. He is a son of Rebecca Harding Davis (q.v.), was educated at Lehigh University, and was United States consul at Florence, Italy, for some time. He has written 'The Borderland of Society.'

Davis, Charles Henry, American mathematician: b. Boston 16 Jan. 1807; d. Washington, D. C., 18 Feb. 1877. He entered the United States navy in 1823, served in the Civil War, and became rear admiral in 1863. He made several coast surveys, and wrote: 'Mémorial upon the Geological Action of the Tidal and Other Currents of the Ocean'; and 'The Law of Deposit of the Flood Tide.' He was one of the founders of the 'American Nautical Almanac.'

Davis, Charles Henry Stanley, American physician and Egyptologist: b. Goshen, Conn., 2 March 1840. He studied medicine in New York and in European hospitals and subsequently settled in Meriden, Conn., of which he was mayor 1887-8, and city treasurer 1897-9. He has published 'History of Wallingford and Meriden'; 'The Voice as a Musical Instrument'; 'Classification, Education and Training of Feeble Minded, Imbecile and Idiotic Children'; 'The Egyptian Book of the Dead' (edited); 'History of Egypt in the Light of Modern Discoveries'; 'Grammar of the Old Persian Language.' He has been editor of 'Biblia,' a journal of Oriental archaeology, for 14 years and is a member of many learned societies.

Davis, Cushman Kellogg, American legislator: b. Henderson, N. Y., 16 June 1838; d. St. Paul, Minn., 27 Nov. 1900. He was graduated at the University of Michigan in 1857; was admitted to the bar, but enlisted in the Union army in 1861. He began the practice of law in St. Paul in 1865; was chosen to the Minnesota legislature in 1867; became United States district attorney in 1868; governor in 1874; and United States senator in 1887, 1893 and 1899. He was a Republican, and a member of the peace commission which negotiated the treaty between Spain and the United States in 1898. He was for several years chairman of the Senate Committee on Foreign Relations, and reported the resolution which practically declared war against Spain.

DAVIS

Davis, David, American jurist: b. Cecil County, Md., 9 March 1815; d. Bloomington, Ill., 26 June 1886. He was graduated at Kenyon College in 1832, and settled in Illinois as a lawyer in 1835. He was elected to the legislature in 1844 and served as a State circuit judge from 1848 to 1862. In the latter year he was appointed an associate justice of the Supreme Court of the United States. He voted in favor of the Legal Tender Act. He resigned in 1877 to enter the United States Senate, of which he became president pro tem. in 1881, and retired in 1883.

Davis, Edwin Hamilton, American archaeologist: b. Ross County, Ohio, 22 Jan. 1811; d. New York 15 May 1888. He was the author of 'Ancient Monuments of the Mississippi Valley' (1848), which was described by A. Morlot, the distinguished Swiss archaeologist, as being "as glorious a monument of American science as Bunker Hill is of American bravery."

Davis, George Royal, American financier: b. Palmer, Mass., 3 June 1840; d. Chicago 25 Nov. 1899. He enlisted for the Civil War, rising to the rank of colonel, and resigning from the army in 1871. From 1879 to 1885 he was a Republican member of Congress, and served for years on the Republican National Committee. He was director-general of the World's Columbian Exposition, Chicago, in 1893.

Davis, Henry Gassaway, American capitalist and legislator: b. Baltimore, Md., 16 Nov. 1823. He became superintendent of the plantation of ex-Gov. George Howard of Maryland, near Woodstock, Md., and subsequently was brakeman and conductor on the Baltimore & Ohio railway, and agent at Piedmont, W. Va. Then he was active as a merchant and collier at Piedmont, and later carried to success the West Virginia Central & Pittsburg Railway, by means of which he gave access to timber and coal lands of great value. The president of this road, he also became president of the Piedmont & Cumberland line. He was elected as a Democrat to the West Virginia House of Delegates in 1865, was State senator in 1867-9, and having served two terms (1871-83) as United States senator, declined re-election. In July 1904 he was nominated by the Democratic party for the vice-presidency of the United States. He was a delegate to the Pan-American congress, and became also a member of the Intercontinental Railway Commission.

Davis, Henry Winter, American statesman and orator: b. Annapolis, Md., 16 Aug. 1817; d. Baltimore, Md., 30 Dec. 1865. He was a member of Congress for three terms (1856-65), and took a leading part in advocating emancipation and loyalty to the Union. His published works are: 'The War of Ormuzd and Ahriman in the 19th century' (1853); 'Speeches and Addresses in Congress' (1867).

Davis, Jefferson, American statesman: b. Abbeville, Christian County, Ky., 3 June 1808; d. New Orleans, La., 6 Dec. 1889. When he was three years old, his father removed with his family to Wilkinson County, Miss. He received an academical education and entered Transylvania University, Lexington, Ky., in 1822, which he left in 1824 to enter the United States Military Academy, from which he was graduated in 1828. He was appointed a second

lieutenant of infantry, and served on the north-western frontier during the Black Hawk war of 1831-2. In 1831 he was promoted to first lieutenant of dragoons for gallantry in action, and was employed in operations against the Pawnees, Comanches, and other Indian tribes. In June 1835, he resigned his commission, and retired to a cotton plantation in Mississippi. He continued in retirement until 1843, when he began to take an interest in politics upon the Democratic side; and in 1844 was chosen a presidential elector. In 1845 he was elected a representative to Congress; but resigned in 1846, having been elected colonel of the First Mississippi Volunteer Regiment of rifles, and served in the Mexican war, greatly distinguishing himself at Monterey and Buena Vista, and being severely wounded in the latter battle. He was appointed a brigadier-general of volunteers by President Polk in 1847, but declined the commission on the grounds that, by the Constitution, the militia appointments were reserved to the States, and that such appointments by the President were in violation of State rights.

The same year he was chosen to fill a vacancy in the United States Senate, and was re-elected by acclamation in 1850 for a full term. In 1853 he was appointed secretary of war by President Pierce, and in 1857, was again elected to the United States Senate, when he took a prominent place among the Southern leaders, and was among the most determined of them all in his assertions of the rights of the States under the Constitution, and also of the right of secession. On 21 Jan. 1861, he took his leave of the Senate in a speech in which he gave his opinion that, by the secession of his State, his connection with that body was terminated, and reaffirmed the doctrine of the right of secession. The Confederate Congress, at Montgomery, Ala., chose him President, under the Provisional Constitution, on 9 Feb. 1861, and he accepted the office on the 16th in a brief address, in which he expressed his desire for the maintenance of peaceful relations with the States which remained in the Union. He asserted that all that the seceding States desired was to be "let alone," but announced that, if war should be forced upon them, they would make the enemies of the South "smell southern powder and feel southern steel."

When Fort Sumter was reduced by the Confederates, and war declared, he found it necessary to put all his previous experience into the immense task of organizing the military resources of the seceding States. He may be said to have created the army, the navy, the arsenals, and all the organization necessary to carry on a war which lasted four years. He bore himself through the varying struggle with untiring energy, and when, in 1865, a feeling of despair spread over the Southern States, he was the last to admit that they had been defeated.

On 17 April, two days after the first proclamation of President Lincoln, he responded by a proclamation authorizing privateering; and on 14 August issued a second one, warning all persons of 14 years and upward, owing allegiance to the United States, to leave the Confederacy within 40 days, or be treated as alien enemies. On 6 November he was chosen permanent President, and was inaugurated 22 Feb. 1862. On 21 May he approved an act in answer to one enacted by the United States

JEFFERSON DAVIS.

DAVIS

government, providing that all persons owing debts to parties in the North should pay the same into the Confederate treasury. Mr. Davis continued to be President of the southern Confederacy until his capture at Irwinsville, Ga., 10 May 1865, having left Richmond a few hours before Gen. Lee withdrew his troops, and after Gen. Lee's surrender, when he was endeavoring to reach the army of the West. He was conveyed to Fort Monroe, and indicted by the grand jury of the District of Columbia for treason. He was never brought to trial; never asked pardon, and only asked a trial; but, after two years' imprisonment, was released, at the instance of the government, on bail, Horace Greeley becoming one of his sureties. He was included in the General Amnesty Act of Congress, 25 Dec. 1868. In 1871 he had a public reception at Atlanta, Ga., and made a speech in which he reaffirmed his adhesion to the doctrine of State sovereignty. For several years after the war he was president of a southern insurance company and resided in Memphis, Tenn. The last years of his life were spent at Beauvoir, Miss., on an estate that he bought of Mrs. Dorsey before her death. In 1893 amid imposing ceremonies his remains were removed to Richmond, Va., and re-interred in Hollywood cemetery. A number of works have been published on the official life of Mr. Davis, and he himself gives a narrative of the stirring events of 1861-5 in 'The Rise and Fall of the Confederate Government' (1881). A more personal view of the Confederate leader is depicted in 'Jefferson Davis, a Memoir by His Wife' (1890). MRS. JEFFERSON DAVIS.

Davis, Jefferson Columbus, American military officer: b. Clark County, Ind., 2 March 1828; d. Chicago, 30 Nov. 1879. He left school for the Mexican war, in which he received a commission for gallantry. He was with the garrison at Fort Sumter, S. C., as first lieutenant when its bombardment began the Civil War. He received the brevet of major-general of volunteers, and the full rank of colonel in the regular army for distinguished service on the Union side during the war. For some years after the war he was stationed on the Pacific coast, and was the first United States army officer to hold command in Alaska, where a new post, Port Davis, was named after him in 1900.

Davis, Jessie Bartlett, American contralto singer: b. Morris, near Chicago, 1860. She began her musical career as a church-choir singer; became noted as "Little Buttercup" in 'Pinafore,' presented by the Chicago Church Choir Opera Company 1879, and in 1882 filled the role of Siebel to Adelina Patti's "Margarite," in 'Faust.' She was a pupil of Albiles and later studied a year in Paris with Madame La Grange. She was married to W. J. Davis in 1880, and in 1886 joined the American Opera Company as leading contralto, her husband managing the company. For many years she took leading contralto parts with 'The Bostonians,' achieving great success in "Alan-a-Dale" in 'Robin Hood.'

Davis, John, English navigator: b. Sandridge, near Dartmouth, Devonshire, about 1550; d. 30 Dec. 1605. In 1585 he was sent out with two vessels to find a northwest passage, when

he discovered the strait which still bears his name. He afterward explored the coasts of Greenland and Iceland, proceeding as far as lat. 73° N. He made five voyages to the East Indies, on the last of which he was killed in an engagement with some Japanese pirates off the coast of Malacca. He wrote an account of his voyages, and invented a quadrant.

Davis, John Chandler Bancroft, American lawyer and diplomatist: b. Worcester, Mass., 29 Dec. 1822. In 1849 he went to London as secretary of the United States legation; in 1854 became American correspondent of the London *Times*, and in 1869, 1871, and 1873-4 was assistant secretary of state. He represented the United States in the "Alabama" contest, zealously pushing the "indirect" claims; was minister to Germany in 1874-7; and judge of the United States court of claims in 1878-82; and became reporter of the United States Supreme Court in 1883. He is the author of: 'The Massachusetts Justice' (1847); 'Mr. Sumner, the Alabama Claims, and their Settlement' (1878); a work published in French entitled 'Process Tribunals of the United States' (1878); and many volumes of United States Supreme Court reports.

Davis, Mary Evelyn Moore, American novelist: b. Talladega, Ala., 1852; married Thomas E. Davis in 1874. She has published: 'Minding the Gap and Other Poems'; 'In War Times at La Rose Blanche'; 'Under the Man-Fig' (1895); 'An Elephant's Track and Other Stories'; 'Under Six Flags'; 'The Wire Cutters' (1899); 'The Queen's Garden' (1900); 'Jaconetta.'

Davis, Matthew L., American writer: b. 1766; d. Manhattanville, N. Y., 21 June 1850. He was originally a printer by trade, and acquired in the course of that business a desultory education and considerable skill as a writer. He early attached himself in politics to the fortunes of Aaron Burr, and was an advocate of his elevation to the presidency. For many years he was the correspondent at Washington of the New York *Courier and Enquirer*, under the signature of "The Spy in Washington." For the London *Times* also he wrote under the name of the "Genevieve Traveller." During many years before the death of Aaron Burr Mr. Davis was apparently his only attached friend, and the most important of his writings is his 'Memoirs of the Life of Aaron Burr.' Burr's diary was also edited by him.

Davis, Minnie S., American author and lecturer: b. Baltimore, Md., 1835. She was educated at the Green Mountain Liberal Institute, Vermont. After being an invalid for 25 years with spinal disease, she was healed in 1885 by "Mental Science," as she believes, and has since written and lectured upon that topic. Her published books are: 'Marion Lester' (1850); 'Clinton Forest' (1858).

Davis, Nathan Smith, American physician: b. Greene, N. Y., 9 Jan. 1817; d. Chicago, Ill., 16 June 1904. He studied medicine and since 1849 has practised his profession in Chicago. He was one of the founders of the Chicago Medical College, now a department of Northwestern University and was a professor there for 30 years, resigning in 1898. He has edited several medical journals and pub-

DAVIS — DAVIS STRAIT

lished: 'Principles and Practice of Medicine'; 'Medical Education and Reform'; 'Verdict of Science Concerning the Effects of Alcohol on Man.'

Davis, Noah, American lawyer: b. Haverhill, N. H., 10 Sept. 1818. He was admitted to the New York State bar in 1841 and practised for some time in Buffalo. He was justice of the New York supreme court 1857-68, and again 1872-87. The noted cases of Edward Stokes for the murder of James Fisk, Jr., and of William M. Tweed for malfeasance, were tried before him.

Davis, Noah Knowles, American philosophical writer: b. Philadelphia, Pa., 15 May 1830. He was educated at Mercer University, Ga., and after holding various educational positions, has been professor of philosophy at the University of Virginia from 1873. He has published: 'The Theory of Thought' (1880); 'Elements of Deductive Logic' (1890); 'Elements of Psychology' (1892); 'Judah's Jewels: a study in the Hebrew Lyrics' (1895); 'Elements of Ethics' (1900); 'Synopsis of Events in Life of Jesus of Nazareth' (1900); 'The Nazarene' (1901).

Davis, Oscar King, American journalist: b. Baldwinsville, N. Y., 13 Jan. 1866. He was graduated from Colgate University in 1888 and was a special correspondent for the New York *Sun* and 'Harper's Weekly' at Manila 1898-9, and in China in 1900. He has published: 'Our Conquests in the Pacific.'

Davis, Rebecca Blaine Harding, American novelist: b. Washington, Pa., 24 June 1831. She was married to L. C. Davis in 1863. She contributed many short stories and sketches to periodicals, and has written several novels, including: 'Life in the Iron Mills' (1861); 'A Story of To-day' (1861), published later under the title 'Margaret Howth'; and 'A Law Unto Herself' (1878). She was the first writer in this country to introduce the labor question into fiction. Her later works include: 'Waiting for the Verdict'; 'Dallas Galbraith'; 'Natasqua'; 'Frances Waldeaux'; 'Doctor Warrick's Daughters'; 'Silhouettes of American Life.'

Davis, Richard Harding, American novelist and litterateur: b. Philadelphia 18 April 1864. He is a son of Rebecca Harding Davis (q.v.). He was graduated at Lehigh University, and entered journalism in Philadelphia. His first purely literary success was the story of 'Gallegher,' based upon his newspaper experiences, and published with other stories in a volume (1891). He has since been constantly engaged in story-writing, and descriptive narration of events, places, and people. Among his works are 'Stories for Boys' (1891); 'The West from a Car Window' (1892); 'Van Bibber and Others' (1892); 'Our English Cousins' (1894); 'The Rulers of the Mediterranean' (1894); 'The Princess Aline' (1895); 'About Paris' (1895); 'Three Gringos in Venezuela and Central America' (1896); 'Soldiers of Fortune' (1897) 'Cuba in War Time' (1898); 'A Year From a Reporter's Note Book' (1898); 'Cinderella, and Other Stories'; 'Exiles'; 'The Lion and the Unicorn' (1899); 'Episodes from a Car Window' (1899) 'With Both Armies in South Africa' (1900). In 1898 he was a war correspondent in Cuba and in 1900 he acted in the same capacity in South Africa.

Davis, Thomas Osborne, Irish poet: b. Mallow, County Cork, 14 Oct. 1814; d. Dublin, 16 Sept. 1845. His verse was mainly on patriotic themes, and appears, collected, in Duffy's 'Library of Ireland.'

Davis, Val, English artist: b. Liverpool, England, 1854. He studied art under his father, William Davis, a painter of some note, and under Ford Madox Brown, and has exhibited at the Royal Academy almost continuously from 1875.

Davis, Varina Anne Jefferson, American novelist: b. Richmond, Va., 27 June 1804; d. Narragansett Pier, R. I., 18 Sept. 1898. She was called "the Daughter of the Confederacy," her father being Jefferson Davis, the President of the Confederate States. Her education was obtained partly in the United States and partly in Germany and France, and she wrote 'The Veiled Doctor,' a novel, and 'A Romance of Summer Seas.'

Davis, Varina Howell Jefferson, American writer: b. Vicksburg, Miss., 7 May 1826. She was the second wife of Jefferson Davis (q.v.), to whom she was married in Natchez, 26 Feb. 1845. She was her husband's amanuensis when he wrote his 'Decline and Fall of the Confederate Government' and is the author of 'Jefferson Davis: a Memoir, by His Wife' (1890).

Davis, William Morris, American geologist and meteorologist: b. Philadelphia, Pa., 12 Feb. 1850. He has been professor of geology at Harvard University from 1890 and has published 'Elementary Meteorology'; 'Physical Geography'; 'Whirlwinds, Cyclones and Tornadoes' (1884), and many professional papers.

Davis, William Thomas, American lawyer and author: b. Plymouth, Mass., 3 March 1822. He was educated at Harvard and was admitted to the bar in 1849. He was at the head of the government of his native town for many years, and has published 'History of Plymouth'; 'Ancient Landmarks of Plymouth'; 'History of the Bench and Bar of Massachusetts'; etc.

Davis, William Watts Hart, American writer: b. Southampton, Bucks County, Pa., 27 July 1820. He was graduated at Norwich University in 1842; was instructor in the military academy at Portsmouth, Va., in 1842, and was admitted to the bar in 1845. He served in the Mexican war and was mustered out as captain in 1848. Removing to New Mexico he was United States district attorney, attorney-general, secretary of the treasury, acting governor, superintendent of Indian affairs and superintendent of public buildings, beside publishing the *Santa Fe Gazette* for two or three years. He attained the rank of brevet brigadier-general in the civil war between the States, was twice defeated as Democratic nominee for Congress, and was United States commissioner to the Paris Exposition in 1878. He has published 'El Gringo: or New Mexico and Her People'; 'Spanish Conquest of New Mexico'; 'History of Bucks County'; etc.

Davis Strait, a strait on the west coast of Greenland, which connects Baffin Bay with the Atlantic Ocean. At its narrowest point, immediately north of the Arctic circle, it measures about 200 miles across. In 1888 the identity between Ginnunga Gap, referred to in the Sagas, and the present Davis Strait, was demonstrated. See DAVIS, JOHN.

DAVIT — DAVY LAMP

Davit. (1) A beam projecting from a ship's bow, for the attachment of the tackle whereby the anchor-fluke is lifted without dragging against the side of the vessel. The operation is nautically called "fishing the anchor." (2) One of a pair of cranes on the gunwale of a ship, from which are suspended the quarter or other boats. The boat-tackles are attached to rings in the bow and stern of the boat respectively, and the fall is belayed on deck. When the boat is lowered the hooks of the fall-blocks are cast off simultaneously, or great danger results when the ship is under way.

Davitt, Michael, Irish political leader: b. near Straid, County Mayo, 25 March 1846. Evicted from their small holding, the family emigrated to Haslingden in Lancashire (1851). In 1866 he joined the Fenian movement, the result being that he was sentenced in 1870 to 15 years' penal servitude. He was released in 1877; and, supplied with funds from the United States, began some two years later an anti-landlord crusade in Ireland, which culminated in the foundation of the Irish Land League (21 Oct. 1879). Davitt was thenceforward in frequent collision with the government, and from February 1881, to May, 1882, was imprisoned in Portland for breaking his ticket-of-leave. His 'Leaves from a Prison Diary' were published in 1885. Other works by him are: 'Defence of the Land League' (1891); 'Life and Progress in Australia' (1898); 'The Boer Fight for Freedom' (1902). The views of the "Father of the Land League" on the subject of land therein take a Socialistic form, and accordingly, though a strong Home Ruler, on the question of land nationalization he found himself in opposition to the Parnellites. After the split in the party, he opposed the continued leadership of Mr. Parnell, and was returned to Parliament in 1892 as an anti-Parnellite, but unseated on petition, on the ground of clerical and other intimidation. He was returned unopposed for South Mayo in 1895, resigning in 1899.

Da'vium. See DAVYUM.

Davos, dā'vōs, a valley and district of Switzerland in the canton of Grisons, lying at a considerable elevation among the Alps, and now a favorite place of residence both in summer and winter for people troubled with tuberculosis. The valley is about 10 miles long, shut in by mountains from 6,000 to 10,000 feet high, and exhibiting many picturesque features. The chief centre of population is Davos-Platz, a place of 5,000 inhabitants, containing numerous hotels, boarding-houses, and other establishments for visitors, and having a handsome town-house, and an English church. It is well sheltered on the north and east, and the air is remarkably pure and dry.

Davout, Louis Nicolas, loo-ē nīk-ō-lā dā-voo, marshal of France: b. Annoux 10 May 1770; d. Paris, 1 June 1823. He entered the army in 1785, took sides with the revolutionists, fought several battles under Dumouriez, and was made a brigadier-general in 1793. He accompanied Napoleon in his Italian campaigns and in his expedition to Egypt. In 1804 he was made a marshal of the empire. The victories of Ulm and Austerlitz were mainly due to him, as also those of Eckmühl and Wagram. For these meritorious services he was created Duke of Auerstadt and Prince of Eckmühl. After the retreat from

Moscow he defended Hamburg against all the forces of the allies, and surrendered only after the peace of 1814. When Napoleon returned from Elba, Davout was appointed his minister of war. After the battle of Waterloo he lived in retirement till 1819, when he took his seat in the Chamber of Peers.

Davy, Sir Humphry, English chemist: b. Penzance, Cornwall, 17 Dec. 1778; d. Geneva, Switzerland, 29 May 1829. A taste for chemistry, which he displayed in some experiments on the air contained in sea-weed, attracted the attention of Mr. Gilbert, president of the Royal Society, and Dr. Beddoes, and the latter offered him the place of assistant in his laboratory. Here Davy discovered the respirability and exhilarating effect of the nitrous oxide. He published the results of his experiments, under the title of 'Chemical and Philosophical Researches' (1800). This work immediately obtained him the place of professor of chemistry in the Royal Institution, at the age of 22. In 1803 he was chosen a member of the Royal Society. His lectures at the Royal Institution were attended by crowded and brilliant audiences, attracted by the novelty and variety of his experiments, the eloquence of his discourses, and the clearness of his exposition. His discoveries with the galvanic battery, his decomposition of the earths and alkalies and ascertaining their metallic bases, his demonstration of the true nature of oxymuriatic acid, his discovery of chlorine as an element, etc., obtained him a European reputation; and in 1808 he received the Napoleon prize of the French Institute. In 1812 he was knighted. In 1813 appeared his valuable 'Elements of Agricultural Chemistry.' The numerous accidents arising from fire-damp in mines led him to enter upon a series of experiments on the nature of this explosive gas, the result of which was the invention of his safety-lamp (1815). In 1818 he received a baronetcy. In 1820 he succeeded Sir J. Banks as president of the Royal Society. Near the close of his life he wrote his 'Salmonia, or Days of Fly-fishing'; and his 'Consolations in Travel, or the Last Days of a Philosopher.' Besides the works already mentioned, he also wrote: 'Elements of Chemical Philosophy' (1802); 'Bakerian Lectures' (1807-11); 'On the Safety-lamp' (1818); etc. A statue was erected to him at Penzance in 1872.

Davy, John, English composer: b. Upton-Helion, Exeter, 1765; d. London 22 Feb. 1824. He was a teacher of music in London and wrote music for popular songs. His air, 'The Bay of Biscay, Oh!' is famous.

Davy Jones, a sailor's familiar name for a malignant sea-spirit or the devil generally. The common phrase "Davy Jones' locker" is applied to the ocean as the grave of men drowned at sea. A very dubious explanation of the name makes it compounded from Duffy, a West Indian negro spirit name, and the scriptural prophet Jonah, in jocular allusion to his somewhat unusual adventure.

Davy Lamp, the safety-lamp of Sir Humphry Davy, in which a wire-gauze envelope covers the flame-chamber and prevents the passage of flame outward to the explosive atmosphere of the mine, while it allows circulation of air.

DAVYUM — DAWSON

Davyum, or **Davium** (named in honor of Sir Humphry Davy), a substance observed by Kern, in June 1877, in certain Russian ores of platinum, and believed by him to be a metallic element. It is hard, infusible, malleable at a red heat, silvery in lustre, and soluble readily in aqua regia and feebly in boiling sulphuric acid. Mallet (Am. Chem. Jour., Vol. XX., p. 776) has shown that davium is not an element, but that it consists of a mixture of zircon, osmium, iridium, and finely divided quartz.

Daw. See JACKDAW.

Dawalla (*Hypophthalmus dawalla*), a fish of the family *Siluridae*, found in the rivers of Guiana, and highly esteemed for the delicacy of its flesh. It is sometimes two and a half feet long, and is brightly colored. The eye is situated below the angle of the mouth.

Dawant, Albert Pierre, äl-bär pē-är dā-vän, French historical painter: b. Paris 21 Sept. 1852. He was a pupil of J. P. Laurens. He took a medal of the third class 1880, and second class 1885. Among his works are: 'St. Thomas à Becket' (1879); 'Henry IV. of Germany Before Pope Gregory VII.' (1880); 'Last Moments of Charles II. of Spain' (1881); 'Burial of an Invalid' (1882); 'Salute to the Invalides' (1884); 'St. John the Hospitaller' (1885); 'Embarking of Emigrants'; and 'The Rescue' (1889); 'In Alsace' (1892); 'Teaching the Children' (1888), in the Luxembourg Museum; 'End of the Mass' (1890); 'A Rehearsal' (1894); 'Marshall Lannes at Convent of St. Pollen' (1895); 'The Captive' (1896).

Dawe, Carlton, English novelist. He has written: 'Mount Desolation'; 'The Emu's Head'; 'Yellow and White'; 'Kakemonos'; 'Captain Castle'; 'The Voyage of the Pulo Way'; 'A Bride of Japan'; 'The Mandarin'; 'Rose and Chrysanthemum'; 'The Yellow Man'; 'Claudia Pole'; 'Straws in the Wind'; 'The Demagogue.'

Dawes, Anne Laurens, American writer: b. North Adams, Mass., 14 May 1851. She is the daughter of H. L. Dawes (q.v.) and has been Washington correspondent of several New England papers, besides being prominent in various philanthropic and other organizations. She is the author of 'How We are Governed' (1885); 'The Modern Jew: His Present and Future' (1886); 'Explanation of the Constitution and Government of the United States' (1895); 'Charles Sumner' (1892).

Dawes, Charles Gates, American financier: b. Marietta, Ohio, 27 Aug. 1865. He was educated at Marietta College and the Cincinnati Law School, was for some time engaged in civil engineering, and practised law in Lincoln, Neb., 1887-94. He was active in Republican politics, and in 1897 became comptroller of the treasury. He is the author of 'The Banking Systems of the United States.'

Dawes, Henry Laurens, American legislator: b. Cummington, Mass., 30 Oct. 1816; d. Pittsfield, Mass., 5 Feb. 1903. He was graduated at Yale in 1839. Becoming a lawyer, he entered the State Senate as a Republican and in 1857 was elected to Congress, serving in the House until 1873. He was elected to the United States Senate in 1875, and was re-elected in 1881 and 1887. The condition of the Indian tribes especially claimed his attention, and after

his retirement from Congress he was at the head of the Commission to the Five Civilized Tribes.

Dawes, Rufus, American poet: b. Boston 26 Jan. 1803; d. Washington, D. C., 30 Nov. 1859. He wrote 'The Valley of the Nashaway, and Other Poems' (1830); 'Geraldine' (1839), resembling 'Don Juan' in form and treatment; the successful romance 'Nix's Mate' (1840). His verses were sung at the laying of the corner-stone of Bunker Hill monument.

Dawes, William Rutter, English astronomer: b. London 19 March 1799; d. Haddenham, Buckinghamshire 15 Feb. 1868. He is principally celebrated for his accurate measurements of double stars and for his investigation into the minute details of the solar surface.

Dawes' Holes, minute circular spots on the nucleus of a sun-spot, darker than the rest of the nucleus, and supposed to be the mouths of tubular orifices penetrating to unknown depths. They were first observed by the astronomer whose name they bear.

Dawk, or **Dak**, a term in India for postal traveling arrangements, as by palanquins or other carriages.

Dawkins, John. See ARTFUL DODGER, THE.

Dawkins, William Boyd, English geologist: b. Buttington, near Welshpool, Montgomeryshire, 26 Dec. 1838. In 1862 he joined the Geological Survey, became curator of Manchester Museum in 1869, and professor of geology in Owens College there in 1874. In 1882 he presided over the anthropological section at the Southampton meeting of the British Association. The Channel Tunnel Committee employed him in 1882 to make a special survey of both coasts, and next year he laid down the line for a tunnel under the Humber. He is a Fellow of the Royal and other learned societies, and has contributed numerous papers to their issues relating especially to fossil mammalia. His chief works are: 'Cave-hunting: Researches on the Evidences of Caves Respecting the Early Inhabitants of Europe' (1874); 'Early Man in Britain, and His Place in the Tertiary Period' (1880); the latter a work of great interest; 'British Pleistocene Mammalia' (1866-87).

Dawlish, dā'lish, popular watering place in Devonshire, England, situated at the entrance of a valley which extends inland from the English Channel, between the mouths of the Teign and Exe. Its genial climate, its bathing facilities, and other attractions render it a place of great resort. Pop. (1901) 4,003.

Dawson, Alec John, English novelist and traveler: b. Wandsworth, England, 1871. He has traveled extensively in the South Seas, Africa, South America, etc., and is the author of 'Middle Greyness'; 'Mere Sentiment'; 'Lee-way'; 'God's Foundling'; 'The African Nights' Entertainments'; 'Bismillah'; 'In the Bight of Benin'; 'Daniel Whyte'; 'The Story of Ronald Kestrel'; 'Joseph Klassin: Half Caste.'

Dawson, George Mercer, Canadian geologist: b. Pictou, Nova Scotia, 1 Aug. 1849; d. 1901. He was a son of Sir J. W. Dawson (q.v.) and was educated at McGill University and at the Royal School of Mines in London. In 1874 he was made assistant director

DAWSON—DAY

and in 1895 director of the Geological Survey of Canada. He was the author of 'Geology and Resources of the Forty-ninth Parallel,' and similar works.

Dawson, Henry, English landscape painter: b. Hull 3 April 1811; d. Chiswick 13 Dec. 1878. In early life he was a worker in a Nottingham lace-factory, but this occupation he gave up for art in 1835. After struggling some time at Nottingham he removed to Liverpool in 1844, and thence to Croydon in 1850, and subsequently he resided at Chiswick. It was long before his abilities were fully recognized, and his pictures began to bring high prices only a little before his death. Among the best of them are 'Wooden Walls of Old England'; 'London from Greenwich Hill'; 'Houses of Parliament'; 'The Rainbow'; 'Rainbow at Sea'; 'The Pool Below London Bridge.'

Dawson, Sir John William, Canadian geologist: b. Pictou, Nova Scotia, 13 Oct. 1820; d. Montreal 19 Nov. 1899. He was educated at Edinburgh University, and early turned his attention to geology. He accompanied Sir Charles Lyell when examining the geology of Nova Scotia in 1842. In 1850 he became superintendent of education for Nova Scotia, and in 1855 principal and professor of natural history in McGill College, Montreal, in which position, as well as in that of vice-chancellor, and latterly principal of the university (1855-93), his services in the cause of education were of very great importance. He became a member of the Royal Society (London) in 1862, was knighted in 1885, and was president of the British Association in 1886 during its meeting at Birmingham. His published works include: 'Acadian Geology' (1855); 'Archæia, or Studies of the Narrative of Creation in Genesis' (1857); 'Agriculture for Schools' (1864); 'Handbook of Canadian Zoology' (1871); 'The Story of Earth and Man' (1872); 'The Origin of the World' (1878); 'The Chain of Life in Geological Time' (1881); 'The Geological History of Plants' (1888); 'Modern Science in Bible Lands' (1888); 'Handbook of Canadian Geology' (1889); 'Modern Ideas of Evolution' (1890); 'The Ice Age in Canada' (1894).

Dawson, Miles Menander, American actuary and author: b. Viroqua, Wis., 13 May 1863. He has published: 'Elements of Life Insurance' (1892); 'American Life Insurance Methods' (1893); 'Assessment Life Insurance' (1895); 'Lessons in Actuarial Science' (1897); 'American Experience' (1900); 'Things Agents Should Know' (1900); etc.

Dawson, William James, English poet, novelist, and clergyman: b. Towcester, Northamptonshire, 21 Nov. 1854. He entered the Wesleyan ministry in 1875 and held various Wesleyan pastorates until 1892, when he became pastor of the Highbury Quadrant Congregational Church, London. His works include: 'Arvalon: a First Poem' (1878); 'A Vision of Souls' (1884); 'Quest and Visions: Essays on Life and Liberation' (1886); 'The Threshold of Manhood' (1889); 'The Makers of Modern Poetry' (1890); 'The Redemption of Edward Strahan: a Social Story' (1891); 'Poems and Lyrics' (1893); 'London Idylls' (1895); 'The Comrade-Christ: Sermons' (1894); 'The Story of Hannah' (1896); 'The House of Dreams' (1897); 'Through Lattice Windows' (1897);

'Table Talk With Young Men' (1898); 'Judith Boldero, a Tragic Romance' (1898); 'Makers of Modern Prose' (1899); 'Savonarola: a Drama' (1900); 'The Man Christ Jesus' (1901).

Dawson, Canada, a mining city and the capital of the Yukon District, Northwest Territories. It is situated at the junction of the Klondike and Yukon rivers, about 50 miles from the Alaskan boundary; in lat. about 64° N. and lon. 139° W. The houses are, many of them, rude structures, but some well-built residences have been erected. The city has churches, schools, banks, hotels, newspapers, theatres, stores, and an electric light plant. Forty below zero is the average temperature for days at a time, but blizzards are not common. Thawing the ground by steam, the use of automatic lifts and buckets, and many other improvements have made mining less laborious and more profitable than when Dawson was first settled, 16 Aug. 1896. Coal deposits have been found nearby, and many of the streams have been bridged by the Canadian government, so that all creeks and other waterways for 40 miles around are connected with Dawson. Pop. 10,000.

Dax, daks, a town of France, department of Landes, on the left bank of the Adour. It consists of the town proper, surrounded by old ramparts partly Roman, and of a suburb called Sablar, on the opposite side of the river and communicating with it by a bridge. The principal edifices are the high church, once a cathedral, the bishop's palace, now occupied as public offices, the communal college, normal school, assembly-room, handsome thermal establishment, etc. There are various ancient Roman remains. The chief attraction of the place is its warm sulphur springs, which have temperatures varying from 86° to 166° F., were much frequented the Romans, and are still in great repute for the cure of rheumatic and similar complaints. Its old name was *Aquæ Tarbellicæ*, and from *Aquæ* ("waters") comes its modern name. Pop. (1896) 8,307.

Day, Benjamin Franklin, American naval officer: b. Ohio. He was educated at the Naval Academy 1858-61, served in various capacities during the Civil War and became a rear admiral in March 1899, retiring in March 1900.

Day, George Edward, American Hebrew scholar: b. Pittsfield, Mass., 19 March 1815. He was educated at Yale and the Yale Theological Seminary, and entering the Congregational ministry was successively pastor at Marlborough and Northampton, Mass., 1840-51. He was professor of biblical literature at Lane Theological Seminary, Cincinnati, 1851-96, and of Hebrew at Yale 1866-95, and professor emeritus from the last named year.

Day, Henry Noble, American educator: b. Washington, Conn., 4 Aug. 1808; d. New Haven, Conn., 12 Jan. 1890. He was a nephew of Jeremiah Day (q.v.) and became professor of sacred rhetoric in Western Reserve College in 1830, and was president of the Ohio Female College in 1854-64. He published: 'The Art of Elocution' (1844); 'The Art of Rhetoric' (1850); 'Elements of Logic' (1867); 'The Science of Aesthetics' (1872); 'The Science of Thought' (1886); 'Elements of Mental Science' (1889).

Day, Holman F., American journalist and poet: b. Vassalboro, Me., 6 Nov. 1865. He was graduated at Colby College in 1887 and entering journalism the year after, has since been editorially connected with various Maine journals. He has contributed extensively to periodicals and is the author of two volumes of popular verse: 'Up in Maine' (1900); 'Pine Tree Ballads' (1902).

Day, Horace H., American manufacturer: b. 1813; d. Manchester, N. H., 23 Aug. 1878. He early entered the rubber industry, but was compelled to retire from it as a result of patent litigations with the Goodyear interests. In 1856 he had begun to advocate the utilization of the water power of Niagara Falls, a project, however, in which he expended large sums without return. He returned to the rubber industry, but ultimately lost his fortune.

Day, James Roscoe, American Methodist clergyman: b. Whitneyville, Md., 17 Oct. 1845. He was graduated from Bowdoin College in 1874, entered the Methodist ministry and was successively pastor in Portland, Boston, and New York. He is at present (1903) chancellor of Syracuse University.

Day, Jeremiah, American educator: b. New Preston, Conn., 3 Aug. 1773; d. New Haven, Conn., 22 Aug. 1867. He was graduated at Yale 1795. Having early made choice of the profession of theology, while acting as tutor he began to preach as a candidate for the ministry; but before taking charge of any parish, was in 1801 elected to the professorship of mathematics in Yale College. In 1817 he became president of the college, continuing in that position till his resignation in 1846. He published: 'An Introduction to Algebra' (1814); 'Navigation and Surveying' (1817); and other works.

Day, John, English dramatist: fl. about 1600. Of his life hardly anything is known. He is mentioned in Henslowe's 'Diary' in 1598 as an active playwright. But few of his earlier works have come down to us save 'The Blind Beggar of Bethnal Green.' Day collaborated freely with contemporary writers, as Chettle and Dekker. Ben Jonson in his conversations with Drummond of Hawthornden grouped him with some other admirable gentlemen and authors as a rogue and a base fellow. His best works that have reached us are a graceful comedy, 'Humor out of Breath'; and 'The Parliament of Bees,' a kind of allegorical masque in which all the characters are bees. "The very air," says Charles Lamb, "seems replete with humming and buzzing melodies. Surely bees were never so berhymed before." An edition of Day's works was privately printed by A. H. Bullen in 1881.

Day, Lewis Foreman, English decorative artist: b. London 1845. He was trained in the workshops of Clayton and Bell and for 30 years has designed wall decorations, textiles, glass, and various other manufactures connected with ornament. He has lectured on art topics frequently at the South Kensington Art Museum, and is the author of 'Principles of Everyday Art'; 'Nature in Ornament'; 'Stained Glass Windows'; 'Art in Needlework'; 'Alphabets Old and New'; 'Lettering in Ornament'; 'Text Books of Ornamental Design' (4 vols.).

Day, Richard Edwin, American journalist and poet: b. West Granby, Oswego County,

N. Y., 27 April 1852. He was educated at Syracuse University and was on the editorial staff of the *Syracuse Standard* 18 years. He has published: 'Lines in the Sand' (1878); 'Thor: a Drama' (1880); 'Lyrics and Satires' (1883); 'Poems' (1888).

Day, or Daye, Stephen, American colonial printer: b. London about 1610; d. Cambridge, Mass., 22 Dec. 1668. He was employed by the Rev. Joseph Glover to accompany him to America in 1638, to operate a printing press which he was going to set up in Massachusetts. Mr. Glover died on the voyage and the press was placed in the house of Rev. Henry Dunster, first president of Harvard College. The first book printed in the colonies was issued from it in 1640, and was entitled 'The Whole Booke of Psalmes, faithfully translated into English metre,' commonly styled 'The Bay Psalm Book.' The printing house was taken from him about 1648, and put into the hands of Samuel Green. See Thomas, 'History of Printing in America' (1810).

Day, Thomas, English writer: b. London 22 June 1748; d. 28 Sept. 1789. He was educated at Oxford, and was called to the bar but never practised. In 1778 he married a Miss Esther Milnes, who was willing to conform to his ascetic requirements. His principles led him to renounce most of the indulgences of a man of fortune that he might bestow his superfluities upon those who wanted necessities. He wrote, in prose and verse, on various subjects, but his name is kept alive chiefly by the well-known book written for the young, entitled 'History of Sandford and Merton.'

Day, William Rufus, American jurist: b. Ravenna, O., 17 April 1849. He was graduated from the University of Michigan in 1870, and from the law school of the same institution in 1872. In the latter year he was admitted to the Ohio bar, and began the practice of law at Canton, where he soon gained local and state distinction; in 1886 he was elected judge of the common pleas court of the 9th judicial district, being the candidate of both political parties. In 1889, President Harrison appointed him United States district judge for the northern district of Ohio, but he was obliged to decline the appointment on account of ill health. In 1897 he was made assistant secretary of state by his friend, President McKinley, and in April 1898 he succeeded Sherman as secretary of state, as such conducting all the negotiations of the Spanish war. Later in 1898 he resigned the secretaryship, and was appointed chairman of the United States Peace Commission to frame a treaty of peace with Spain, in which capacity he had a conspicuous and responsible part in all peace negotiations. He then returned to his law practice, but in 1899 was appointed to succeed Judge Taft as United States circuit judge, and on 26 Jan. 1903 was appointed to the Supreme Court by President Roosevelt.

Day, a word used with several different senses. Its most ancient meaning is the period of light ("natural day") as opposed to the period of darkness, and in this sense it is still quite commonly used. Its most common application, however, is to the period of light and that of darkness together, but even in this sense there are different days. The sidereal day is the time

WILLIAM R. DAY.
ASSOCIATE JUSTICE UNITED STATES SUPREME COURT.

DAY-LILY — DAYFLY

that elapses between two successive culminations (see **CULMINATION**) of any particular fixed star, or, in other words, is the time occupied by a revolution of the earth round its axis. The solar, astronomical, or apparent day is the time that elapses between two successive returns of the same terrestrial meridian to the centre of the sun. This period is not always of the same length, and its mean length gives us the mean solar or civil day. The 24 hours of the sidereal day are numbered in succession from 1 to 24, while the civil day in most countries is divided into two portions of 12 hours each. The abbreviations P.M. and A.M. (the first signifying *post meridiem*, Latin for afternoon; the latter *ante meridiem*, forenoon) are requisite, in consequence of our division of the day into two periods of 12 hours each. In this respect the mode of numbering the hours from 1 to 24 consecutively has an advantage, and in some countries is being introduced; in parts of Italy it has long prevailed. The Babylonians began the day at sunrise; the Jews and Greeks at sunset; the Egyptians and Romans at midnight, as do most modern peoples. Astronomers use a day of the same length as the civil, but commonly make it begin at noon and number the hours up to 24, though latterly midnight has been partly adopted as the starting-point.

If we take a day according to the second definition given above (that is, a sidereal day), its length, of course, is the same throughout the year (see **SIDEREAL TIME**). The solar day, in consequence of the varying rapidity of the earth in its orbit, and the obliquity of the ecliptic, is different at different times (see **SOLAR TIME**), and this difference is uniform throughout the earth; but the time of the natural day (or period of light) is different at the different points of the earth, according to their distance from the equator. The daily apparent revolution of the sun takes place in circles parallel to the equator. If the equator and the ecliptic coincided, the circle bounding light and darkness would always divide, not merely the equator, but all its parallels, into two equal parts, and the days and nights would be equal in all the parallels through the year; but at the poles there would be no night. Owing to the inclination of the earth's axis to the plane of its orbit (the ecliptic), the parallel of latitude in which the sun appears to move is continually changing; and therefore the equator alone (being a great circle) always remains bisected by the circle dividing light from darkness; so that the days and nights here are always equal; while the parallels of latitude, not being great circles, are not equally divided by the circle separating light from darkness, except at the time of the equinox, when the sun is moving in the equator; and, of course, at this time only are the days and nights equal in those parallels. As you approach the poles the inequality between the days and nights becomes continually greater, till, at the poles themselves, a day of six months alternates with a night of equal duration. The most distant parallel circles which the sun describes north and south from the equator are, as is well known, only $23\frac{1}{2}^\circ$ from it. The distance between the polar circles and the poles is the same. Therefore, as a little reflection will show, when the sun is in one of the tropics, all the polar circle in the same hemisphere will be within the illuminated region (because it will be within 90° of the sun)

during the whole of a diurnal revolution, while the other polar circle will be in the region of darkness. These circles, therefore, have one day of 24 hours, and one night of the same length in each year. From the polar circles to the poles the time of the longest day increases fast, and in the same measure the length of the longest night. Notwithstanding the inequality of the periods of light and darkness in the different parts of the earth, each portion of the earth's surface has the sun above its horizon every year precisely six months, and below it the same length of time.

A day, in law, includes the whole 24 hours from midnight to midnight. In reckoning periods of time from a certain event, the day on which the event occurred is excluded. On the other hand, if it be required to prove survival for a certain number of days, it will suffice if the person be alive for any portion, however small, of the last day. While an obligation to pay on a certain day would therefore be theoretically discharged by payment before midnight, the law requires that reasonable hours be observed—for example, if the payment (as a bill) is at a bank or place of business, it must be within business hours.

A lawful day is a day on which there is no legal impediment to the execution of a writ—that is, a day may be unlawful, *dies non juridicus*, either by common law, or specific statute. By common law Sunday is a day on which the service of a writ cannot legally be made. Other days have been made holidays by both State and Federal statute in this country, and no such legal holiday is a lawful day.

Day-lily, the popular name for a genus of lilies (*Hemerocallis*), natives of temperate Asia and chiefly of eastern Europe, grown in gardens. They have long radical leaves, and a branched few-flowered scape, with handsome large blossoms, the segments of which are united into a tube. The flowers are found in meadows and along streams throughout the Atlantic sea-coast from New Brunswick to Virginia, and west to Ontario and Tennessee. A species with bright yellow flowers (*H. flava*) is sometimes found near old gardens. The name of the genus is from Greek signifying "beautiful for a day." In Europe these plants are sometimes cultivated as fodder for cattle.

Day-Blindness, or **Hemeralopia**. See **VISION**, **DEFECTS OF**.

Day of Sections, in French history, 4 Oct. 1795, when the National Guard attacked the Convention in the Tuileries. The forces of the government, under command of Napoleon, disarmed the regiments in the different sections.

Da'yal. See **DRYAL-BIRD**.

Dayfly, a name sometimes used for the well-known Mayfly. A neuropterous insect of the family of *Ephemera*. The infant stages of larva and pupa are unusually long, often extending to 10 months; but the adult period is short, and is passed without taking food, and covers only a few hours, never more than a day. In the early summer Mayflies abound in great numbers about northern lakes and rivers, furnishing food for other insects, and for crustaceans and fish.

DEACONESSES — DEAD

Days of Grace. The time at which a bill is actually due and payable, except in the case of bills payable on demand or at sight, is three days after the time expressed on the face of it, and these three additional days are called days of grace. In England if the third day of grace falls on a Sunday, Christmas Day, Good Friday, or a national fast or thanksgiving day, the bill is payable the day before. In the United States, a bill or note becoming due on a Sunday or a holiday is payable on the first business day thereafter.

Dayton, Elias, American soldier: b. Elizabethtown, N. J., July 1737; d. there 17 July 1807. He joined the British forces in 1760 which were employed in completing the conquest of Canada from the French; and he subsequently commanded a company of militia, with which he marched on an expedition against the northern Indians. He took part in the important battles of Springfield, Monmouth, Brandywine, Germantown, and Yorktown. After the war he served several terms in the legislature of his native State.

Dayton, John, American colonial governor: b. about 1761; d. Charleston, S. C., 27 Nov. 1822. He held several government offices, was chosen governor of South Carolina in 1800 and again in 1808, and was afterward appointed judge of the United States district court, a position which he held until his death. He published: 'A View of South Carolina,' and 'Memoirs of the Revolution' in that State.

Dayton, Jonathan, LL.D., American statesman: b. Elizabethtown, N. J., 16 Oct. 1760; d. there 9 Oct. 1824. In 1778 he entered the American army as a paymaster. In 1791 he was elected by the Federal party a representative in Congress, in which capacity he served for three successive terms, during the last two of which he was speaker of the House. In 1799 he was elected to the United States Senate.

Dayton, William Lewis, American jurist and statesman: b. Baskingridge, N. J., 17 Feb. 1807; d. Paris 1 Dec. 1864. He was graduated at the college of New Jersey in 1825; and was admitted to the bar of his native State in 1830. In 1838 he was chosen one of the associate justices of the supreme court of New Jersey, which position he resigned in November 1841; and in 1842 was appointed by the governor to fill a vacancy in the United States Senate. At the expiration of his term he resumed the practice of his profession at Trenton; and in 1856 was nominated by the Republican national convention as their candidate for the vice-presidency of the United States, with Fremont as the candidate for President. He was attorney-general of New Jersey 1857-61, and was minister to France 1861-4.

Dayton, Ky., city in Campbell County, on the Ohio River, and the Chesapeake & Ohio Railroad. Some of the manufactures are watch cases, pianos, whiskey; and the public buildings are good churches and schools and the Speers Memorial Hospital. Pop. (1901) 6,203.

Dayton, Ohio, city and county seat of Montgomery county, at the confluence of the Great Miami and Mad Rivers and Stillwater and Wolf creeks. It is on the Erie; the Dayton and Union and the Pittsburg, Cincinnati, Chi-

cago and Saint Louis Railroads; 67 miles southwest of Columbia and 60 miles north of Cincinnati. There are 125 trains entering the city daily. The Union Station was opened to the public in July, 1900, and cost including tracks \$900,000. The city has an area of 103½ square miles.

Government.—The Mayor, Treasurer, Auditor, Solicitor, Board of Public Service, of three members, are elected by popular election. The Board of Public Safety, of two members, and the Board of Health are appointed by the Mayor and confirmed by Council. The City Council, composed of 13 members from 10 wards, is elected by popular vote, for two years, each member receiving an annual salary of \$250. It is a legislative body only. The supply of water for the city is almost inexhaustible in quantity and of almost absolute purity. In 1904 there were 133 miles of street mains, 1,300 fire hydrants, 15,503 service taps. The Fire Department has a force of 90 men, 14 engine-houses, 50 horses maintained at a cost of \$86,728.48 and with property worth \$375,000. A complete system of surface and under-ground sewerage, both Storm and sanitary, is provided. In 1904 there were 67.9 miles of Storm sewerage.

Municipal Finances.—On 31 Dec. 1903 the city's financial statement was as follows: Assessed value of taxable property, \$47,250,640; real value of taxable property (estimated), \$100,000,000; total bonded debt, including this issue, \$2,925,000; cash value of sinking funds, \$157,000; bonded debt of city (net), \$2,768,000; water works bonds included in total debt, \$908,000; tax rate per \$1,000 valuation, 28.60.

Banks and Banking.—There are seven National Banks and two Savings and Trust Companies. A report of the condition of the National Banks in 1904 showed that the aggregate capital stock was \$2,400,000; surplus, \$625,000; undivided profit, \$561,412.51; with a total of loans and discounts of \$7,708,178.75; deposits, \$7,580,288.51 and a circulation of \$563,700. One of the savings and trust companies has a capital and surplus of \$250,000 and the other a capital of \$275,000. The Clearing-House reports for 1903 were \$86,807,930.41; for 1902, \$76,491,771.15. The Internal Revenue receipts for 1903 were \$2,617,679.07. Dayton takes rank as foremost in building associations of any city of its size in the country. The large number of the 20,000 or more homes in the city have been built with the aid of these associations. There are 12 associations with an aggregate authorized capital of \$49,400,000 and capital assets \$13,013,841.11.

Manufacturing Interests.—While Dayton's manufacturing industries are widely diversified and include the manufacture of cash registers, railroad cars, water-wheels, agricultural implements, sewing machines, foundry work, etc., these are conducted on so large a scale that many establishments employ from 500 to 2,500 hands. According to the U. S. census of 1900, the average number of wage-earners in the city was 16,869; the total wages paid was \$7,959,792 and the value of the productions was \$35,697,695. Great progress was made since 1900 and careful estimates show that in 1903 the average of wage-earners had increased to 20,740 with a total wages paid of \$10,180,619 and the value of the products \$46,595,875.

DAYTON — DEACON

Street Railways.—A potent force in the development of the city has been the electric traction lines, of which Dayton has more than any other city in Ohio. There are nine lines, with a total mileage of 385 miles, which radiate in all directions through the populous and rich country of which Dayton forms the center. The city railway lines, three in number, have a total mileage of 70 miles and render excellent service.

Education.—The Dayton public school system has for many years enjoyed the reputation of being one of the best in the West. On 31 Aug. 1903 there were 48 schools, 23 district schools and one High School with 37 teachers and 1,058 pupils and with property valued at \$326,252. There is one Normal School with an attendance of 67, 22 Kindergartens with an attendance of 1,058, one Manual Training School with an attendance of 1,710, and one school for the deaf. The total value of school property and equipments was \$1,467,387. There are 10 Catholic Parochial Schools with 94 teachers and 3,023 pupils and two Lutheran Parochial Schools with 89 pupils and also three large colleges and seminaries for Catholic youth and four well-attended Business Colleges, one of which, the Miami Commercial College, was established in 1860. The Union Biblical Seminary is the training college of the United Brethren denomination of the United States and a very successful Arts and Crafts Society is doing excellent work. There are 90 churches in the city. Valuable adjuncts to the churches are the Young Men's Christian Association and the Young Woman's Christian Association and the Woman's League and a number of lesser church associations.

Public Library.—Dayton had the first library incorporated in the State, one having been established in 1805. The Public Library was opened in 1855 and is supported by public taxation, having an income of \$18,000 per annum. The total number of volumes recorded 1 Jan. 1904 was 63,133. There are five daily newspapers, each with weekly editions, besides 17 church and other publications. There are also three large church publication houses.

Hospitals.—The city hospitals include the Saint Elizabeth Hospital, the Miami Valley Hospital, and the Protestant Hospital which has a large central building known as the Frank Patterson Memorial of Operative Surgery, one of the most complete buildings for its purpose in the United States. The Dayton State Hospital for the insane is maintained by the State. The Hospital of the National Military Home which adjoins the city is the largest military hospital in the world and has an average of 600 patients, all of whom are Veteran Volunteer Soldiers of the Civil and Cuban War.

History.—The town was laid out in November 1795 by Gen. Israel Ludlow and was named after Gen. Jonathan Dayton. The first settlers arrived in the spring of 1796. Situated in the Miami Valley, one of the most fertile valleys in the United States, producing for many years great crops of corn, wheat, tobacco and numerous cattle, sheep and horses and with abundant water power to develop its industries, Dayton has grown to be the third largest manufacturing city in the State. With its industries so diversified, its banks and building associa-

tions so strong and uniformly successful and with its people so well educated, it is one of the richest and most prosperous communities in the Union.

Population.—(1880) 38,678; (1890) 61,229; (1900) 85,333; (1904), estimated 100,000.

A. D. WILT,
President Miami Commercial College.

Dayton, Tenn., city and county-seat of Rhea County; on the Cincinnati, New Orleans & Texas Pacific Railroad; about 75 miles southwest of Knoxville. It is in the centre of a coal-mining district; and iron, machinery, lumber, bricks, and flour are the chief manufactures. Pop. 2,120.

Dayton, Wash., city and county-seat of Columbia County; on the Touchet River, and the Washington & Columbia River, and the Oregon railroads. It is about 28 miles, in direct line, northeast of Walla Walla and 50 miles southwest of Colfax. It is situated in one of the best agricultural regions of the State, and its trade is largely in agricultural products and cattle. It contains stores, large flouring-mills, and well-built churches and schools. Pop. 2,300.

Daza, dā'zā, Hilarion, Bolivian general and ex-president: b. Sucre 1840; d. 28 Feb. 1894. In 1857 he enlisted as a soldier in the famous battalion of Col. Balsa, and was rapidly promoted. On 24 Nov. 1870, by an act of treachery he deprived President Melgarejo of office, and defeated him in an engagement 15 Jan. 1871. After that he was practically the arbiter of the destinies of the country for several years. By the *coup d'état* of 4 May 1876 he became president in place of Frias. The army deposed him 27 Dec. 1879. He went to France, but after a few years returned to Bolivia, and in that country was assassinated.

D'Azeglio. See AZEGLIO, MASSIMO TAPARELLI, MARQUIS D'.

Deacon (from the Greek *diakonos*, a servant), a person who belongs to an inferior order of ministers in the Christian Church. Seven were apparently first instituted by the apostles (Acts, chap. vi.), which number was retained a long time in several churches.

In the Roman Catholic Church, a sacred minister whose functions are to assist the priest in the liturgical service and in the administration of the sacraments; also in emergencies to baptize, to preach, and to administer the Eucharist. These three functions it is not lawful for the deacon to discharge without express authority from the bishop save in case of necessity. But in the first ages of the Church it was the deacon that gave the communion, in both species, to the faithful in the public liturgical service and at their homes in case of sickness. In the present usage of the Church the diaconate is, save in exceptional cases, simply a step toward the priestly state and office and for the deacon as such there is no recognized place in the economy of the Church.

In the English Church, also, the diaconate is merely a step toward the priesthood, and the deacon's duties are all in the way of assisting the priest. He preaches only by episcopal permission, and he cannot consecrate the elements

DEACONESSES — DEAD

of the Lord's Supper, or pronounce the absolution. No person can be ordained deacon before he is 23 years old, except by dispensation from the archbishop of Canterbury. The office of deacon in other churches varies considerably, and some, of course, have no functionaries bearing this name.

In the Methodist Episcopal churches, the junior order of the priesthood, the novitiate being first ordained a deacon, and then after a time, if satisfactory conditions have been fulfilled—such as progress in grace and gifts, and the probation of character—elevated to the full priesthood or eldership—the latter the highest order in the Church—the bishops occupying not a superior ecclesiastical order, but holding a merely supervisory office.

In the Presbyterian churches, the orders here are teaching elders, or ministers, ruling elders, generally called simply elders (these two orders looking over the spiritual affairs of the congregation); and deacons (now gradually being displaced in many places by managers), to attend to the more secular matters.

In the Congregational, Baptist, and other churches, deacons are spiritual officers ranking immediately after the minister, and looking after both the spiritual and the temporal concerns of the congregations.

Deaconesses, in the time of the apostles, were usually widows who assisted in the solemn baptism of women (by immersion), instructed female catechumens in the doctrines and usages of the Church, visited those of their sex who were sick or were in prison for the faith's sake, dispensed the alms of the faithful, and kept order in the women's part of the assembly room during the liturgical service. That the deaconesses were in the earliest times widows, and not maids or married women, appears from the curious fact that Saint Ignatius, disciple of St. John the evangelist, speaks of "virgins who are called widows"; as clear a proof of the original custom of choosing widows only to be deaconesses, as would be the formal declaration that such custom existed. For a long time it was required that the deaconesses should be not less than 60 years old; by the councils of Chalcedon and in Trullo the age of 45 years was made the minimum; by the Council of Chalcedon deaconesses were forbidden to marry; and no widow who had married a second time was ever admitted to the rank of deaconess. The institution of deaconesses was extinct in the western Church in the 10th century and in the Greek Church in the 12th; but it survives in churches of the Syrian rites.

The work done by the deaconesses in the early centuries is performed now, in the Roman Catholic, and in many of the Protestant Episcopal, churches by the nuns (see SISTERS). In the 19th century the order of deaconesses was revived in several of the Protestant churches. Theodore Fliedner (1836) of the United Evangelical Church of Prussia, founded a home for deaconesses, in Kaiserswörth, Prussia. Germany has several homes, and in 1855 the order was established in Baltimore, Md.

Dead, in nautical language, a word frequently employed as part of a designation or phrase having, in general, a meaning somewhat

opposite to that of active, effective, or real. The chief of such phrases are the following: Deadeyes: circular, flattened wooden blocks, without sheaves, and having eyes for lanyards, which form a purchase or tackle whereby the shrouds or other parts of fixed rigging are extended or set-up taut; dead-flat: the name for one of the midship-timbers; dead-lights: strong wooden shutters used to close cabin windows, on the approach of a storm, to protect the glass; dead-ropes: such as do not run in blocks; dead-wood: the term applied to the solid blocks of timber erected upon the keel throughout the sharp portions of a ship's hull at stem and stern, the chief object being to give solidity and strength to the ends of the ship.

Dead, Book of the, a name given to the great funerary work of the ancient Egyptians, who themselves entitled it 'Per-em-Hru,' "to go north from (or by) day." It is a collection of prayers and exorcisms composed at various periods for the benefit of the pilgrim-soul in his journey through Amenti (the Egyptian Hades); and it was in order to provide him with a safe conduct through the perils of that terrible valley that copies of the work, or portions of it, were buried with the mummy in his tomb. Such copies, hieroglyphic or hieratic, according to the age when they were executed, and made some to order, others for sale, constitute fully one half of the thousands of extant papyri. They are mostly corrupt and faulty in language. See BOOK OF THE DEAD.

Dead, Disposal of the. In every age and in all countries, the living have shown their respect for the dead by various modes of burial ceremony, and the religion and laws of all countries reflect in large measure this feeling of reverence for the memory of those who have gone before. The methods of disposal of the dead are many, and historic romance has preserved for us many interesting and pretty customs. In the main, however, three methods are largely employed by modern peoples—burial, embalming or its modifications, or cremation with its modifications. It is impossible to tell which method has the greatest antiquity, but probably simple burial antedated the others, since cremation and embalming usually imply a complex religious development. The Hebrews, the Greeks, and the Romans in the main, buried their dead, their burying-grounds having been located outside of town-walls; but cremation also was largely practised by the Greeks, and it has been thought that the Hebrews at one time likewise burned their dead. As is well known, embalming was widely customary among most of the nations of antiquity, although the Egyptians may be said to have been the foremost of those employing it.

The argument in favor of cremation is based principally on sanitary grounds, and despite the general sentiment against it, cremation has made considerable progress in the United States and other countries. There are crematories in many of the leading cities of America, and while much of the feeling against cremation has undoubtedly passed away, there is still great general dislike to burning of the dead.

Apart from methods of antiquity, the problem of disposing of the dead with least danger to the living is, from the medical point of view,

DEAD-LETTER OFFICE—DEAD SEA

one of great interest. Its discussion is by no means of recent origin, however, for the early Italians, French, and English contributed learned treatises on the subject. It would seem that from the scientific point of view most of the modern writers and those of the Middle Ages strongly favor cremation as one of the cleanest and most efficient modes of disposal of the dead, and it is a matter of history how the ancient Etruscans and others had their burial urns in which to keep the ashes of their forebears.

The now universal method of burial beneath the ground is condemned by practically all sanitarians, but it will probably be many generations before the custom is abandoned, if indeed it is ever to be given up.

As to actual dangers that may arise from dead bodies buried beneath the ground, it cannot be claimed that these are imminent. Disease is mainly transmitted from the living person, and now that we have more definite knowledge of factors involved in the transmission of disease, the boggy of danger arising from burial has little terror for us. It can hardly be claimed with much show of justification that such a water-born disease as typhoid can originate from the water that may percolate through the ground in cemeteries and ultimately reach a potable supply. This danger is theoretical rather than practical, and the amount of time spent in devising methods to prevent such contamination would be much more rationally employed in taking care of the excreta of the living. The contamination of the earth, the air, and the water is, therefore, really of secondary importance; yet it cannot be denied that, excepting some exclusive cemeteries the present methods of burial are disgusting; and in times of war or pestilence not only is burial disagreeable, but there is no doubt that contagion may arise from it, and hence special portable crematories have an undeniable place. See CREMATION.

Dead-letter Office. See POST AND POSTAGE.

Dead-lights. See DEAD.

Dead-men's-fingers, an English fishermen's name for the *Alcyonium*, a genus of polyps, the typical one of the family *Alcyonidae*, characterized by the polyps of the colony having eight hollow arms and eight mesenteries, and a skeleton composed of separate calcareous spicules. It contains many well-known species, such as *A. digitatum*, or sea-finger (dead-men's-fingers, known also to fishermen as dead-men's-toes, and cow's-paps), and *A. glomeratum*. A common species on the United States Atlantic coast is *A. carneum*. The name is also applied to certain species of branching sponges.

Dead-nettle, a common name applied to the genus *Lamium* of the natural order *Labiata*, mint family. It is an annual or perennial herb, of which there are about 40 species, all natives of the Old World. It has been naturalized in America, and several species are found in waste places and cultivated ground from New Brunswick to Florida and west to Ontario, Minnesota, and Arkansas. The best-known species are *L. purpureum* and *L. album*, which are used in the northern parts of Europe as pot-herbs. A species of the genus *Galeopsis* (*G. tetrahit*) is called dead-nettle, as is one of the species of *Stachys* (*S. palustris*). It was an old belief that the hairs of the dead-nettle, when dry, caused irritation to the exposed parts of persons com-

ing in contact with the plant, and that this, extending through the system, sometimes caused death; hence the name.

Dead Reckoning. See DEAD.

Dead Sea, the usual name given to a most remarkable lake in the southeast of Palestine, called in the Old Testament "The Salt Sea," "Sea of the Plain," or "East Sea"; by Josephus, "Lacus Asphaltites"; and by the Arabs now, *Bahr-Lût*, "Sea of Lot." It is 46 miles long, with a breadth of from 5 to 9 miles. Its surface, which is lower than that of any water known, is 1,202 feet below the level of the Mediterranean. The depth of the greater part of the northern section is about 1,300 feet; but at the south end the water is only from 3 to 12 feet deep. The shape is that of an elongated oval, interrupted by a promontory which projects into it from the southeast. The Dead Sea is fed by the Jordan from the north and by many other streams, but has no apparent outlet, its superfluous water being supposed to be entirely carried off by evaporation. Along the eastern and western borders of the Dead Sea there are lines of bold, and in some cases perpendicular, cliffs rising in general to an elevation of 1,500 feet on the west and 2,500 feet on the east. These cliffs are chiefly composed of limestone, and are destitute of vegetation except in the ravines traversed by fresh water streamlets. The northern shores of the lake form an extensive and desolate muddy flat, marked by the blackened trunks and branches of trees, strewn about and encrusted with salt. The southern shore is low, level, and marshy, desolate, and dreary. On this shore is the remarkable ridge of rock-salt, 7 miles long and 300 feet high, called *Khashm Usdom* (Ridge of Sodom). Lava-beds, pumice-stone, warm springs, sulphur, and volcanic slag suggest the presence here of volcanic agencies at some period; but some modern geologists declare that no active volcanoes have ever existed in this vicinity; and that the subsidence of the Jordan Valley occurred in the Tertiary Period. On the other hand it is claimed by modern travelers that the neighborhood of the Dead Sea is frequently visited by earthquakes, and the lake still occasionally casts up to its surface large masses of asphalt. The long-entertained belief that the exhalations from this lake were fatal is not founded upon fact. Within the thickets of tamarisk and oleander which here and there may be seen upon its brink, the birds sing sweetly, and they fly over and swim about on its surface; but the salinity of the waters is adverse to life, though some lower organizations are found in them.

The water of the Dead Sea is characterized by the presence of a large quantity of magnesian and soda salts. Its specific gravity ranges from 1172 to 1227 (pure water being 1000). The proportion of saline matter is so great that, while sea-water contains only 3.5 per cent of salts, the water of the Dead Sea contains upward of 26 per cent, or more than eight times as much as that of the ocean. In all lakes or collections of water without any outflow, the water acquires an infusion of salt, its feeders constantly bringing in this material, while none can go off by evaporation, even when the shores do not as here abound in salt and nitre. The evaporation is great as the heat is intense, and the sea rather contracts than increases. Rain hardly ever falls;

the water is nearly as blue and clear as that of the Mediterranean; and though its taste is horribly salt and fetid, a bath in it is refreshing. Owing to the great specific gravity of the water, it is almost impossible for the bather to sink in it, strive as he may. Several of those who have navigated and explored the sea have fallen victims to a fatal fever. For the story of the 'Cities of the Plain,' see Gen. xix.; but according to Capt. Conder, "it is now generally agreed that the Dead Sea and Jordan were formed by a great fault or crack in the earth's surface long before the creation of man, and that the district presents in our own days much the same aspect as in the days of Abraham. It is vain, therefore, to suppose that the 'Cities of the Plain' were beneath the present sea, though this view was held as early as the time of Josephus." Steamboats are now in use on this lake.

Deadeye. See DEAD.

Deadly Nightshade. See BELLADONNA.

Deadwood, S. D., city, county-seat of Lawrence County; on the Fremont, Elkhorn & Missouri Valley, and the Burlington & Missouri River railroads. It is one of the principal trade centres for the mining camps of the Black Hills. A considerable amount of the gold, silver, lead, and other valuable minerals found in the Black Hills is brought to Deadwood for smelting, refining, or reshipment. Besides the large smelter and the cyanide reduction works, there are manufacturing for mining implements and machinery, brick, and planing-mills. The Masonic Temple is a large building. The first permanent settlement was made in 1876. Pop. 3,524.

Deaf-mutes, persons both deaf and dumb, the dumbness resulting from the deafness which has either existed from birth or from a very early period of life. Such persons are unable to speak because they have not the guidance of the sense of hearing to enable them to imitate sounds. Most deaf and dumb persons can hear some sounds, and some can distinguish a difference of pitch who perceive no difference in articulations.

The Eustachian tube extends from the tympanum into the throat; and sometimes sounds are better distinguished by opening the mouth when the external opening only is obstructed, hence the habit of "listening with the mouth open." Deafness occurs in every degree, from that which merely impairs the accuracy of the ear in distinguishing faint or similar sounds to that state in which there is no more sensation in this organ than in any other; and sound is felt in almost every part of the body as a mere vibration. Among the causes assigned for congenital deafness are consanguineous marriages, hereditary transmission, scrofula, certain local or climatic conditions, ill-health of the mother during pregnancy, etc. Though mere consanguinity can hardly be regarded as of itself a cause of this defect, yet it is an established fact that a great proportion of the deaf and dumb are the offspring of consanguineous marriages, especially of marriages between first cousins. Deafness is frequently a family trait, though it has been shown that the defect comparatively seldom descends directly from parent to child, though present in various collateral members of the family. For the causes of acquired or accidental deafness, see DEAFNESS. Where partial or complete dumbness occurs and the sense of

hearing is perfect, it will often be found to have its origin either in extreme nervous debility or in some mental derangement, and not in defective organs of speech, which in those deaf from birth are almost without exception in their normal condition. In the greater proportion of deaf-mutes no defect is visible, or can be detected by anatomical examination. The necessity of communication, and the want of words, oblige the deaf-mute to observe and imitate the actions and expressions which accompany various states of mind and of feeling, to indicate objects by their appearance and use, and persons by some peculiar mark, and to describe their actions by direct imitation. In this way there is formed a natural sign language. This language, when employed by an insulated deaf-mute, will usually exhibit only the objects of the first necessity and the most common impulses, like the language of a savage tribe. When his ideas expand from age or observation he will find new modes of expressing them; and when his education is begun an intelligent deaf-mute will often express ideas in this language for which it is difficult to find expression in words. When a number of deaf-mutes are brought together in a single institution, selections and combinations of their various dialects are formed; the best are gradually adopted by all; and a new and more complete form of the language is the result. This process, systematically carried on for years in deaf and dumb institutions at Paris and elsewhere, under the observation and direction of intelligent supervisors, has produced a language capable of expressing all the ideas we convey by articulate sounds with clearness, though not always with equal brevity. This language appears to have remarkably close resemblance to that used by the Indians of North America. (See SIGN LANGUAGE.) The Teutonic race being less disposed to the use of gestures and less ready than certain other peoples of Europe in the acquisition of the sign language, has not been so prompt to adopt it as an auxiliary in the education of deaf-mutes.

In ancient times and even through the Middle Ages it was the generally received opinion that deaf-mutes were not capable of being educated, nevertheless a few exceptional cases have been noted. Aristotle, Pliny, and Lucretius refer to this class of defective persons, and they were held by the code of Justinian as legally incapable of entering into a contract. In ancient Rome two dumb painters attracted considerable attention. About 700 A.D., according to the Venerable Bede, Bishop John of Hagunstaldt (Hexham), taught a deaf-mute to speak. The humanist Agricola (q.v.) speaks of meeting a deaf and dumb man who had learned to write. In the middle of the 16th century, Pasch, a clergyman of Brandenburg, instructed his daughter, a deaf-mute, by means of pictures. The first effort of which we have a distinct account, was made by Pedro de Ponce, a Spanish Benedictine, who instructed three deaf-mutes, of noble families, to write and speak, in 1570. His system appears to have been adopted by a countryman of his, a monk, Juan Pablo Bonet, who, in 1620, published a treatise on the art of instructing the deaf and dumb, accompanied by a manual alphabet. In 1648 John Bulwer, physician, published the earliest work in English on the instruction of the deaf and dumb, entitled 'Philocophus, or The Deafe and Dumbe Man's Friend'; in 1644 he had already

DEAF-MUTES

published 'Chirologia, or the Natural Language of the Hand.' This was followed by Dr. W. D. Holder's 'Elements of Speech, an Essay of Inquiry into the Natural Production of Letters; with an Appendix Concerning Persons that are Deaf and Dumb' (1669). George Dalgarno, who was a native of Scotland, published in 1680, 'Didascalocophus,' or 'The Deaf and Dumb Man's Tutor.' To Dr. John Wallis (q.v.) is generally ascribed the merit of having been the first Englishman who succeeded in teaching deaf-mutes. The results of his labors on his first pupil were exhibited before the Royal Society in 1663; and in 1670 an essay of his on this subject was published. Contemporary with these philanthropists in England were Baron F. von Helmont and Dr. John Conrad Amman, in Holland, the latter of whom published in 1690 his celebrated work, 'Surdus Loquens.' Toward the middle of the 18th century various teachers arose in different parts of Europe. In 1743 the practicability of instructing deaf-mutes was first publicly demonstrated in France by Pereira, a Spaniard, before the Academy of Sciences, which gave its testimony to the success of the method. About the same time the Abbé De l'Epée, who devoted his life and fortune to this subject, introduced a system for the instruction of the deaf and dumb, which was taught with great success in the Royal Parisian Institution, and afterward still further developed by his pupil and successor, the Abbé Sicard. In 1778 the first public institution for the education of deaf-mutes was established at Leipsic, through the labors of Samuel Heinicke, the great upholder of the vocal, oral, or articulatory system. His followers admitted the use of the sign language in the early stages of instruction, but sought to banish it as early as possible, considering it as a rude language, incapable of improvement, and which retarded the expansion of the pupil's mind, and rendered it less necessary for him to attend to written language. They believed that no freedom in thought or in expression could be produced without articulation. Although the results of instruction by the French method seemed to disprove these views, yet the pupils of the Abbé de l'Epée and Abbé Sicard have been charged with being very mechanical in their use of signs, and having little power of original thought or sentence construction.

In 1760 Thomas Braidwood established near Edinburgh a deaf and dumb school on the articulating system, which was visited by Dr. Johnson during his tour in Scotland. It was removed in 1783 to Hackney, near London. A day-school for the instruction of deaf-mutes was established by Don Pascal de Pietro at Rome in 1784. The first public institution in Great Britain for the gratuitous education of the deaf and dumb was founded at Bermondsey in 1792 by Townsend and Mason. From this establishment originated the London Asylum in Kent Road, which was opened in 1807. In 1810 a school for affording instruction gratuitously to the dumb was founded in Edinburgh, and others of a similar description were subsequently established at Birmingham, Glasgow, Manchester, and other towns. The method employed most widely in Great Britain was for a considerable time nearly the same as that employed by Sicard in France, but the German oral system was afterward largely adopted, and in 1869

the method of Alexander Melville Bell was introduced. At the International Congress held at Milan in 1880 the oral system received almost unanimous approval, and its use was adopted in the deaf and dumb institutions of Italy, Germany, Holland, and Austria. The commissioner appointed by the French government to investigate the subject pronounced in favor of the oral method, in 1881; but later a mixed or intermediate method was advised by a congress on the subject. In 1817 the first American asylum for deaf-mutes was founded in Hartford by Thomas Hopkins Gallaudet, who followed a method comprising many of the best features of the Paris school with some others of great importance peculiar to himself. His son, Dr. E. M. Gallaudet, afterward founded, in Washington, a college for deaf-mutes. The New York Institution was founded in 1818, and the Philadelphia Asylum in 1820. The word institution or school supplanted the term asylum, when the teaching of deaf-mutes became recognized as properly a part of the general work of public instruction coming under the care of the individual States.

The Bell method of teaching deaf-mutes, which is known as the system of "visible speech," is now in extensive use. There is in Boston a training college for instructing teachers in this method. It was introduced into the Clark Institution at Northampton, Mass., in 1872. The characters of the alphabet on which this system is founded are intended to reveal to the eye the position of the vocal organs in the formation of any sound which the human mouth can utter. (See VISIBLE SPEECH.) Alexander Graham Bell (q.v.), son of the originator, and well known for his own scientific inventions, was the first to employ this alphabet in the teaching of deaf-mutes in America. The career of Helen Keller has done much to direct public attention to this method.

Articulation is learned by the deaf-mute as a set of movements and sensations in the organs of speech. It is taught by pointing out to the pupil the positions of the lips, teeth, and tongue, in pronouncing the vowels and consonants; by making him feel with his hands all the perceptible movements and vibrations of the throat and other organs which are requisite for their pronunciation; and by using diagrams, etc. He is then required to imitate these positions, and to force a quantity of air from the lungs sufficient to produce the sounds, and is taught to read the articulations of others, by observing the position of the organs and the countenance. The facility of doing this will depend much upon the pliability of the organs of speech, and the nature of the language to be learned. Some advocates of articulation believe that, by that portion of the pupils of every institution whose organs are pliable and who have some remnant of hearing (those termed *demisourds* in the Paris school), the acquisition may be made with a degree of ease and perfection which renders it an important branch of instruction for them. But they are equally convinced that to attempt to teach articulation to those entirely destitute of sensibility in the ear, or who cannot exercise the organs of speech without difficulty or pain, is a useless labor, and may produce disease in the pupil.

The sight of deaf-mutes is sometimes so well

DEAF-MUTES

trained that they prove very proficient in lip-reading; and if, in addition, their articulation is distinct they can carry on considerable conversation with persons who know nothing of the sign language or of the manual alphabet, cases being known where persons have conversed with the deaf and dumb and remained ignorant that those to whom they were speaking were afflicted in this way.

There are two kinds of manual alphabet, the double-handed alphabet, where the letters are expressed by the disposition of the fingers of both hands; and the single-handed, in which

Deaf-mute Alphabet. Single Hand.

Deaf-mute Alphabet. Double Hand.

the letters are formed with the fingers of one hand.

Spelling by the hand is not a part of the sign language but is frequently acquired in addition to the latter and is very commonly used, being an art easily acquired.

In 1903 much interest was aroused by the testing in New York of the acousticon, an instrument devised for enabling the deaf to hear. The inventor, Mr. Hutchinson, had previously exhibited it in England, and the tests in both cases appeared to be remarkably encouraging. The acousticon is a device involving all the important principles of the telephone, with improvements for giving intensity to sound waves. It is in three pieces, which may be carried in the pocket. The one answering to a telephone transmitter is a vulcanized rubber disk about three inches in diameter. To its back is attached a hook by which it may be suspended from a waistcoat pocket. The reverse face of the disk is hollowed and in the hollow certain gases are hermetically sealed. The other two pieces are the earpiece, which corresponds to the receiver of a telephone, and the battery. The latter is about three inches long, two inches wide and half an inch thick. Wires connect the three pieces of the machine. The sound that is to be transferred is caught by the receiver and intensified before it passes to the ears of the subject.

In 1901 Germany led the European states in the number of schools for the deaf, having 98. In France there were 70 such schools, in Great Britain and Ireland 46, in Italy 35, in Austria-Hungary 19, in Norway and Sweden 17, in Switzerland 13, in Russia 13, in Spain 7. There are about 23 other institutions for deaf-mutes in various parts of Europe, and India and Japan have established a few schools. In Canada there are 7, and the United States leads the world with 103 public and 15 private institutions of this nature. Fifty-seven of the public schools are State institutions and 46 are day schools. In the State institutions there were, in 1901, a total of 10,069 pupils. Some are taught by the manual method, others by the purely oral; but the larger number of schools prefer a combined method. Manual training is an important feature in schools for deaf-mutes. There are also six periodicals in the United States devoted to the interests of deaf-mute instruction. The proportion of deaf-mutes in the United States is 1 to 2,400. There were on 1 June 1890 a total of 121,178 deaf persons, of whom 40,592 were deaf-mutes, and 80,611 were able to speak. See DEFECTIVES, EDUCATION OF.

DEAF-MUTES — DEAL

Deaf-mutes, Teaching Speech to. The fact that deaf-born infants make the same babbling efforts to talk as hearing ones and also the fact that a few mothers by giving them the same repetition through their eyes, of the beginnings and progress of language, as they gave their hearing children through their ears, resulting in these deaf children acquiring articulate language and the ability to understand the spoken language of others, induced Emma and Mary S. Garrett to make the experiment of applying this same treatment to the deaf in general.

The experiment began 2 Feb. 1892, as a private effort, with 11 deaf children in a little old building in West Philadelphia, Pennsylvania. In July 1893 it became a State Institution under the title of Home for the Training in Speech of Deaf Children before they are of School Age, and between then and now two large cottages have been erected at Belmont and Monument Avenues, Philadelphia, Pa., on the confines of the Park, each capable of holding 30 children and both of which are constantly filled.

Deaf children are received between the ages of two and eight, the nearer the minimum age the better. Their training is made to conform as nearly as possible to the proper training of normal children. Their lack of hearing every word spoken in their presence, which is the way hearing children learn language, is supplied by intelligently giving them enough repetition of ordinary language through the eye to equal this. Except for this, their training is identical with that of normal children. No signs or motions are ever used to convey ideas to their brains; articulate speech alone is used. There are no vacations as there is no break in the summer in the acquirement of language by hearing children. The results are that all children who have completed the training are attending ordinary schools with hearing children; the only special thing required for them being a seat where they can see the teacher's face. Deaf boys, who after completing their preparatory training in the Home have been several years in public schools for hearing children, are learning their trades among hearing people among whom they must ply them. Reports from teachers and employers alike confirm the ability of these children to keep abreast of their classes in school and their fellow workmen in the shops.

These results would not be possible with deaf children deprived of any part of the opportunities which all hearing children enjoy for the development of the powers which they possess in common, nor can any better medium for this be devised than the natural one of articulate speech and language. These are also the medium of communication in the hearing world in which they must pass their lives, and a knowledge of them is indispensable to their usefulness and happiness.

There is no reason physical or mental for depriving deaf infants of learning articulate speech and language at the natural age and they evidence their aptitude to acquire them by babbling in earliest infancy just as hearing babies do.

MARY S. GARRETT,

Principal and Founder of Home for the Training in Speech of Deaf Children before they are of School Age, Belmont and Monument Avenues, Philadelphia, Pennsylvania.

Deafness, a condition in which there is loss of hearing, partial or complete, due to disturbance or destruction of some part of the hearing apparatus, either external or internal. Deafness may be acquired during life, or may be congenital. In most cases of congenital deafness, deaf-mutism results. (See DEAF-MUTES.) Of the acquired forms of deafness, those resulting from disease and destruction of some portion of the middle ear are the most common. Otitis media (q.v.), the commonest cause, may occur at all ages, and is a very frequent accompaniment of some of the acute infectious diseases, particularly measles, scarlet fever, and influenza. In these there is an inflammation in the nose and pharynx. The inflammation ascends the Eustachian tube and, being accompanied by some of the ordinary pus micro-organisms, notably the *Staphylococcus pyogenes aureus*, causes the formation of an abscess in the middle ear. This gives rise to severe earache, and finally to rupture of the drum and discharge of the pus. In many such cases recovery is complete, but in others there is partial destruction of the small bones of the conducting apparatus or even more important structures, resulting in partial or complete deafness. In the aged, chronic inflammation of the middle ear from nasopharyngeal catarrh is perhaps the most common cause of deafness. The middle ear contributes nearly three fourths of all cases of deafness, the external ear a little less than a quarter and the internal ear a very minute remainder.

Deak, dā-āk', Ferencz, Hungarian statesman: b. Söjtör, Zala, Hungary, 17 Oct. 1803; d. Budapest 29 Jan. 1876. Having studied law at Raab, he practised for some time as a barrister, but his political career began with his election to the National Diet in 1832. He soon became, in spite of his loyalist and conservative tendencies, a prominent member of the liberal opposition. At the revolution of 1848 he became minister of justice, but retired when Kossuth obtained power. On the defeat of the patriots in 1849 he retired from public office and did not return till the Franco-Austrian war gave him an opportunity of serving his country. He is regarded as the master-spirit of the movement by which the ancient independence of his country was restored in 1867. Though the leader of the liberal party, he constantly refused office, but no change in the ministry was made without his consent. See Forster, 'Francis Deák, Hungarian Statesman' (1880).

Deakin, Alfred, Australian cabinet officer: b. near Melbourne, Victoria, 3 Aug. 1856. He was educated at Melbourne University; was minister of public works and water supply, 1883-6; solicitor-general 1885; chief secretary 1886-90; member of federal council 1889-95-97-99; and has been attorney-general of the commonwealth of Australia from 1901. He has published 'Irrigation in Western America' (1885); 'Irrigation in Egypt and Italy' (1887); 'Irrigated India' (1892); 'Irrigation in Australia' (1893); 'Temple and Tomb' (1894).

Deal, in the United States, a plank 12 feet long, 11 inches wide, and 2½ inches thick. Deals are sawed of other sizes, but are reduced to that cubic dimension in computing them. The name deal is applied in Europe to boards of fir above 7 inches in width and of various lengths exceeding 6 feet. If 7 inches or less wide they are

called battens, and when under 6 feet long they are called deal-ends. The usual thickness is 3 inches, and width 9 inches. The standard size, to which other sizes may be reduced, is $1\frac{1}{2}$ inch thick, 11 inches broad, and 12 feet long. Whole deal is deal which is $1\frac{1}{2}$ inch thick; slit deal, half that thickness. Deals are exported from many parts of Europe and the American continent. In the timber trade 50 cubic feet of deals are a load, and 100 feet superficial are a square.

Dealfish, deep-sea bony fishes of the family *Trachypteridae*, allied to the oar-fish and the ribbon-fish (qq.v.). As the name suggests, the elongated body is laterally compressed, and with the exception of a small separate elevated anterior portion, the dorsal fin is continuous along the back. The anal fin is absent. The tail-fin is peculiar in being sharply turned upward. The skeleton is very fragile. Some eight species are known from specimens accidentally thrown ashore on European coasts and from the west of South America.

De Amicis, Edmondo. See **AMICIS, EDMONDO DE.**

Dean, Amos, American jurist: b. Barnard, Vt., 16 Jan. 1803; d. Albany, N. Y., 26 Jan. 1868. He early acquired eminence in his profession and after being professor of medical jurisprudence in the Albany Medical School and of law in the Albany Law School, became chancellor of the University of Iowa in 1855. Among his published works are: 'Lectures on Phrenology'; 'Manual of Law' (1838); 'Medical Jurisprudence' (1854); 'Bryant and Stratton's Commercial Law' (1861).

Dean, John Ward, American genealogist: b. Wiscasset, Maine, 13 March 1815; d. Medford, Mass., 22 Jan. 1902. He was educated in the public schools of Portland, Maine, learned the bookbinding trade and conducted a bookbinding business in Boston for many years, till his appointment in 1872 as librarian of the New England Historic Genealogical Society. Save from 1889 to 1893 he filled this position until his death. He was editor of the 'New England Historical and Genealogical Register,' and of nine volumes of the 'New England Biblioplist' 1880-98. Among his writings are numerous biographical memoirs, including the 'Memoir of Nathaniel Ward' (1868); 'Memoir of Michael Wigglesworth' (1871); and the 'Story of the Embarkation of Cromwell and his Friends for New England.'

Dean, in ecclesiastical language, a church dignitary presiding over the chapter of a cathedral. The word is from the French *doyen* and from the Latin *decanus*, one set over 10 (Gr. *deka*, Lat. *decem*, 10). Originally *decanus* was the designation of a petty civil functionary: its ecclesiastical use had its rise in monachism, where a *decanus* was named to be chief and monitor of 10 monks or 10 hermits; and the senior *decanus* of a *canonibus* served as head of the monastic community in the absence of the abbot. From the institution of canons regular, serving in the chapters of cathedral churches, came the usage of naming the chief among the canons of a chapter as its dean. Rural deans are parish priests who, appointed by the bishop, exercise a certain jurisdiction and supervision over the churches or congregations and their rectors within a definite district in a diocese. In the

Curia Romana, the dignity styled Cardinal Dean of the Sacred College is the chief among the cardinals and is usually the oldest of the seven cardinal bishops: he succeeds his predecessor in the see of Ostia. From ecclesiastical usage the term dean was adopted as designation of the leading member of various secular bodies, for example, the head of a university faculty, or a college, or of a guild.

In the Church of England some of the deaneries are valuable benefices. A dean may hold one other living along with his deanery. He is bound to reside eight months of the year at his cathedral. The Bishop of London holds the honorary office of dean of the chapel royal, and there is also a sub-dean and chaplains. Rural deans are beneficed clergymen appointed by the bishop or archdeacon to exercise jurisdiction in certain matters in some part of the diocese. This office had fallen into disuse, being superseded by the appointment of archdeacons, but has latterly been revived. The rural deans hold office during the life of those by whom they are appointed. There are also a few deans called deans of peculiars, who exercise an independent jurisdiction, and are not under a bishop. Deans of colleges are, in English universities, officers appointed to superintend the behavior of the members, and to enforce discipline. In the universities of Scotland and elsewhere the head of each of the faculties of law, theology, medicine, science, etc., is called dean of the faculty. The dean of guild in Scotland is a burgh official whose duty it is to see that buildings are erected in accordance with the municipal regulations. In Scotland the honorary title of dean of the chapel royal is bestowed on a clergyman of the Established Church, and six chaplains are also appointed to a similar honorary office. In universities in the United States the dean of a department is the registrar or secretary, and in some institutions he has considerable to do with the discipline.

Deane, Charles, American antiquarian: b. Biddeford, Me., 10 Nov. 1813; d. Cambridge, Mass., 13 Nov. 1889. He was for many years a merchant in Boston but retired from business in 1864 and devoted himself to the collection of works relating to American history. He edited 'Bradford's History of Plymouth Plantation' (1856); 'Wingfield's Discourse of Virginia' (1860), etc.

Deane, Silas, American diplomatist: b. Groton, Conn., 24 Dec. 1737; d. Deal, England, 23 Aug. 1789. He was graduated at Yale College in 1758, and was a member of the first Continental Congress in 1774. He was sent by Congress to France as a political and financial agent, with instructions to ascertain the temper of the French government concerning the rupture with Great Britain, and to obtain supplies of military stores. But he did not confine himself to his instructions, but made promises and engagements on all sides, which afterward brought the Congress into considerable embarrassment. When it was determined to send ministers to negotiate treaties, Dr. Franklin and Arthur Lee were commissioned to join him at Paris, and he assisted in the negotiation of the treaty with France. In consequence of the extravagant contracts he had entered into, he was recalled 21 Nov. 1777, and John Adams appointed in his place. He left Paris 1 April 1778, and upon his return, being called upon to give an account of

DEANS — DEATH

his proceedings on the floor of Congress, evaded a complete disclosure upon the ground that his papers were in Europe. He then attacked his fellow commissioners and Congress itself in a public manifesto for the manner in which he had been treated, but did not succeed in removing the public suspicion from himself. He afterward published in 1784 'An Address to the Free and Independent Citizens of the United States' on the same subject, and returning to Europe, died in great poverty. See 'Papers in Relation to the Case of Silas Deane' (1855).

Deans, Jeanie, the heroine of Sir Walter Scott's tale, 'The Heart of Midlothian.' When her sister Effie was sentenced to death for the murder of her own child, Jeanie went on foot to London and obtained from the queen a pardon for her sister. Her devotion forms a contrast to the attitude of the father, David Deans, whose rigid sense of justice leads him, in spite of the dictates of his heart, to drive Effie from his door. Effie is married to her lover and becomes a lady of the court.

Dearborn, Henry, American soldier: b. Hampton, N. H., March 1751; d. Roxbury, Mass., 6 June 1829. He was practising medicine at Portsmouth when, on hearing the news of the battle of Lexington, 20 April 1775, he immediately marched with 60 volunteers, and was at Cambridge early the next day, a distance of 65 miles. He was made a captain, was at the battle of Bunker Hill 17 June, and accompanied Arnold on the expedition through the woods of Maine to Quebec. He served as major under Gates at the capture of Burgoyne, and distinguished himself and his regiment by a gallant charge at the battle of Monmouth in 1778. In 1779 he served in Sullivan's expedition against the Indians, in 1780 with the army of New Jersey, in 1781 at Yorktown, and in 1782 was on garrison duty at Saratoga. He was twice member of Congress, and for eight years, during the presidency of Mr. Jefferson, secretary of war. In 1809 he was made collector of Boston, and on 27 Jan. 1812, became senior major-general in the United States army. Resigning his commission in the army in 1815, he was appointed, 7 May 1822, minister to Portugal, where he remained two years, and was recalled at his own request.

Dearth, Henry Golden, American painter: b. Bristol, R. I., 1863. He studied at the Ecole des Beaux Arts in Paris; and among his works are 'Evening' and 'Autumn.'

Death, in common language, a state opposed to life, and considered as the cessation of it. Strictly speaking, we can trace only the cessation of organic life. The matter of which the body is composed does not perish on the death of an organized being; it undergoes various changes, which are known by the names of decay and putrefaction, and which are the preparation for its becoming subservient to new forms of life. What becomes of the mind, or thinking principle, whether in man or animal, after death, is a matter of philosophical conjecture or religious faith. The investigations of science do not throw the least light upon it. The change here adverted to, which is called death, does not take place so quickly as is generally believed. It is usually preceded and caused by disease or the natural decay of old age. The state called death takes place suddenly only when the heart or the brain is injured in certain parts. Probably the brain

and the heart are the parts from which, properly speaking, death proceeds; but as the cessation of their functions is not so obvious as the cessation of the breath, which depends on them, the latter event is generally considered as indicating the moment when death takes place. In the organs of sense and motion the consequences of death first become apparent; the muscles become stiff; coldness and paleness spread over the whole body; the eye loses its brightness, the flesh its elasticity; yet it is not perfectly safe to conclude, from these circumstances, that death has taken place in any given case, because experience shows that there may be from certain causes a state of apparent death, in which all these circumstances may concur without the extinction of the vital spark. The beginning of putrefaction, in ordinary cases, affords the first certain evidence of death. Putrefaction begins in the bowels and genitals, which swell, become soft and loose, and change color; the skin also begins to change, and becomes red in various places; blisters show themselves; the blood becomes more fluid, and discharges itself from the mouth, nose, ears, eyes, and anus. By degrees, also, the other parts are decomposed, and, last of all the teeth and bones. In the beginning of decomposition nitrogen and ammonia are produced: in the progress of it, hydrogen, compounded with carbon, sulphur, and phosphorus, is the prevailing product, which causes an offensive smell, and the light which is sometimes observed about putrefying bodies. At last, only carbonic acid gas is produced, and the putrefying body then smells like earth newly dug. A fat, greasy earth remains, and a slimy soap-like substance, which mixes with the ground, and contributes with the preceding decompositions to the fertility of it. Even in these remains of organized existence organic life is not entirely extinct; and they contribute to produce new vegetable and animal structures. Putrefaction is much influenced by external circumstances, particularly air, heat, and water. When the body is protected from the action of such agents it changes into adipocere (q.v.); but this process requires a much longer time than common putrefaction. In very dry situations the body is converted into a mummy, in which state bodies are found in the arid deserts of Africa, and on the mountains in Peru. Some vaults are remarkable for preserving corpses from putrefaction. It is well known to every reader that particular substances counteract putrefaction; for instance, those used in tanning, and in embalming mummies.

The death-agony is the state which immediately precedes death, and in which life and death are considered as struggling with each other. This state differs according to the cause producing it. Sometimes it is a complete exhaustion; sometimes a violent struggle, and very irregular activity, which at last, after a short pause, terminates in death. In some cases consciousness is extinguished long before death arrives; in other cases it continues during the whole period, and terminates only with life. The person in this condition has already somewhat the appearance of a corpse: the face is pale and sallow, the eyes are sunken, the skin of the forehead is tense, the nose pointed and white, the ears are relaxed, and the temples fallen in; a clammy sweat covers the forehead and the extremities, the alvine discharges and that of the urine take place involuntarily, the respiration becomes rattling, interrupted, and at length ceases

DEATH

entirely. At this moment death is considered to take place. This state is of very different length; sometimes continuing for minutes only, sometimes for days. When the patient is in this condition nothing should be attempted but to comfort and soothe him. As long as the dying person is able to swallow, wine or other cordials may be given from time to time.

Signs of Death.—During death the larger physical processes, such as respiration and circulation, may first cease, but molecular activity may persist for some time, as is evidenced in the common observation of the growth of hair after death. The desirability of knowing the absolute signs of death is due not so much to the danger of burying the living, as to the possibility that efforts at resuscitation may not be adequately performed in cases of apparent death. The idea that at the present time people can be buried alive is more or less absurd; but it is very true that many cases of apparent asphyxia, notably following drowning or electrical shock, are recoverable if proper means are taken.

There are a number of conditions that simulate death. The commonest of these are catalepsy and trance states, partial asphyxia, and syncope or fainting. In catalepsy there is usually a loss of consciousness, the muscles of the body generally become very rigid, but the limbs may be readily moved and placed in various positions. The temperature is lowered, but the respiration and the heart-action, while reduced, are apparent. In trance the appearance of death is much more striking, consciousness is usually abolished, the face is pale, the limbs may be flaccid, and sometimes are rigid, the reflexes may be lost, and the pupils may be dilated and immobile. The absence of the signs of decomposition, the normal ophthalmoscopic appearance of the fundus of the eye, and the persistence of electrical excitability are sufficient, however, for determining this condition. Partial asphyxia by drowning is one of the most frequent causes of apparent death. Resuscitation has resulted even after a body has been under water for an hour. This fact emphasizes the desirability of continued treatment in all cases of asphyxia by drowning. Ordinary fainting is readily distinguished from normal death.

The special signs of death are those that involve the circulation, respiration, conditions of the muscular system, and certain changes in the eye. Circulatory changes are those of stoppage of the heart, with consequent loss of heat and coagulation of the blood. Careful listening to the heart-sounds by means of specially devised instruments may be necessary to determine whether the heart has stopped beating or not, and special methods of applying ligatures to the lobe of the ear or the finger, cutting off the venous return and permitting the ordinary inflow to continue, may be used. The respiratory changes consist of cessation of respiration, with consequent change in the color of the patient, there being marked pallor in distinction usually to marked cyanosis of asphyxia. A mirror placed before the nose or over the mouth will sometimes detect breathing when it cannot be seen or heard; and if a vessel of water be placed over the chest, movements of that organ may be detected. Muscular changes are very characteristic. There is usually complete muscular relaxation, followed by great stiffness (*rigor mortis*) after a certain number of hours. There is com-

monly loss of excitability of the muscles. Changes in the eye are corroborative rather than unique. The iris is usually flaccid; the pupil is ordinarily moderately dilated and unresponsive to light, and is not reacted upon by atropine or eserine half an hour after death. There is a marked anaemia of the fundus of the eye when viewed with the ophthalmoscope.

Finally there are a series of cadaveric changes that result and which are indubitable evidence of death. There is gradual loss of heat, although in certain cases of cholera temperatures as low as 76° F. have been observed, and the patient has still lived. *Rigor mortis* develops, probably, by the action of a ferment resulting in the formation of myosin. This condition may come on very rapidly, sometimes in a few hours, but complete *rigor mortis* rarely takes place within this time. Occasionally there is an instantaneous *rigor mortis*, when death occurs suddenly during violent muscular exertion. This happens in times of war, when weapons are sometimes firmly grasped in the dead hand; and in some cases of drowning the patients may be found with weeds and mud clutched in the fingers. The disappearance of *rigor mortis* usually takes place in from 16 to 36 hours, although there is no absolute rule. Coagulation of the blood, post-mortem hypostases, post-mortem lividities, and putrefactive decoloration, with formation of gases, are usually characteristic and unequivocal.

Death in Mythology, etc.—The representation of death among nations in their earlier stages depends upon the ideas which they form of the state of man after this life, and of the disposition of their gods toward mankind. In this respect the study of these representations is very interesting. Of later ages the same cannot be said, because imitations of representations previously adopted are very often the subjects of the plastic arts in such periods. However, these representations do not altogether depend on the causes above mentioned, as the general disposition of a nation (for instance, that of the Greeks, who beautified every object) has also a great influence upon them. The Greeks represented death as a pleasing, gentle being, a beautiful youth. They personified death under the name Thanatos, while the Keres were rather the goddesses of fate and violent deaths, like the Valkyriæ in the northern mythology. According to Homer, Sleep and Death are twins, and Hesiod calls them the sons of Night. They are often portrayed together on cameos, etc. During the most flourishing period of the arts Death was represented on tombs as a friendly genius with an inverted torch, and holding a wreath in his hand; or as a sleeping child, winged, with an inverted torch resting on his wreath. Sleep was represented in the same manner, except that the torch and wreath were omitted. According to an idea originating in the East, death in the bloom of youth was attributed to the attachment of some particular deity, who snatched his favorite to a better world. It was ascribed, for instance, to Jupiter, or to his eagle, if the death was occasioned by lightning; to the water-nymphs if the individual was drowned, as in the case of Hylas; to Eos or Aurora if the death happened in the morning; to Selene, if at night, etc. These representations were more adapted to relieve the minds of surviving friends than the pictures of horror drawn by later poets and artists. (See Herder's 'Wie die Alten den Tod

DEATH-ADDER—DEATH VALLEY

gebildet.') Euripides, in his 'Alcestis,' even introduced Death on the stage, in a black robe, with a steel instrument in his hand, to cut off the hair of his victims, and thus devote them to the infernal gods. The later Roman poets represent Death under more horrible forms, gnashing his teeth, and marking his victims with bloody nails, a monster overshadowing whole fields of battle. The Hebrews, likewise, had a fearful angel of death, called Samael, and prince of the world, and coinciding with the devil; but he removes with a kiss those who die in early youth. The disgusting representations of Death common among Christians originated in the 14th century; for the representation of Death as a skeleton merely covered with skin, on the monument at Cumæ, was only an exception to the figure commonly ascribed to him among the ancients. In recent times Death has again been represented as a beautiful youth—certainly a more Christian image than the skeleton with the scythe. The monument made by Canova, which George IV. erected in honor of the Stuarts in St. Peter's Church at Rome, represents Death as a beautiful youth. He is sometimes portrayed under the figure of a dying lion.

Causes of Death—There are 15 principal causes of death, with the rate per 100,000, as given by the census bureau. They are as follows: Pneumonia, 191.9; consumption, 191.5; heart disease, 134; diarrhoeal diseases, 85.1; kidney diseases, 88.7; apoplexy, 66.6; cancer, 60; old age, 54; bronchitis, 48.3; cholera infantum, 47.8; debility, 45.5; inflammation of brain and meninges, 41.8; diphtheria, 34.4; typhoid, 33.8; and premature birth, 33.7. Death from all principal causes shows a decrease during the last two decades, the most notable instance being that of consumption, which shows a decrease of over 50 per cent per 100,000. The world's death-rate is estimated at 68 a minute, 97,920 a day, and 35,740,800 a year.

Death-adder (*Acanthophis antarcticus*), a very venomous and justly feared snake of Australia, which also occurs throughout the Indo-Malayan Islands to the Moluccas. It belongs to the *Elapida*, of which the cobra is also a member, but the death-adder lacks the spreading "hood." The end of the tail is flattened laterally, and is terminated by a horny spine, anterior to which are several rows of enlarged scales which, as well as the habit of elevating and rapidly vibrating this region, does not materially differ from the characteristic rattle of the American rattlesnake.

Death, Civil, formerly the entire loss or forfeiture of civil rights, which followed on attainiture for treason or felony. Formerly a man was considered civilly dead who retired into a monastery or abjured the realm. By Act 33 and 34 Vict. cap. xxiii. a conviction for treason or felony no longer causes attainder or forfeiture of civil rights.

Death, Dance of. See DANCE OF DEATH.

Death Duties. See INHERITANCE TAX.

Death-tick, a neuropterous insect of the family *Psocida*, of the size and appearance of the common plant-louse, one species of which is a visitor of gardens. Another species is the little book-louse found running over books and feeding on the paper. In England it is called "deathwatch," because there it is said to make a

ticking sound like that of the beetle (*Anobium*), thus exciting many superstitious notions. See DEATHWATCH.

Death Valley, a low desert in Inyo County, Cal., near the Nevada border. The name of this region was given by a survivor of an emigrant party of 30 who, in 1849 or 1850, lost their way here, and of whom, after enduring indescribable sufferings, 18 perished in the sands. No other such spot is known. Like all the great valleys of California, it lies oblong from north to south. Its length is about 50 miles; width about 35; surface about 210 feet lower than that of the ocean. The Panamint Mountains shut out from it the moist winds of the Pacific. In the August atmosphere there is less than one half of one per cent of moisture. The surrounding country is made up of volcanic ranges—black, red, green, yellow, and brown—which have furnished the valley with the borax now found there.

On the north of the valley is Ralston Desert, on the west Panamint Desert, on the south Mojave Desert, and Amargosa Desert is on the east. Death Valley has the lowest depression. Summer heat here rises to 137° F. or more, far higher than anywhere else in the Western world. Death Valley, as seen from the summit of the Panamint Range, presents in November a long gray waste desert, in which there are narrow bands of white made by thin deposits of borax; and to the south is seen a thin line like a blade of steel—the Amargosa River, as it dies away upon entering Death Valley sink. It is a sluggish, dead stream, and evaporation and absorption at last take it all.

The land was the centre of a system of lakes when the Sierra Nevada had not yet risen. Toward their summit, the Panamint Mountains are of carboniferous limestone formation, rifted and worn, with a very slight growth of piñon, pine, mahogany, and juniper, near the crests; and below the vegetation becomes more scant. In the gorges and narrow cañons are seen numerous vines and creepers, on which grow wild gourds resembling oranges, also similar to the bitter desert apples that grow near the site of ancient Sodom. Here also are the most distorted forms of the cacti, and an inferior growth of greasewood or palaverde. The wealth of this desert is wholly mineral.

A sand-storm playing in Death Valley is a wonderful sight. Sand-augers rise like slender stems, reaching up into the burning atmosphere for thousands of feet and terminating in a bushy cloud. They travel hither and thither and gradually fade from sight. Here mirage raises up spectral cities, groves, fields, and tree-margined rivers. A low ruin will seem to be hundreds of feet high; arrow-weeds are magnified into stately palms; and crows walking on the ground appear as men on horseback. Besides crows, here are seen a few poor jack-rabbits, mangy coyotes, buzzards, horned toads, red-eyed rattlesnakes, mice and mountain rats; and in the Panamint Range there are still a few bighorns or Rocky Mountain sheep.

At the summit of the Panamint and Funeral mountains, the thermometer at times, it is said, falls to 30° below zero. The mineral wealth of this region is great. In the Panamint Range are many mines of antimonial silver ore, and copper, gold, iron, travertine, onyx, and marble are also found. In the Funeral Range, gold, silver, lead,

copper, and antimony have been found in paying quantities, while the thick strata or measures of the east and southeast hills show almost inexhaustible quantities of colesmanite, a borate of lime named for W. T. Coleman, who was one of the first to discover this deposit and find out its richness in borax. Very rich gold quartz has been taken from mines along the route traveled by the ill-fated old emigrant party.

Human society in Death Valley is confined to a few miners in the Funeral, Calico, and Panamint mountains, some few roving bands of Piute Indians, and a few squaw-men owning cattle and horses.

Visitors to Death Valley should not go earlier than 15 October, nor later than 15 April; no one should attempt to cross it while a sand-storm is blowing; a gallon of water is needed for each person in a party, and three gallons for each horse. At present one can go from Dagget on the Atlantic & Pacific Railroad, but the route is little better than from Panamint to Furnace Creek and up through Nevada via Pioche, Nev.

Death's-head Moth, a species (*atropos*) of *Acherontia*, genus of the Sphinx or hawk-moth family, one of the largest of the group, widely distributed over the world, being found in parts of Africa, Asia, and Europe. It is crepuscular in its flight. Its fore wings are blackish-brown, with transverse lines of black and a white spot near the middle. The hind wings are yellow, with black stripes crossing the middle and tracing the margin. Upon the dark thorax is described in pale yellow a mask resembling a man's skull. Hence the common name. The moth is about five inches in extent of wings. The caterpillar is of the same length, of bright yellow color, with violet stripes and a row of blue spots along the back. It is injurious to potato and tomato plants, and in some localities is said to rob beehives of their honey, withstanding the attacks of the bees. When frightened or seized, the moth gives forth a squeaking noise. This, with the death's-head, suggests an evil omen to the superstitious, making appropriate the generic name *Acherontia*.

Deathwatch, a small blackish beetle, about a quarter of an inch long, of the genus *Anobium*, common in Europe and America. It receives its ordinary name from the ticking sound which it makes in the woodwork of houses — 6 to 12 distinct ticks being produced at regular intervals, like the clicks of a watch. These rappings are caused by the striking of the beetle's head on the hard wood, presumably to attract the attention of its mate. Both the beetle and the larvæ of several species are destructive of books, and are the real bookworms.

Debacle, dā-bā'kl (Fr. *débâcle*), a sudden breaking up of ice in a river; used by geologists for any sudden outbreak of water, hurling before it and dispersing stones and other debris.

Debain, Alexandre François, ä-lëks-ändr frän swä dē-bän, French musical inventor: b. Paris 1809; d. there 3 Dec. 1877. He was a maker of musical instruments and invented the harmonium in 1840.

De Bary, Heinrich Anton, hīn'rīn än'tōn dā bā'rē, German botanist: b. Frankfort-on-Main 26 Jan. 1831; d. Strasburg 19 Jan. 1888. After a course of medical studies he began in 1853 to practise in his native city, but next

year became a *privat-docent* in Tübingen, and the year after was called to be professor of botany at Freiburg, where in 1850 he was appointed ordinary professor. In 1867 he obeyed a call to Halle, and in 1872 to Strasburg, where he was the first rector of the newly reorganized university. As a botanist, De Bary is famous especially for the contributions he has made to our knowledge of the morphology and physiology of the fungi and the Myxomycetæ. Of his numerous works in these departments, the 'Comparative Anatomy of Phanerogams and Ferns' has been translated (1885); as also the 'Morphology of Plants' and 'Lectures on Bacteria' (1888).

Debat-Ponsan, Edouard Bernard, ä-doo-är bār-när dē-bā-pōn-sän, French painter: b. Toulouse 1847. He was a pupil of Cabanel, and although he has produced some noted historical works, is chiefly known as a genre and portrait painter. He won the second grand prize 1872, a medal of the second class 1874, receiving the ribbon of the Legion of Honor 1881, and a bronze medal in 1889. He signed his name Ponsan-Debat until 1880. Among his works are: 'A Story of Philetas' (1870); 'The First Mourning' (1874); 'Jephtha's Daughter' (1876), in the Carcassonne museum; 'St. Paul upon the Aropeagus' (1877); 'Devotion of St. Louis toward the Dead' (1879); 'A Door of the Louvre on St. Bartholomew's Day' (1880); and portraits of Dr. Pichaud (1874); Paul de Cassagnac (1882); Gen. Boulanger; etc.

Debatable Land, a district of country on the west border of Scotland and England, for a long time a cause of contention between the two countries and a refuge for outlaws.

Debay, Auguste Hyacinthe, French painter and sculptor: b. Nantes 20 April 1804; d. Paris 14 March 1865. He was a son of J. B. J. Debay the elder, and was a pupil of his father and of Gros. He took a medal of the third class 1819 at the age of 15, the second prize of Rome in 1822 with his painting 'Orestes and Pylades'; the first grand prize of Rome with his painting 'Ægisthus Discovering the Body of Clytemnestra,' and a first-class medal in 1831. From 1830 onward he exhibited in all the expositions at Paris, either as painter or sculptor. His principal pictures are: 'The Old Man and His Children'; 'Enlisting at the Place du Palais Royal'; 'The Meeting at the Field of the Cloth of Gold'; 'Attila'; 'Promenade of Sixtus Fifth'; and the 'Battle of Dreux.' As a sculptor he received honorable mention for his 'Napoleon I.' (1841); the first prize in open competition for the monument of Monsignor Affre, now at the Church of Notre Dame, Paris; and a first-class medal at the Exposition 1855 for his best-known work, 'Primitive Cradle'; first shown in 1845. Among other works are statues of Perrault and Claude Lorraine, at the new Louvre; and the marble mausoleum of the Comte and Comtesse de Damas.

Debay, Caroline Louise Emma, French painter: b. Paris 24 March 1809; d. there 6 Sept. 1832. She was a sister-in-law of A. H. Debay (q.v.). Among her works are: 'Christina of Sweden'; 'The Village Bride'; and the 'Young Girl Asleep.'

Debay, Jean Baptiste Joseph, French sculptor: b. Malines, Belgium, 16 Oct. 1779;

d. Paris 14 June 1863. He was first a pupil of the painter Van Biscoon, then went to Paris and studied under Chaudet. Summoned to Nantes, he made 30 busts for the library, 10 statues for the Exchange, the frontal of the Hotel de Ville, and the statues of Saints Peter, Paul, and John. Returning to Paris 1817, he made two colossal statues of Neptune and Apollo for Havana; and took a second-class medal with a bust of Talma. Among his works are: a bronze equestrian statue of Louis XIV. at Montpellier; statue of the 'Chancellor of the Hospital,' at Aigueperse; marble statue of 'Mercury putting Argus to Sleep' and 'Mercury Preparing to Slay Argus' at Havana; group of the 'Three Fates'; marble statue of Charles Martel, in the museum at Versailles; marble statue of Colbert; 'Young Woman and Shells,' considered his best work; and the figures of 'Ocean' and 'The Mediterranean' for one of the Place de la Concorde fountains. During his later years he held the position of restorer of sculptures at the Louvre. He received the decoration of the Legion of Honor 1825. He executed numerous portrait-busts in excellent style.

Debay, Jean Baptiste Joseph, French sculptor: b. Nantes 31 Aug. 1802; d. Paris 7 Jan. 1862. He was the eldest son of the preceding. He was a pupil of his father and of Bosio, and went to Havana at 17 years of age to deliver his father's statues. He took the second prize of Rome 1823, with a bas-relief, 'The Grief of Evander,' and in 1829 the first grand prize of Rome with the 'Death of Hyacinth.' He received the decoration of the Legion of Honor in 1851. Among his works are: 'Theseus'; 'Genius of the Sea'; 'Genius of the Hunt'; 'Young Slave,' first-class medal 1836; 'Anne de Bretagne,' Luxembourg Garden; a bronze statue of 'Cambronne' at Nantes; 'Marshal Oudinot' at Bar-le-Duc; 'Modesty and Love,' marble group; equestrian statue of Napoleon III., at Bordeaux; 'Six Apostles,' church of St. Eustache, Paris; and 10 statues for the Pommeraye Gallery at Nantes.

Debenture, in finance, a certificate or document signed by a legally authorized officer, as an acknowledgment of a debt due to some person; a deed or bond of mortgage on certain property for the repayment to a certain person of a certain sum of money advanced by such person, together with interest thereon at a certain stated rate. Debentures are frequently issued by public companies, especially railroad companies, for the purpose of raising money for the completion or carrying on of their undertakings.

In customs, a certificate entitling the person to whom it is granted to a drawback on certain goods exported, the duties on which had been paid.

In public offices, in some government departments, a term used to denote a bond or bill by which the government is charged to pay a creditor or his assigns the money due on auditing his account.

Deboe, William J., American lawyer: b. Crittenden County, Ky., 1849. He was graduated at Ewing College, Illinois, and at the Medical Department of the University of Louisville; practised medicine for a number of years; was admitted to the bar, and practised in Marion, Ky. He was a delegate to the Repub-

lican National Convention which met in Chicago and nominated Benjamin Harrison for the presidency in 1888, and was elected superintendent of the schools of Crittenden County in 1890. He was a member of the State senate 1893-6, and was elected to the United States Senate in 1897-1903.

Deb'orah, Hebrew seer or prophetess. She lived in the time of the Judges, and by the aid of Barak delivered the northern tribes from the oppression of Jabin, and secured a peace of 40 years' duration. The triumphal ode (Judges v.) attributed to her is a remarkable specimen of Hebrew poetry.

De Bow, James Dunwoody Brownson, American journalist and statistician: b. Charleston, S. C., 10 July 1820; d. Elizabeth, N. J., 27 Feb. 1867. He studied law, was admitted to the Charleston bar in 1844; became a contributor to the 'Southern Quarterly Review,' published at Charleston, and in 1844 took charge of that periodical as chief editor. Among other papers prepared by him for its pages was an elaborate article, published in 1845 upon 'Oregon and the Oregon Question,' which attracted much attention both in this country and Europe. It was translated into French, and was the occasion of a debate in the French chamber of deputies. In 1845 he removed to New Orleans, and established 'De Bow's Commercial Review.' This enterprise proved successful, and the work attained a circulation greater than has ever been reached by any similar publication in the South. In March 1853 he was appointed superintendent of the United States census. In that position he collected and prepared for the press a large part of the material for the quarto edition of the census of 1850. He afterward compiled the volume entitled 'Statistical View of the United States,' a compendium of the 7th census. In 1853 he compiled from his review a work published under the title of 'Industrial Resources of the Southwest.'

Debraux, Paul Emile, pôl â-mêl dè-brô, French balladist: b. Ancerville, département Meuse, 30 Aug. 1796; d. Paris 12 Feb. 1831. He was an ardent Republican, and wrote for the common people lively songs of wine and love, sung everywhere in tavern and workshop. He was called "the Béranger of the rabble." His best-known songs are: 'Mt. St. John'; 'Belisarius'; 'Say, Do You Remember?'; 'The Soldier's Widow'; 'Marengo.' Béranger published a complete collection of his 'Songs.'

Debreczin, dā-brēt'sin, Hungary, a town on the edge of the great central plain of Hungary, about 113 miles east of Budapest. Its houses are mostly of a single story; and in wet weather the wide but unpaved streets become almost impassable from mud. The principal edifices are the Protestant church, and the Protestant college, with a library of 100,000 volumes, Roman Catholic church, town-house, Piarist college, gymnasium, several hospitals, etc. Both the manufactures and trade are important; the former consisting chiefly of coarse woollens, leather, soap, tobacco-pipes, casks, etc., and the latter being in tobacco, wine, flax, hides, wool, potash, cattle, cheese, etc. There are four large fairs annually, and the swine market is the largest in the kingdom. Debreczin is considered the headquarters of Hungarian Protestantism. The Protestant college, founded in 1792, is

DE BRY — DEBTOR AND CREDITOR

considered the best educational establishment in Hungary. This town suffered much in the wars between the Hungarians and the Turks, and afterward in the religious wars. Pop. (1900) 75,006.

De Bry, dè-brê, Theodor, Flemish goldsmith and copperplate engraver: b. Liège 1528; d. Frankfort-on-the-Main, Germany, 1598. He settled in Frankfort-on-the-Main about 1570, and established a printing-house there. The most important of the works issued from his press is the collection of 'Voyages to the East and West Indies,' published in Latin (25 parts, 1590-1634) and German (27 parts 1590-1630).

Debs, Eugene Victor, American socialist. b. Terre Haute, Ind., 5 Nov. 1855. He received a common school education and became a locomotive fireman. He was elected to the Indiana legislature in 1885 and was later an official of the Brotherhood of Locomotive Firemen, and, from 1893 to 1897, president of the American Railway Union. He conducted the strike of 1893 in Chicago, and was later sent to jail for contempt, because of his management of the same, though he pleaded innocence of any crime and requested to be tried by a jury and be allowed to summon witnesses in his defence. Since 1897 he has been prominent in the Socialist movement, and in 1900 was the candidate of the Social Democratic party for President of the United States.

Debt, National, the amount which a State admits owing to those who have advanced money for the use of the government on occasions when its expenditure has exceeded its income. The amount of a national debt may not be the amount which the nation has borrowed; it is often greater, from the necessity of holding out inducements to capitalists, and also for the increment of interest. When money is bearing low interest, a nation may give its creditors the alternative of receiving payment or allowing a deduction from the nominal amount of their debt. The following table shows the public debts of the nations of the world at the end of the century:

COUNTRIES	Debt	
	Total	Per Capita
	Dollars	Dollars

Debtor and Creditor, Laws of. One of the earliest institutions among men is the right of holding individual property. Upon this right depends the power of making bargains and effecting exchanges. In various ways bargain-making gives rise to deferred engagements, and obligations are incurred which are called debts. These obligations rest upon a double foundation. The right of holding individual property implies the right of recovering any property which has been intrusted to others, or of claiming possession of any property which others have, for a valuable consideration, agreed to make over to us. The primary foundation of debts, therefore, is the right of holding property. A debt is a contract freely entered into. Whether the right of property is valid or not, it is commonly recognized by the person who incurs debt; no abstract doctrine of the rights of property, therefore, can properly come between him and his creditor to justify the violation of an engagement for which he has accepted an equivalent. Credit affords a means by which those who have no property of their own may acquire important advantages through the use of the property of others, and while proprietary rights are recognized, it is of great consequence to society that the obligations incurred in borrowing should be faithfully fulfilled. Hence a very great practical importance is to be attached to the moral obligation implied in the contract of a debt, independently altogether of any abstract or theoretical views which may prevail as to the soundness of the particular institution of proprietary rights on which that obligation may be founded.

In early and rude states of society the natural tendency is to regard all obligations as sacred and inviolable, and all who from any cause fail to fulfil them as criminal in act or intention, either by omission or commission, and liable to

DEBTS

the most severe and exhaustive punitive treatment. In such a state of society both the primary and secondary foundations of the obligation are likely to be held in extreme estimation. Hence in the earlier stages of society the laws against debtors are universally found to be of the most stringent kind, and as civilization advances, and the relations of society become more complicated, the necessity of repeated modifications of these severe laws becomes apparent. Any modification in favor of the debtor of the consequences of incurring debt, however equitable in itself, necessarily tends to increase the facility with which debt will be incurred, and if these consequences are over-relaxed society will be deprived of a needed protection; debt will be incurred carelessly, and as carelessness borders upon recklessness, and recklessness upon fraud, the lines of distinction between right and wrong dealing will become fainter, the protection due to misfortune, and the condonation necessary to be extended to miscalculation and errors of judgment will become a cover for deliberate conspiracy, and society will become a prey to an organized predatory system of modernized form of highway-robbery, thinly disguised under the forms of commerce. Such are the practical difficulties which the modern theory of the law of debtor and creditor has to encounter.

Among the Jews, under the Mosaic law, debt was treated with great stringency, but there were regulations adapted to discourage the incurring of it, and also some humane restrictions on the power of the creditor after it had been incurred. Lending on usury was forbidden, and the taking of pledges put under severe restriction. The alienation of the estate of an Israelite was also forbidden. The creditor, on the other hand, had power over the person of his debtor, and even over those of his wife and family, and could cause them to be sold in satisfaction of his claim. If the debtor was an alien he might be sold to perpetual bondage, but on the occasion of a jubilee, which was appointed to be proclaimed every 50th year, every Israelitish debtor was set free, and his property, if pledged or sold, returned to him.

Nothing is more common in rude states of society, and under arbitrary and despotic governments, than the liability of the person of the debtor for his debt. This is one of the original sources of slavery. Even in the comparatively enlightened states of Greece and Rome the power of the creditor over the person of his debtor was recognized by law. This power was abolished in Athens by Solon, who is said to have taken his reform from Egypt, where the same unjust law had already run its course. The early Roman law was even more excessive in its indiscriminating severity. By the law of the Twelve Tables the creditors might cut the body of the debtor in pieces and share it among them, they might also sell him and his wife and family to perpetual slavery. In the Middle Ages, notwithstanding the influence of Christianity, the debtor was treated with hardly less severity. Even the Church took the side of the creditor, and the debtor who died without discharge was excommunicated and deprived of Christian burial. As society became more refined the laws against debtors were again gradually ameliorated, but the process was a slow one. Imprisonment for debt in England, except

as an instrument for compelling the surrender of the debtors' effects, was only put an end to in the reign of Victoria.

In the United States originally imprisonment of debtors was adopted as a part of the common law, but at the present time imprisonment for debt, except in case of fraud, or of an absconding debtor, does not legally exist in any of the States. Congress, empowered by the United States Constitution to make a uniform bankrupt law, exercised this power, and subsequently repealed the law of imprisonment; and now, by Revised Statutes 990 and 991, no person can be imprisoned for debt by any process issuing out of the courts of the United States, in any State where by the laws of the State imprisonment for debt has been abolished. Most of the States, by constitutional provision, have prohibited arrest or imprisonment for debt, while the other States, either by direct statutes prohibiting imprisonment for debt, or by poor debtors laws, or by insolvent laws, secure the same result; it being held to be against public policy to deprive a man, by imprisonment, of the power to pay his debts, and make him a direct charge upon the State.

Debts, United States Public. These consist of the debts contracted by the nation, the States, and municipalities.

National.—The nation has contracted eight principal debts in its existence, which have overlapped each other and been complicated with incidental loans for special purposes. Five of these were for wars,—that of Independence, the War of 1812, the Mexican war, the Civil War, and the Spanish-American war; the present national debt is mainly for the Civil War. The other three were due to the commercial panics of 1837 and 1857, and the imminent silver bankruptcy of 1893.

At the close of the Revolution, the United States owed to foreigners \$10,313,505.91,—\$6,352,000 for French government loans, \$3,600,000 for Dutch loans, \$174,017.13 for Spanish bankers' private loans, and \$186,988.78 for 6 per cent certificates of indebtedness to French officers who had served in the Revolution. The domestic debt was upward of \$35,000,000; including some \$600,000 for funding of about \$6,000,000 Continental paper money at a cent on the dollar, and about \$2,000,000 in Continental bills of credit. Besides these, the States owed debts which, when they were taken over by the national government under the Constitution, 4 March 1789, were arbitrarily estimated at \$21,500,000, and actually assumed at \$18,271,786.47. At this time, the principal and arrears of interest on the foreign debt were \$11,710,378.62; of domestic debt, \$40,414,085.94 (nearly a third of it unpaid interest); making, with the bills of credit and the State debts, an aggregate officially stated in 1791 as \$75,463,476, at four and five per cent interest, and thus creating a total interest charge of \$4,587,444.81. This aggregate fluctuated around \$80,000,000 for many years, the new navy, the Barbary wars, and the Indian wars, etc., preventing much reduction. It reached a maximum of \$86,427,120 in 1804, as a result of borrowing part of the \$15,000,000 for the Louisiana Purchase. From thence to 1812 it was steadily paid off by an average installment of \$5,000,000 a year, till it had dropped to \$45,209,737. Then the war with England

DEBTS

intervened, and the debt was not finally closed out till 1834.

The War of 1812 cost \$80,500,073.50 in loans which yielded only some \$34,000,000, owing to the country's poor credit; and the debt in 1816 stood at \$127,334,933. Thenceforward till 1834 it was paid off by a sinking fund and redemptions, with only one interruption: in 1821 \$5,000,000 was borrowed to pay the award under the Florida treaty, and the debt rose \$3,500,000, to \$93,546,676. In 1830 it was \$48,565,406; in 1832, \$24,322,235; in 1833, \$7,001,698; in 1834, \$4,760,082; and the next two years saw only \$37,513 on the books, not at once redeemable. This extinction left some \$40,000,000 surplus in the treasury, of which \$37,468,819.97 was deposited unsecured in State banks. The consequent inflation and wild-cat banking, with Jackson's fluctuating and reckless financial methods, caused a crash and panic in 1837, and the fourth quarter's installment could not be, and never has been, repaid. The government had to borrow more money, and after this was paid new government enterprises were undertaken. From \$3,308,124 in 1838, the debt grew to \$23,461,652 in 1844, with a temporary increase of \$12,000,000 the year before; the next year \$7,500,000 were cleared off, and in 1846 the balance due stood at \$15,550,202. Then came the Mexican war: its cost, and the money paid for cessions of territory, raised the debt to \$63,061,858 in 1849, and to \$68,304,796 in 1851. Payments on the principal now began again, and in 1857 had reduced it to \$28,699,831. The panic of that year and the commercial depression thenceforward again forced a resort to borrowing,—\$20,000,000 at five per cent 1858, \$21,000,000 six per cents in 1860. This indebtedness was shortly afterward increased by the War loan. By 1860 the debt stood at \$64,842,287.

The history of the debt through the Civil War is a financial record which it is difficult to keep separate from a general history of currency, so many devices were utilized in the way of paper money, from postage stamps to interest-bearing bonds circulating as cash. The first loan was negotiated in February 1861, before the actual outbreak of the War. Of \$25,000,000 authorized, only \$18,415,000 worth of bonds were issued, at six per cent for 20 years; and even these could not command par. On 2 March \$35,364,450 in two-year six per cent treasury notes, receivable for customs, were issued. On 17 July 1861 the first great loan was authorized with full sense of the magnitude of the task before us: \$250,000,000 20-year seven per cents; the Treasury having authority to issue any part of it in three-year 7.30 per cent treasury notes (the "seven-thirties"), or in demand notes without interest not to exceed \$50,000,000, or in one-year 3.65 per cents. On 5 Aug. 1861 an issue of six per cent 20-year bonds was authorized in exchange for the one- and three-year bonds, and the demand notes made receivable for all government dues; this brought the latter from a condition of unsalability to the command of a premium, and the former were readily bought in exchange for the short-term notes. The issue of 7.30's reached \$140,094,750, the 3.65's sold largely, and the entire \$50,000,000 of demand notes were taken, while the 20-year six per cents had an issue of \$189,321,200. On 12 Feb. 1862, \$10,000,000 more demand notes were issued. In that month also the first of the

great popular loans was put on the market, the famous "five-twenties" (redeemable after 5, and payable after 20 years). They were six per cents, and the \$500,000,000 authorized was issued in full. Fifteen million dollars more were issued 1864-5. On the 25th of the same month, the first issue of "greenbacks" to the amount of \$150,000,000 was made, on 11 July another of equal amount appeared, and on 3 March 1863 still another,—\$450,000,000 in all. Of these, \$400,000,000 were made permanent, but contractions in 1868 and 1869 reduced their volume to \$346,681,016. Several acts, one of this same financially memorable February 1862, authorized the receipt of deposits at five per cent, and the amount was fixed at \$100,000,000 on 11 July; on 30 June 1864 another \$50,000,000 was authorized, at six per cent. These were all redeemable at 10 days' notice, and redeemed in 1865 and 1866. The success of these loans in 1861-2 had been marvelous; but their magnitude had strained the public credit and resources, and various other means were adopted. In March 1862 one-year six per cent certificates of indebtedness to public creditors were authorized, and \$561,753,241 were issued, all redeemed by 1866. In March 1863 the first fractional currency was authorized, postage stamps having been hitherto used as such; a \$900,000,000 gold loan was authorized, but only \$75,000,000 was issued; and \$400,000,000 more in treasury notes for one, two, and three years, of which \$477,595,400 was issued; namely in one-year five per cents, \$44,520,000; in two-year five per cents, \$166,480,000; in three-year six per cents, \$266,595,400. These notes were canceled or exchanged by 15 May 1868. In March 1864 the "ten-forties of 1864" were authorized: \$200,000,000 of five or six per cent gold bonds, redeemable in 10 and payable in 40 years. Of these, \$196,117,300 were issued at five per cent, and \$3882,500 at six per cent. In June 1864 the issue of the "five-twenties of 1864," six per cents, was authorized up to \$400,000,000, but only \$121,561,300 was issued. The same month, \$200,000,000 of 7.30 treasury notes were authorized, increased in March 1865 to \$800,000,000; in all, \$829,992,500 of 7.30's was issued; all were redeemed by July 1868. After this, several large loans in six per cent five-twenties were made, and loan certificates of deposit were issued; but as they were intended exclusively to redeem treasury or compound-interest notes, and did not increase the public debt, they belong to a history of government finance, not of the debt. In July 1870 a refunding act was passed, to enable the government obligations at high interest to be replaced by others at lower rates.

The amount of the national debt in 1862 was \$524,176,412; in 1863, \$1,119,772,139; in 1864, \$1,815,784,370; in 1865, \$2,680,647,870; in 1866, \$2,773,236,174. This was the climax; thenceforward, with interruptions only during the long depression of 1873-8, it steadily declined, till 1893. In 1881 it was \$2,053,353,961; in 1893, \$1,545,996,591. At this time the threatened bankruptcy of the Treasury, owing to the enormous accumulations of silver under the Sherman Act, compelled a fresh issue of bonds to preserve the national credit, by increasing the gold reserve. These were five per cents; in 1898 an issue of three per cents was made for the Spanish War. In 1902, exclusive of \$860,316,569 of certificates and treasury notes offset by an equal amount of cash in the Treasury, the debt was

\$1,314,929,599.89; in all \$2,175,246,168.89. Of this, the interest-bearing debt was \$915,370,230, and the interest charge about \$30,000,000, as against \$151,000,000 in 1865. Of course, not only has the principal of the debt declined, but the interest rates even more: government three per cents command a heavy premium, and by the act of 14 March 1900 the bonds of all rates were made convertible into two per cents.

State.—The latest returns of State bonded debts show a grand total of \$177,559,948. After the assumption of their debts by the national government, the States incurred none of moment till they contracted small loans to assist the government in the War of 1812. They did not attempt any considerable loans for internal improvements till about 1820, but in the next five years had aggregate debts of \$12,790,728. In 1830 the total had increased to \$26,470,417; in 1835 during the great western "boom," it had risen to \$66,583,186; and in the frantic speculation of the three years, 1835-8, \$107,823,808 were added to it. By 1840 it was over \$200,000,000. But the improvements in western lands thus effected, though in the main good and useful, and some of them since profitable, had far outrun the immediate ability of the property developed to pay for them: several States defaulted principal or interest, or both, and as the Constitution had forbidden States to be sued in the courts, the foreign bondholders were without recourse when they repudiated their obligations. The chief offenders were Pennsylvania, Maryland, Michigan, Indiana, Illinois, Mississippi, and Louisiana. America was an unsavory name in foreign parts, and none the less so that some of the State leaders attempted justifications which the creditors thought impudent dishonesty. From 1840 on, a strong effort was made to have the general government assume the debts once more; in December 1842 a select committee of Congress was appointed to report, which it did the following March; the total amount then was \$207,894,613.35, and the interest charge \$10,394,730.64. There were too many obstacles, and the plan fell through: the solvent and prudent States were not inclined to saddle themselves every few years with the obligations of those not so. As a fact, however, the States have not since abused their opportunities. The only cases of repudiation since have been among the Southern States plundered by the "carpet-bag" governments, and saddled with debts at once fraudulent and impossible of payment; though one or two have taken advantage of this plea to repudiate debts not owing to the carpet-bag régime and not difficult of payment. In 1880 the combined State debts amounted to \$250,722,081; so that they have been reduced by nearly one fourth within a generation, although not wholly by being paid. Nearly every State in the Union now has constitutional prohibitions from borrowing over a certain amount or percentage for public purposes.

Municipal.—The total debts of the 100 largest cities of the United States foot up about \$845,000,000; of which New York has considerably over one third, namely \$311,829,916. More than \$100,000,000 more is held by two others, Boston (\$51,869,954) and Philadelphia (\$50,055,395), the three together carrying nearly half the entire municipal debt of the country. None others have even half so much as either of the two latter: and singularly, the fourth in

the list, Cincinnati is only tenth in nominal, though higher in actual population. She has \$27,081,254; while Chicago, the second in population, has \$23,710,000. Cleveland, St. Louis, Baltimore, New Orleans, Buffalo, and Jersey City, in order, with \$18,000,000 to \$16,000,000, have together about \$103,000,000. These 11 cities have in all about \$568,000,000, or two thirds of the entire United States municipal debt. Washington, Newark, and Pittsburg are the only others which have over \$10,000,000. It must be remembered that there are sinking funds which heavily reduce this total; and that most of it has been contracted for conveniences or beauties which attract population and so reduce taxes. More than one fifth of the whole, indeed, is for water-works, which are not in any proper sense debts at all, as the water is paid for directly. The water-works systems of the country represent probably close on \$200,000,000 of investment. About six per cent is for parks and public places, nearly as much for bridges and harbor improvements, about 10 per cent for railroad aid, and nearly four per cent for public buildings. A great number of municipalities also are forbidden by law to incur above a certain fixed or contingent amount of debt.

Début, dâ-bû', a French word which has been adopted into the English language, signifying generally a beginning or entrance, but specially applied to the first appearance of an actor or actress on the stage, or to a first appearance in a particular theatre. In these circumstances, the actor is called a *débutant*; the actress, a *débutante*. The expression is very frequently used with reference to a young lady's first entrance into society.

Deca (Gr. signifying "ten"), a prefix of frequent occurrence; as in *Decapolis*, a group of 10 cities; *decalogue*, the 10 commandments; *decametre*, a measure of 10 metres, etc. From *deca* is formed *decade*, a collection or group of 10. In the calendar of the French Republic the term decade was used to designate the week of 10 days, which were severally named *primidi*, *duodi*, *tridi*, *quartidi*, *quintidi*, *sextidi*, *septidi*, *octidi*, *nonidi*, and *decadi*. See CALENDAR.

Decachord, dëk'â-kôrd (Gr. *dekachordos*, ten-stringed), an ancient Greek instrument of 10 strings, triangular in shape; also a kind of large guitar with 10 strings.

Decade (Latin, *decas*, from the Greek *deca*), a group or division of 10, especially a period of 10 years, a decennium. The books of Livy are divided into decades. In the French Revolution, decades, each consisting of 10 days, took the place of weeks in the division of the year. See CALENDAR.

Decadents, **The**, a school of artists and writers, the followers of which delight in the more or less morbid refinements of feeling and style, and pride themselves upon this perversion of taste. The decadent is fond of the products of declining civilization corrupted by many centuries of culture, of works too highly seasoned and vitiated, which presage the final dissolution of a social order fallen into decrepitude, and shuns the simple, the natural, the healthful, clinging only to the artificial and the complicated in life and character. The name of decadents may rightly be given to those who make a subtle virtuosity out of art. Among French writers

DECALOGUE—DE CANDOLLE

Baudelaire was the first theorist of this school, and his influence was felt by many writers of the "end of the century," such as the Goncourts and Maurice Barres. The decadents' school of poetry is best represented by Stéphane Mallarmé and Verlaine, and its disciples are numerous, including many men of undoubted talent who have combatted the stiffness and dryness of the Parnassians, not without success. They are often termed delinquents and symbolists; the latter term is well chosen as indicating their aims and manner.

Decalogue, the Ten Commandments, called by the Hebrews Ten Words, of which Decalogue (*oi δέκα λόγοι*) is a literal rendering. In all versions of these Ten Words whether as taken from Exodus xx. or from Deuteronomy v., there is essential verbal agreement; but the precepts are differently distributed by the Latin Church and the Lutheran on one hand, and the Greek Church and the Reformed on the other; and the Church of England stands with the Reformed, or the churches of Calvinian descent. What in the Roman Catholic and the Lutheran arrangement of the Decalogue is the first commandment is in the arrangement adapted by those other bodies the first and second; and what in the Roman Catholic and Lutheran arrangement is the ninth and tenth is for the others the tenth. In this distribution of the matter of the Decalogue some Protestant controversialists describe an endeavor on the part of the Roman Church to evade the prohibition of image-worship, in particular, because in a necessarily succinct popular formula of the first commandment no mention is made of images: "I am the Lord thy God: thou shalt not have strange gods before me." But it is replied that the inculcated division and distribution of the matter of the Decalogue is not peculiar to the Roman Church, for in the Talmud, the Targum of Jonathan, and in the writings of many rabbinical commentators the prohibition of worship of strange gods and the prohibition of worship of images are classed as one commandment, or one "word," the second, for they regard the proemium, "I am the Lord thy God, etc.," as the first "word" but they comprise in the tenth commandment the prohibitions of the 9th and 10th of the Roman Catholic scheme. The Lutheran scheme is in accord with that of the Latin Church, save that it follows the order of the prohibitions of covetousness given in Deuteronomy, not that in Exodus, which is the order followed by the Latin Church.

Decameron, *dē-kām'ē-rōn*, anything of 10 days' occurrence; also the title given to a collection of tales by Boccaccio, written in 10 parts, each part containing 10 stories, and being supposed to occupy one day in the narration. Boccaccio represents the stories as being told by seven ladies and three gentlemen, who had fled from Florence into the country to escape the fearful plague of 1348, and who had no other means of passing the time.

De Camp, John C., American naval officer: b. New Jersey 5 Oct. 1812; d. Burlington, N. J., 24 June 1875. He entered the navy in 1827; served in the frigate *Constitution* off the coast of Africa in 1854, and received the rank of commander the next year. During the Civil War he had command of the steam sloop *Iro-*

quois in the attack on Fort Jackson and Fort Philip, and served on the Mississippi under Farragut, distinguishing himself especially at Vicksburg. In 1868-9 he commanded the receiving ship *Potomac*, and was retired in 1870.

Decamp, Joseph Rodefer, American landscape and figure painter: b. Cincinnati 5 Nov. 1858. He was a pupil of Frank Duvenant in Munich and became a member of the American Society of Artists. His landscapes, though generally realistic in treatment, show the influence of impressionistic methods.

Decamps, Alexandre Gabriel, *ä-lëks-ändr gä-brë-el dë-kän*, French painter: b. Paris March 1803; d. Fontainebleau 23 Aug. 1860. He was educated in the studio of Abel de Pujol. When a young man he made a journey to the East, and returned from thence with a collection of sketches, from which he afterward produced some of his finest pictures. Among the more celebrated of these are: 'The Grand Bazaar'; 'Relieving Guard at Smyrna'; 'A Turkish Café'; 'Turkish Children Going Out of School'; and 'Arab Horsemen Passing a Ford.' Of pictures of another class are: 'The Shepherd and His Flock Overtaken by a Storm'; 'An Italian Village'; 'The Hawking Party'; 'Spaniards Playing at Cards'; 'Don Quixote and Sancho Panza.' Decamps also produced some historical and sacred pictures of a high order of art, including the 'Defeat of the Cimbri'; 'The Miraculous Draught of Fishes'; 'Joseph Sold by His Brethren'; 'The Finding of Moses'; and others. The leading merits of this painter are great originality of conception and vigor of expression, with a wonderful skill in the treatment of light and shade.

De Candolle, Alphonse Louis Pierre Pyrame, *äl-fōns loo-ë pë är pë-räm dë kään-döl*, Swiss botanist: b. Paris 28 Oct. 1806; d. Geneva 4 April 1893. He was a son of Augustin De Candolle (q.v.) and also published several works of note, the most important being: 'Geographical Botany' (1855) and 'Origin of Cultivated Plants' (1883). He also edited the 'Memoirs' of his father (1862).

De Candolle, Augustin Pyrame, Swiss botanist: b. Geneva 4 Feb. 1778; d. there 9 Sept. 1841. He studied chemistry, physics, and botany in Paris, where in 1797 his earliest work, on lichens, was published. Other works quickly followed, including his 'Astragalogia' (1802) and his valuable 'Essays on the Medicinal Properties of Plants' (1804). In 1802 he was elected to an honorary professorship in the Academy of Geneva, but remained in Paris, and delivered his first botanical lectures in the Collège de France in 1804. His 'French Flora' appeared in four volumes in 1805. Employed by the government, he visited all parts of France and Italy in 1806-12, investigating their botany and agriculture. The results of his journeys are partly embodied in a supplement to the 'Flore.' He was appointed in 1807 to a chair at Montpellier, where he lived from 1810 to 1816; he then retired to Geneva, where a professorship of botany was founded for him, and where he spent the remainder of his life. De Candolle was an industrious writer, and the fruits of his studies in systematic botany and the properties and natural affinities of plants are embodied in a considerable number of works. The greatest of

these, his 'Natural System of the Vegetable Kingdom' (Vols. I. and II. 1818-21), was commenced on too grand a scale, and was continued within more reasonable limits in the 'Preliminary View of the Natural System of the Vegetable Kingdom' (17 vols. 1824-73, the last 10 by his son and others).

Decap'olis, the name of an ancient country of Palestine, lying on both sides of the Jordan, and containing 10 principal cities, whence its name.

De Cassagnac, Paul Granier. See GRANIER DE CASSAGNAC, PAUL.

Deca'tur, Stephen, American commodore: b. Newport, R. I., 1751; d. Philadelphia 14 Nov. 1808. During the war of the American Revolution he commanded several privateers, and acquired some reputation by the capture of English ships. At the commencement of hostilities with France in 1798, he was appointed to the command of the Delaware of 20 guns, in which ship he cruised during the years 1798-99 on the American coast, and in the West Indies, capturing at different times the French privateers *Le Croyable* of 14, and *Marsuin* of 10 guns. In 1800 he commanded a squadron of 13 sail on the Guadeloupe station, the Philadelphia, a frigate of 38 guns, being his flag ship.

Decatur, Stephen, American commodore: b. Sinnepuxent, Md., 5 Jan 1779; d. near Bladensburg, Md., 22 March 1820. He was of French descent, the son of the preceding, and obtained a midshipman's warrant in 1798. He saw some service against the French, and was commissioned lieutenant in the following year. In the war with Tripoli (1801-5), he gained great distinction, his brilliant achievement of boarding and burning the captured Philadelphia in the harbor of Tripoli, and then escaping under the fire of 141 guns, Nelson pronounced "the most daring act of the age." For this he received his commission as captain in 1804; in 1810 he was appointed commodore. In the war with England in 1812 he captured the frigate *Macedonian*, but in 1814 he was obliged to surrender, after a resistance that cost him a fourth of his crew, to four British frigates. In 1815 he chastised the Algerines for their piracy, and compelled the bey to declare the American flag inviolate; and he obtained indemnities for violating treaty stipulations from the bey of Tunis and the pasha of Tripoli. He was appointed a navy commissioner in 1816, and was killed in a duel by Commodore James Barron.

Decatur, Ala., city, county-seat of Morgan County; on the Tennessee River and the Louisville & Nashville, and Memphis & Charleston railroads; 75 miles north of Birmingham. It has extensive manufactures of lumber, iron, flour, cotton, and leather. Pop. (1900) 3,114.

Decatur, Ga., town, county-seat of De Kalb County; on the Georgia Railroad; six miles east of Atlanta. It is a noted resort on account of its fine climate; is the seat of the Agnes Scott Institute for Young Ladies, and has newspapers and electric lights. A battle was fought here, 20 July, 1864, between a portion of Sherman's army, under Gen. Thomas, and the Confederates under Gen. Hood, the latter retreating at nightfall. Pop. (1900) 1,418.

Decatur, Ill., city, county-seat of Macon County; near the Saugamon River, and on the

Wabash, the Illinois Central, the Cincinnati, Hamilton & Dayton, and the Vandalia R.R.'s; 173 miles southwest of Chicago and 38 miles east of Springfield. It was settled in 1830 and in 1836 was incorporated. Decatur is in the midst of the famous Illinois corn belt, and is the trade centre of several counties. The chief manufacturing establishments are corn mills (the largest in the United States), railroad shops, iron works, flour mills, planing mills, agricultural implement works, engine and boiler works, casket and coffin factories, bridge works, and mantle factories. The Government census of 1900 gives the number of manufacturing establishments, 239; the capital invested \$3,632,263; the number of wage earners, 2,313; the annual wages, \$994,659; the cost of material, \$3,690,802; and the value of the products, \$5,896,492. The city has a large trade in grain, coal, live-stock, and manufactured products.

The principal public buildings are the Government building, the county court-house, the municipal buildings, Saint Mary's Hospital, the churches (about 25 buildings), and the schools. There is a good system of public schools, including a well equipped high school. There are two parish schools. The principal departments of the James Milliken University are located here. There are three National banks. The government is administered under a charter of 1886 which provides for a mayor, who holds office two years, and a city council. The majority of the administrative officials are appointed by the mayor. The city attorney, treasurer, and clerk are elected by the people. The city owns and operates the electric light plant and the water-works. Pop. (1890) 16,841; (1900) 20,754.

E. A. GASTMAN,

Supt. of Schools of Decatur, Ill.

Decatur, Ind., city, county-seat of Adams County; on the Saint Marys River, and the Toledo, Saint Louis & Kansas City and Erie railroads; 20 miles southeast of Fort Wayne, and near the eastern boundary of the State. Its principal industries are the manufacturing of lumber and machinery, and stone-quarrying. Pop. 4,142.

Decatur, Texas, town, county-seat of Wise County; on the Fort Worth & Denver Railroad; 45 miles northwest of Fort Worth. The town is the trade centre of an agricultural region, and its industries are chiefly those of a cotton-growing country, with the quarrying of limestone. The Northwest Texas Baptist College is located here. Pop. 1,562.

Decazes, Elie, â-lê dê-kâz, Duc, French statesman: b. St. Martin du Laye, Gironde, 28 Sept. 1780; d. Decazeville, France, 25 Oct. 1860. He gained the confidence of Louis Bonaparte, king of Holland, whom he served even after his abdication in 1810, but joined the cause of the Bourbons in 1814, and under the second restoration discharged the duties of prefect or police at Paris with marked ability. In 1818 he became home minister, and in November 1819, premier. On the occasion of the assassination of the Duke de Berry, in 1820, a deputy charged him openly with being an accomplice of the murderer; and Châteaubriand, then an ultra royalist, wrote in the *Conservateur*; "His foot slipped in the blood." He then resigned, when Louis

XVIII. made him a duke, and his ambassador to England, where he remained till December 1821. Under the reign of Charles X. he opposed the extreme measures of the government, and after the revolution of 1830, adhered to Louis Philippe. In 1834 he was appointed grand referendary of the chamber of peers, and in 1848 retired from public life.

Deccan, dĕk'kan, a term, rather of historical interest than of actual use, applied sometimes to the whole peninsula of Hindustan to the south of the Vindhya Mountains, which separate it from the basin of the Ganges; and sometimes restricted to that portion of the same which is rather vaguely bounded on the north by the Nerbudda, which falls into the Gulf of Cambay, and on the south by the Kistna or Krishna, a tributary of the Bay of Bengal. By Deccan peninsula is meant Hindustan.

Deceased Wife's Sister Marriage Bill, a bill to legalize marriage between a man and the sister of his deceased wife that has been brought up in almost every session of the British Parliament since 1835, when Lord Lyndhurst secured the passing of a bill, which declared all such marriages null and void. The bill legalizing marriage with a deceased wife's sister has passed the House of Commons several times, but till 1896 was invariably rejected in the House of Lords, with, however, decreasing majorities. In 1896 the bill was passed by the lords, but went no farther. The Colonial Bill passed in the House of Commons more than 20 years ago, and in the House of Lords during the session of 1898, to make marriages of this class legally contracted in the colonies legal also in England, and the Scotch Bill, having a similar object, has also never been carried, though there are not wanting high authorities who pronounce such marriages legal in Scotland even now, without any special permissive legislation. It may be added that marriage with a deceased wife's sister has been specially legalized under the sanction of the Crown in all the Australian colonies, in Canada, Barbadoes, Ceylon, Mauritius, New Zealand, South Africa, and Jersey. Bills similar to the English bill have also been passed in Natal. These were, however, refused ratification (by the Crown) for special or technical reasons. Throughout India marriages of this kind are universally legal among all sects and creeds, except British subjects whose domicile is Great Britain. In every Christian country in the world, except Great Britain, such marriages are legal.

Decebalus, the name of several Dacian kings, or perhaps a general title of honor borne by them. One of them, according to Dion Cassius, distinguished himself by his opposition to the Roman arms during the reigns of Domitian and Trajan. He entered the province of Moesia, defeated and killed Appius Sabinus, the Roman governor, and captured many important towns and fortresses. Domitian, whose prætorian prefect, Cornelius Fusus, Decebalus had defeated and slain in a disastrous battle, agreed to pay him a yearly tribute, which was continued by Nerva, but refused by Trajan, who subdued Dacia, assumed the victorious title of Dacius, while Decebalus, to escape falling into the hands of his conquerors, took his own life.

December, the 12th month of our year, from the Latin *decem*, ten, because in the Roman year instituted by Romulus it constituted the 10th month, the year beginning with March. In December the sun enters the tropic of Capricorn, and passes our winter solstice. This month was under the protection of Vesta.

Decemvirs, dĕ sĕm'vĕrz, the 10 men appointed to codify the laws of ancient Rome. Commissioners were sent to Greece to study Greek statute law, and on their return (302 B.C.) all the magistracies were suspended, and a commission of 10 patricians (*decemviri legibus scribendis*) appointed with consular powers to reduce the laws to writing. The finished code, after being ratified by the comitia of the centuries, was erected in the Forum inscribed on 10 tables of wood. Next year the decemvirate was renewed, and added two tables. The whole code was known as the Twelve Tables (q.v.). The president of both the decemvirates was Appius Claudius (q.v.).

Deception Island, a volcanic island belonging to the South Shetland group in the Antarctic Ocean, directly south of Cape Horn. Amid its ice-covered rocks lies a crater-lake, five miles in circumference, surrounded by hot springs.

Dechamps, Adolphe, ä-dölf dĕ-shän, Belgian journalist and statesman; b. Melle 17 June 1807; d. near Brussels 19 July 1875. Early in life a disciple of Lamennais, he subsequently became an orthodox Roman Catholic. From 1843 to 1845 he was minister of public works, and from 1845 until August 1847, when the triumph of the liberal party led to his secession, minister of foreign affairs. From 1837 to 1851 he conducted the Catholic 'Revue de Bruxelles,' founded by himself and Dedecker. He was an able administrator and an influential parliamentary speaker. He was the author of: 'L'Empire et l'Angleterre' (1860); 'La France et l'Allemagne' (1865); 'Le Prince de Bismarck et l'entrevue des trois empereurs' (1873).

Deciduous (Lat. *deciduus*, that falls down, from *decidere*, fall down, from *de*, down + *cadere*, fall), in botany, a term applied to various organs of plants, particularly leaves, to indicate their annual or periodic fall. When the calyx of a flower falls with the corolla it is called deciduous; when it falls on the expansion of the flower it is called caducous. Deciduous trees are those which for the most part annually lose and renew their leaves. In cold and temperate countries the fall of the leaf in autumn and the restoration of verdure to the woods in spring are among the most familiar phenomena of nature, connecting themselves also very intimately with the feelings, habits, and circumstances of mankind. The greater part of the trees and shrubs of temperate regions are deciduous; but within the tropics the forest retains always its luxuriance of foliage, except in countries where the dry season is extremely marked. There many trees lose their leaves in the dry season, and exhibit the same partial suspension of vegetative life. In warm countries the leaves of deciduous trees frequently remain for two or more years. Trees not deciduous are called evergreens, and evergreens never lose all their leaves at once.

Deciduous Teeth. See **TEETH**.

DECIMAL ARITHMETIC—DECKEN

Decimal Arithmetic, the common system of arithmetic, in which the figures or digits ranged in a row, increase in value by a multiple of ten as they are read from right to left, and decrease at a similar ratio from left to right. Also that part of the science of numerical calculation which treats of decimal fractions. See FRACTIONS.

Decimal Fraction, a fraction whose denominator is a decimal or power of 10. Thus $\frac{1234}{100}$

— is a decimal fraction. It may be decomposed into the sum

$$\frac{1000}{100} + \frac{200}{100} + \frac{30}{100} + \frac{4}{100}$$

$$= 10 + 2 + \frac{3}{10} + \frac{4}{100}$$

By an obvious extension of the method of local values, where each digit has 10 times the value of the like digit, which immediately succeeds it the above decimal fraction may clearly be written more concisely in the form 12.34, where the decimal point after the 2 merely serves to indicate which digit represents units.

In this abbreviated form a decimal fraction is termed a decimal. For the purpose of indicating the unit's place, other and less objectionable methods have been proposed. The operations of addition, subtraction, multiplication, and division may be applied to decimals in exactly the same manner as to integers; hence their great utility. They present, nevertheless, this disadvantage, that comparatively few fractional quantities or remainders can be exactly expressed by them; in other words, the greater number of common fractions cannot be reduced, as it is called, to decimal fractions, without leaving a remainder.

Common fractions, such as $\frac{1}{2}$, $\frac{3}{4}$, $\frac{1}{3}$, $\frac{2}{3}$, and $\frac{5}{8}$, for instance, can be reduced to decimal fractions only by multiplying the numerator and denominator of each by such a number as will convert the denominator into 10, or 100, 1,000, etc. (The common process is merely an abridgment of this.) But that is possible only when the denominator divides 10 or 100 without remainder. Thus, of the above denominators, 2 is contained in 10, 5 times; 4 in 100, 25 times; and 25 in 100, 4 times; therefore,

$$\frac{1}{2} = \frac{1 \times 5}{2 \times 5} = \frac{5}{10} = .5; \quad \frac{1}{4} = \frac{1 \times 25}{4 \times 25} = \frac{25}{100} = .25; \quad \frac{3}{4} = \frac{3 \times 25}{4 \times 25} = \frac{75}{100} = .75$$

But neither 3 nor 7 will divide 10 or any power of 10; and therefore these numbers cannot produce powers of 10 by multiplication. In such cases we can only approximate the value of the fraction.

Decimal System. See METRIC SYSTEM.

Decima'tion, in war, the selection of the tenth man of a corps by lot for punishment, as in case of a mutiny. It was early practised by the Romans. Sometimes every tenth man was executed; sometimes only one man of each company, the tenth in order, as was the case when the Saxons mutinied against Blücher before the battle of Waterloo.

The practice was followed by Essex at Dublin (1599), by the Austrians at Leipsic (1642), and by the French at Trèves (1675). The term is frequently used in a loose way for the destruction of a great but indefinite proportion of people, as of an army of inhabitants of a country.

Decip'ium, or **Decip'ium** (Lat. "deceptive"), a metallic element discovered by Delafontaine in the mineral samarskite, and also observed by him in sipylite. Decipium is not yet universally recognized among chemists as entitled to a place in the list of elements, but the symbol Dp has been assigned to it, and its atomic weight has been found to be about 171, if (as appears probable) its oxid has the formula Dp_2O_3 . If the formula of the oxid is DpO , then the atomic weight must be taken as about 106. Decipium is said to possess properties that are very similar to those of cerium and gadolinium. It forms colorless salts, the acetate being easily crystallizable. The double sulphate of decipium and potassium is insoluble in a saturated solution of potassium sulphate, and advantage has been taken of this fact to effect the separation of decipium from terbium.

Decius, Gaius, gā'yūs dē'shī-ūs, Messius Quintus Trajanus, Roman emperor: b. Bubalia, Pannonia: d. 251 A.D. He reigned from 249 A.D. to 251 A.D. He persecuted the Christians, and perished with his army in a bloody battle near Abricium against the Goths, through the treachery of Gallus, who succeeded him as emperor.

Decius Jubellius, Roman general. He was appointed to the command of the Campanian legion, which had been stationed at Rhegium for its protection 281 B.C. Under pretext that the inhabitants were intending to betray the garrison to Pyrrhus, he perpetrated the greatest atrocities. Shortly after, having been attacked by a disease in his eyes, he sent to Messina for a physician, who happened to be a native of Rhegium. The physician, to revenge the cruelties inflicted on his countrymen, prescribed an application, enjoining Decius to continue it, however painful it might be, till the physician again returned. The pain became insupportable, and at length Decius found that his sight was destroyed. To complete his punishment, the Romans gave effect to the complaints of the citizens, and he perished by his own hands in a Roman prison.

Decius Mus, mūs, Publius, Roman consul. In a war against the Latins 340 B.C., he devoted himself to death for his country, that is, after certain rites, rushed into the midst of the foes to certain death. His example was followed by his son, and, according to some historians, by his grandson. Such acts of self-devotion (*devotiones*) were not unusual at that time, when patriotism and piety exerted a powerful influence.

Deck, a horizontal platform or floor extending from stem to stern of a ship and covering in the hold. In ships of large size there are several decks one over the other. The topmost deck, which is indeed the main deck of a vessel, is called the spar or flush-deck; the portion of this which stretches from the foremast to the stem is called the forecastle. The quarter deck is in the stern.

Decken, Karl Klaus von der, kārī klōws fōn dār dēk'kēn, German African traveler:

DECKER—DECLARATION OF INDEPENDENCE

b. Kotzen, Mark of Brandenburg, 8 Aug. 1833; d. Africa 25 Sept. 1865. He entered the Hanoverian army, which he left after 10 years' service (1860) to follow his bent toward travel. On Barth's advice he went to Zanzibar, and started thence on a journey to Lake Nyassa, which failed through the treachery of his Arab guide. Next year he started on a second and successful journey to the mountain-regions of Kilima-Njaro. In the following year, with Kersten, he climbed that mountain to the height of 13,780 feet. In 1863 he made an extensive voyage along the east coast of Africa, after which he returned to Europe to plan a great expedition for the exploration of east African rivers. This journey ended in disaster, and Decken was murdered by a Somali.

Decker, Sir Matthew, English political economist: b. Amsterdam 1679; d. 18 March 1749. He went to London in 1702, and having embarked in commerce, attained the greatest success; was naturalized; received a baronetcy in 1716, and subsequently sat in Parliament. He published anonymously two pamphlets which were much discussed: one (1743) proposed to raise all the public supplies from a tax upon houses; the other, on the decline of Great Britain's foreign trade (1744), contained many good arguments for free trade.

Decker, Thomas. See DEKKER, THOMAS.

Declaration. (1) That part of the process or pleadings in which a statement of the plaintiff's complaint against the defendant is set forth, with the additional circumstances of time and place when and where the injury was committed, where these are requisite. (2) A simple affirmation allowed in certain cases to be taken instead of an oath or solemn affirmation. (See AFFIRMATION; OATH.) In the United States, the form of an oath is immaterial, provided it be such as the witness believes is binding upon his conscience. It is essential that the oath, declaration, or affirmation be administered in a manner prescribed by law. Mere technical variations do not affect the validity of an oath, and verbal deviations are immaterial. Perjury may be committed although the person was improperly sworn. No person will be permitted to make a declaration or affirmation unless he has conscientious scruples against swearing or taking an oath. Declaration in lieu of an oath or affirmation is becoming very general throughout the United States. (3) The statement made by a prisoner, on being arrested on suspicion of a crime, which is taken down in writing.

Declaration, Dying. The rule that secondary or hearsay evidence is inadmissible suffers an exception, in law, in the case of a declaration made by a person convinced of his impending death, and who may not survive the trial of the accused. In Scotland, the dying declaration of a witness is admissible even though he is not himself conscious of the danger of death, and in the United States a declaration is frequently admitted, both in civil and in criminal cases, as primary evidence, without regard to the immediate apprehensions of death. The principle under which the dying declaration is admitted is that the awful situation of the dying person is as powerful over his conscience as the obligation of an oath, and does away with all motive to disguise the truth. Accordingly the person against whom a dying declaration is put

in evidence may be allowed to show that the deceased was not of such a character as to feel the religious obligation of his situation. A dying declaration may be adduced for as well as against a person accused of crime; and there are cases on record in which persons charged with murder have been successfully exculpated on this kind of evidence.

Declaration of Independence, UNITED STATES. The steps by which the extra-legal *de facto* governments of the colonies during the early Revolution—the committees of correspondence and safety—were turned into formal legislative bodies, are detailed under CONSTITUTIONS, STATE, and CONGRESS, CONTINENTAL. But only a few persons, chiefly in the North, at first contemplated separation from the mother country. That they could have expected to conclude a victorious war by land and sea on any other terms, or to dissolve a successful common government and return to disintegrated nullity, seems so incredible that a certain section of historical scholars set down their professions of loyalty to sheer hypocritical falsehood. The history of sincere attempts at "conciliation" up to and far into the Civil War is sufficient answer to this charge. A still better answer is, that the alleged facts are misstated. The difficulty rises from a failure to notice the synchronism of events and views: opinions changed as circumstances changed. The war began in New England, and there it was readily seen to involve independence; the southern colonies thought the difficulty not beyond accommodation till the war was shifted to their own territory in the spring and summer of 1776, when they promptly came over; and the middle colonies, which the war did not touch till after the Declaration, fought it almost to the last. No coincidences are more striking than that the attack on Fort Moultrie was on 28 June 1776, and the South Carolina delegates changed their votes from no to yes 1 July; and that while the New York delegates refused to vote on the Declaration for lack of authority, it was ratified by a New York convention a week after Howe's arrival at Staten Island, 30 June.

The first Congress, of 1774, assumed neither executive nor legislative authority. The second, early in its existence (6 July 1775), formally disclaimed any purpose of separation. The first half-unconscious step was the appointment, November 1775, of five commissioners to maintain communications with friends of the colonies in "Great Britain, Ireland, or elsewhere": only independent countries send ministers. Thomas Paine's 'Common Sense,' urging independence as inevitable, and the sooner the better, appeared 9 Jan. 1776; it had wide influence, and unlocked many tongues. So general was the concurrence with Paine's views that in fear of them, three of the middle colonies—New Jersey, Pennsylvania, and Maryland—instructed their delegates to vote against any such measure; the other two, New York and Delaware, were bitterly divided, and their delegates took no part in forwarding the independent movement; South Carolina was also hostile, contrary to its usual habit of eager initiative—probably from fear of England stirring up the great Indian confederations against the South, as was afterward done. But events pushed them on. British naval captures led Congress,

FROM THE PAINTING BY TRUMBULL.

SIGNING OF THE DECLARATION OF INDEPENDENCE.

DECLARATION OF INDEPENDENCE

23 March, to declare all British vessels lawful prize; and on 6 April it opened all United States ports to all vessels other than British. This was an act of absolute sovereignty, acknowledged or not. The colonies, under instructions from Congress, were steadily forming State governments (see CONSTITUTIONS, STATE); and Congress 10 and 15 May recommended all the remaining ones to take the same step, which of course involved making their common Union independent also. John Adams was the foremost agent in all this work. The North Carolina convention 22 April resolved to "concur with those in the other colonies in declaring independence." On 17 May Virginia instructed her delegates in Congress to move a "Declaration of Independence"; and on 7 June Richard Henry Lee made a motion to that effect in Congress, which was seconded by John Adams. On the 8th and 10th this was debated in committee of the whole; but action was postponed to 1 July, as some delegations were averse and others were waiting instructions.

On the 10th a committee of five was appointed to draw up the Declaration: Thomas Jefferson of Virginia, John Adams of Massachusetts, Benjamin Franklin of Pennsylvania, Roger Sherman of Connecticut, and Robert R. Livingston of New York. Its composition was assigned to Jefferson by the committee; the latter and Congress made many changes, but mostly by omission rather than alteration of wording, so that the language is practically all Jefferson's. The chief cancellations were five: (1) and (2) The last two counts of his indictment of the King. (1) That he had "incited treasonable insurrections of our fellow-citizens" by promising them confiscated property. The charge was probably felt to be too weak to maintain, as well as likely to weaken the general case. (2) That he had carried on the slave-trade, and refused to allow American legislatures to suppress it. South Carolina and Georgia, which were actively carrying it on themselves, would not permit this; and too much Northern wealth had been earned by it not to make the North very willing to suppress the passage, which would impress foreign nations unpleasantly as to their sincerity. (3) Superfluous rhetoric about the incredulity of "future ages" as to the daring tyranny of the king. (4) Review of American history, denying that Great Britain had assisted in our establishment, and alleging that "submission to their parliament was no part of our constitution." It was thought best to go as little into the remote origins as possible, fixing the attention upon recent oppressions and natural rights; and above all, to ignore the existence of parliament altogether. That body is not alluded to, except inferentially as the "others" with whom the king has "combined" to subject the colonies to an alien and illegal jurisdiction. This was in pursuance of the steady contention of the colonies. (5) Attacks on the English people for re-electing "the disturbers of our harmony," and allowing their chief magistrate to perpetrate these enormities. This was struck out to avoid giving offense to the friends of the colonies in England, who in fact, by upholding Liberal leaders and even generals, saved us at last.

The Declaration was reported 28 June. On 1 July as fixed, debate was begun afresh on Lee's resolution. New Jersey and Maryland had re-

versed their instructions meantime. In committee of the whole that evening, nine States voted for it; Pennsylvania and South Carolina voted against it (but the latter delegates, possibly after hearing from the South, offered without instructions to vote yes if it would make a unanimous vote), Delaware was divided, and New York, as above stated, refused to vote. The "yea" Delaware delegate, McKean, sent an urgent message to the third, Caesar Rodney, then on a political trip in southern Delaware, to come on at once; Rodney traveled 80 miles the next day, arrived in the evening, and reversed his State's vote. Pennsylvania reversed hers also; and this leaving only the abstaining New York delegates out of the voting, the South Carolina members voted yes. This carried the motion that "these united colonies are and of right ought to be free and independent States, that they are absolved from all allegiance to the British Crown, and that all political connection between them and the state of Great Britain is and ought to be totally dissolved," by 12 yeas and no negative vote. On the 3d the Declaration was taken up, and as amended was passed on the evening of the 4th. The anniversary of the fact of independence is therefore the 2d; that of the adoption of the specific document in which it was proclaimed to the world is the 4th, as celebrated. The usual statement that it was "signed" by the members at this time, however, is incorrect; it was signed by the president and secretary, whose signatures only were borne by the printed copies sent out. The journals of Congress did not enter the Declaration, but left a blank for it, which was afterward filled in and the signatures taken from the engrossed copy. On the 9th the New York convention ratified it, and the delegates gave in their formal adherence on the 15th; it was then, as entitled, "The Unanimous Declaration of the Thirteen United States of America." Six additional Pennsylvania members also recorded a formal vote on the 20th. On 19 July Congress passed a resolution that it should be engrossed on parchment, and on 2 Aug. it was signed by 53 members present; Gerry of Massachusetts, McKean of Delaware, and Thornton of New Hampshire were empowered by their legislatures to sign later, Thornton not signing till 4 Nov.

The parchment with the original signatures was deposited with the Department of State when the government was organized in 1789. In 1823 John Quincy Adams had a copper-plate facsimile made, to give copies to the signers and their heirs; but unfortunately it ruined the original. The wet sheet pressed on the face drew out the ink so that the signatures have become illegible and almost invisible, and the text partially so; and after being shown for many years only on special occasions, in 1894 it was definitely sealed up in a steel case to keep it from light and air. From 1841 to 1877 it was in the Patent Office.

The signers represented the States as follows:
New Hampshire: Josiah Bartlett, William Whipple, Matthew Thornton.

Massachusetts: John Hancock, Samuel Adams, Robert Treat Paine, Elbridge Gerry.

Rhode Island: Stephen Hopkins, William Ellery.

Connecticut: Roger Sherman, Samuel Huntington, William Williams, Oliver Wolcott.

DECLARATION OF INDEPENDENCE

New York: William Floyd, Philip Livingston, Francis Lewis, Lewis Morris.

New Jersey: Richard Stockton, John Witherspoon, Francis Hopkinson, John Hart, Abraham Clark.

Pennsylvania: Robert Morris, Benjamin Rush, Benjamin Franklin, John Morton, George Clymer, James Smith, George Taylor, James Wilson, George Ross.

Delaware: Caesar Rodney, George Reed, Thomas McKean.

Maryland: Samuel Chase, William Paca, Thomas Stone, Charles Carroll of Carrollton.

Virginia: George Wythe, Richard Henry Lee, Thomas Jefferson, Benjamin Harrison, Thomas Nelson, Jun., Francis Lightfoot Lee, Carter Braxton.

North Carolina: William Hooper, Joseph Hewes, John Penn.

South Carolina: Edward Rutledge, Thomas Heyward, Jun., Thomas Lynch, Jun., Arthur Middleton.

Georgia: Button Gwinnett, Lyman Hall, George Walton.

It may be noted that several of these were not members of Congress when the Declaration was passed.

The Declaration, as agreed to, follows:

A DECLARATION

BY THE REPRESENTATIVES OF THE UNITED STATES OF AMERICA IN CONGRESS ASSEMBLED.

When, in the course of human events, it becomes necessary for one people to dissolve the political bands which have connected them with another, and to assume, among the powers of the earth, the separate and equal station to which the laws of nature and of nature's God entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation.

We hold these truths to be self-evident, that all men are created equal; that they are endowed by their Creator with certain unalienable rights; that among these are life, liberty, and the pursuit of happiness. That to secure these rights, governments are instituted among men, deriving their just powers from the consent of the governed; that, whenever any form of government becomes destructive of these ends, it is the right of the people to alter or to abolish it, and to institute a new government, laying its foundation on such principles, and organizing its powers in such form, as to them shall seem most likely to effect their safety and happiness. Prudence, indeed, will dictate that governments long established should not be changed for light and transient causes; and, accordingly, all experience hath shown, that mankind are more disposed to suffer, while evils are sufferable, than to right themselves by abolishing the forms to which they are accustomed. But, when a long train of abuses and usurpations, pursuing invariably the same object, evinces a design to reduce them under absolute despotism, it is their right, it is their duty, to throw off such government, and to provide new guards for their future security. Such has been the patient sufferance of these colonies, and such is now the necessity which constrains them to alter their former systems of government. The history of the present King of Great Britain is a history of repeated injuries and usurpations, all having, in direct object, the establishment of an absolute tyranny over these States. To prove this, let facts be submitted to a candid world:

He has refused to assent to laws the most wholesome and necessary for the public good.

He has forbidden his governors to pass laws of immediate and pressing importance, unless suspended in their operation till his assent should be obtained; and, when so suspended, he has utterly neglected to attend to them.

He has refused to pass other laws for the accommodation of large districts of people, unless those people would relinquish the right of representation in the legislature; a right inestimable to them, and formidable to tyrants only.

He has called together legislative bodies at places unusual, uncomfortable, and distant from the depository of their public records, for the sole purpose of fatiguing them into compliance with his measures.

He has dissolved representative houses repeatedly,

for opposing, with manly firmness, his invasions on the rights of the people.

He has refused, for a long time after such dissolutions, to cause others to be elected; whereby the legislative powers, incapable of annihilation, have returned to the people at large for their exercise; the State remaining, in the meantime, exposed to all the dangers of invasion from without, and convulsions within.

He has endeavored to prevent the population of these States; for that purpose, obstructing the laws for naturalization of foreigners; refusing to pass others to encourage their migration hither, and raising the conditions of new appropriations of lands.

He has obstructed the administration of justice, by refusing his assent to laws for establishing judiciary powers.

He has made judges dependent on his will alone, for the tenure of their offices, and the amount and payment of their salaries.

He has erected a multitude of new offices, and sent hither swarms of officers to harass our people, and eat out their substance.

He has kept among us, in times of peace, standing armies without the consent of our legislatures.

He has affected to render the military independent of, and superior to, the civil power.

He has combined, with others, to subject us to a jurisdiction foreign to our constitution, and unacknowledged by our laws; giving his assent to their acts of pretended legislation:

For quartering large bodies of armed troops among us:

For protecting them by a mock trial from punishment, for any murders which they should commit on the inhabitants of these States:

For cutting off our trade with all parts of the world:

For imposing taxes on us without our consent:

For depriving us, in many cases, of the benefit of trial by jury:

For transporting us beyond seas to be tried for pretended offenses:

For abolishing the free system of English laws in a neighboring province, establishing therein an arbitrary government, and enlarging its boundaries, so as to render it at once an example and fit instrument for introducing the same absolute rule into these colonies:

For taking away our charters, abolishing our most valuable laws, and altering, fundamentally, the powers of our governments:

For suspending our own legislatures, and declaring themselves invested with power to legislate for us in all cases whatsoever:

He has abdicated government here, by declaring us out of his protection, and waging war against us.

He has plundered our seas, ravaged our coasts, burnt our towns, and destroyed the lives of our people.

He is, at this time, transporting large armies of foreign mercenaries to complete the works of death, desolation, and tyranny, already begun, with circumstances of cruelty and perfidy scarcely paralleled in the most barbarous ages, and totally unworthy the head of a civilized nation.

He has constrained our fellow-citizens, taken captive on the high seas, to bear arms against their country, to become the executioners of their friends and brethren, or to fall themselves by their hands.

He has excited domestic insurrections amongst us, and has endeavored to bring on the inhabitants of our frontiers, the merciless Indian savages, whose known rule of warfare is an undistinguished destruction of all ages, sexes, and conditions.

In every stage of these oppressions we have petitioned for redress in the most humble terms; our repeated petitions have been answered only by repeated injury. A prince, whose character is thus marked by every act which may define a tyrant, is unfit to be the ruler of a free people.

Nor have we been wanting in attention to our British brethren. We have warned them, from time to time, of attempts made by their legislature to extend an unwarrantable jurisdiction over us. We have reminded them of the circumstances of our emigration and settlement here. We have appealed to their native justice and magnanimity, and we have conjured them, by the ties of our common kindred, to disavow these usurpations, which would inevitably interrupt our connections and correspondence. They, too, have been deaf to the voice of justice and consanguinity. We must, therefore, acquiesce in the necessity which denounces our separation, and hold them, as we hold the rest of mankind, enemies in war—in peace, friends.

We, therefore, the representatives of the United States of America, in General Congress assembled, appealing to the Supreme Judge of the World for the rectitude of our intentions, do, in the name and by the authority of the good people of these colonies, solemnly publish and declare, That these United Colo-

DECLARATION OF INDULGENCES — DECLARATION OF PARIS

nies are, and of right ought to be, Free and Independent States; that they are absolved from all allegiance to the British crown, and that all political connection between them and the State of Great Britain is, and ought to be, totally dissolved; and that as free and independent States, they have full power to levy war, conclude peace, contract alliances, establish commerce, and to do all other acts and things which independent States may of right do. And for the support of this declaration, with a firm reliance on the protection of Divine Providence, we mutually pledge to each other, our lives, our fortunes, and our sacred honor.

Howell, 'State Trials'; Burnet, 'History of James II.'; Fox, 'Reign of James II.'

Declaration of Paris, 1856. Between the Napoleonic wars and the Crimean war, industrialism in European societies had made great advances over militancy; and the interests of peaceful trade, for the first time in history, were felt even by the most powerful nations to be more important than those of destruction. Declaration of Indulgences, a name applied to the declaration or proclamation issued by Charles II. (1672), and also to a proclamation of James II. (1687), which were virtually acts granting liberty of conscience to all whose rights to their own methods of worship had been curtailed by the Conventicle and Five Mile Acts. These royal acts and declarations of Charles and James suspended the enforcement of the penal status which had been made against the Roman Catholics and Nonconformists, and removed the test of qualification for the holding of civil or ecclesiastical office. James II. ordered the declaration to be read in the churches, 25 April 1688. The primate and six bishops of the Church of England protested against the order, saying it was intended to benefit the Roman Catholics and that it was illegal. The king declared their act seditious libel against the crown, and sent the offenders to the Tower. Later they were tried and acquitted, 30 June 1688. On the day of their release an invitation was sent to William of Orange to come and save England from the Roman Catholics. The signers of this invitation, who wished the downfall of James II., were the Earls of Danby, Devonshire, and Shrewsbury, and the bishop of London and other bishops. (See TEST ACT.) Consult:

opening that war, therefore, the allies — England, France, and Italy — announced their intention to respect the goods of neutrals on the sea as never before; to spare from capture either neutral goods on enemies' ships or enemies' goods on neutral ships, excepting contraband; and not to issue letters of marque for privateering. After the war, at the Congress of Paris, 16 April 1856, the contracting powers publicly declared that the unsettled condition of maritime law bred disputes and conflicts, and that a uniform policy should be established; wherefore they adopted the following "solemn declaration," to bind whoever acceded to it, but exclude either from its obligations or its privileges those who did not: (1) "Privateering is and remains abolished"; (2) "The neutral flag covers enemy's goods, with the exception of contraband of war"; (3) "Neutral goods, with the exception of contraband of war, are not liable to capture under an enemy's flag"; (4) "Blockades, in order to be binding, must be effective — that is to say, maintained by a force sufficient really to prevent access to the coast." This was signed by the delegates from Great Britain, France, Austria, Prussia, Sardinia, Russia, and Turkey; all other civilized maritime nations acceded except Spain, Mexico, most of the South American

DECLARATION OF RIGHTS — DECLENSION

states, and the United States, which refused on account of their small navies, making a resort to privateering imperative in case of war. This country, however, through its secretary of state, Wm. L. Marcy, offered to accede on condition of what was known as the "Marcy Amendment," to exempt all private property from capture on the seas; privateering would thus become objectless and cease. This was declined, and United States goods remained at the mercy of any two powers at war. On the outbreak of the Civil War, Great Britain and France recognized the Confederacy as a belligerent, and the latter at once issued letters of marque; Mr. Seward for the United States, requested permission to subscribe to the Declaration; but the former powers would only agree on condition of its not invalidating the Confederate rights. Nothing further was ever done about it; but in 1898 the United States and Spain, both outside the Declaration, proclaimed their intention to respect it. Sections 2 to 4 are recognized international law; and as privateers are now replaced by fast cruisers in strong navies, privateering is practically though not formally obsolete.

Declaration of Rights. The Stamp Act Congress (q.v.) of 1765 published a "Declaration of Rights and Grievances of the Colonists of America," protesting against the Stamp Act, and any other effort to tax the colonists while denying them representation in the Parliament which imposed the taxes. They sent a petition to the king, and another to Parliament, claiming the same rights as were enjoyed by Englishmen born within the British Isles. The right of representation was included in these; but instead of petitioning for that right, they declared its obvious impossibility a reason why they should not be subject to taxation. The Continental Congress of 1774 (see CONGRESS, CONTINENTAL) asserted a similar claim in its declaration, as a preliminary to calling a final congress, and the Declaration of Independence begins a like assertion. The assertion of such claims was considered so vital in written constitutions by men of that age, that the strongest objection to our national one was its omission in this particular, and the storm of amendments pushed forward (see *Amendments, History of the*, under CONSTITUTION) consisted mainly of bills of rights.

Declaration of War, a public proclamation by one government in which it declares itself to be at war with another. The use of the telegraph nowadays and the wide diffusion of news, by which every incident in the events which lead to a war are instantly published, make such a formal declaration scarcely necessary, and each belligerent is usually satisfied with announcing its warlike intentions to its own subjects and to neutrals. In the United States Congress alone has the power to declare war, and when that body votes for war with a foreign power such a measure is considered tantamount to a declaration of war.

Declar'atory Act, an act passed by the English Parliament 7 March 1766, accompanying the repeal of the Stamp Act, asserting the constitutional right of the king, with the advice of Parliament, to bind the colonies by its laws and action "in all cases whatsoever." This is English colonial law still; but no attempt has since been made to enforce it against the

wishes of the colonies, except where the rights of British subjects have been infringed.

Décle, dā-kl, Lionel, English explorer and author: b. Rocourt, St. Quentin, France, 16 May 1859. He is of French parentage but is a naturalized Englishman. He has traveled extensively in Asia, Africa, and America, was on the staff of the *Pall Mall Gazette* for several years and commanded the *Daily Telegraph* expedition from the Cape to Cairo (1899-1900). He has published: 'Three Years in Savage Africa'; 'Trooper 3809,' an account of his personal experience in the French army.

Declension, the change of termination in certain classes of words, in various languages, to indicate the relation in which those words stand toward other words in a sentence. The condition of change to which the words are brought by the several terminations, are styled cases (Lat. *casus*) or fallings, the ancient Latin grammarians representing the nominative as the *casus reclus*, or upright, perpendicular case, while the rest sloped gradually down at various angles, until the ablative was a horizontal line, set at right angles with the nominative. The words subject to declension are of the classes, noun, adjective, pronoun, article. In the Latin language grammarians generally recognize five declensions, five different modes of forming cases, and to each declinable word they assign five cases namely the nominative, genitive (or possessive), dative, accusative (or objective), vocative (or interjectional), and ablative. There is also a locative case, used in the names of cities, and in such forms as *humi*, *domi*. Example, nominative *hortus*, garden; genitive, *horti sepes*, the garden's hedge; dative, *horto additum*, added to the garden; accusative, *hortum colo*, I cultivate the garden; vocative, *o hortie*, O! garden; ablative, *horto disjuncta adificia*, buildings separated by a garden. This word *hortus* belongs to the second declension: the first declension has the same five cases, for example, *ala* (wing), genitive, *alae*, dative, the same, accusative *alam*, vocative *ala*, ablative, the same save in prosodical quantity, *alā*. An example of the third declension would be *ales* (bird, winged) *alitis*, *aliti*, *alitem*, *ales*, *alite*; of the fourth declension *usus* (use), *usus*, *usui*, *usum*, *usus*, *usu*; of the fifth, *fides* (faith, trust) *fidei*, *fidei*, *fidem*, *fides*, *fide*. The examples show the process of declension in the singular number: for the plural number let one example suffice; the plural cases of *servus* (slave), are *servi*, *servorum*, *servis*, *servos*, *servi*, *servis*: in the plural the nominative and vocative are always of the same form; so, too, are the dative and ablative. The Greek declensions are variously classified, but most generally made three in number and the cases five, as well as two dialectic locative cases. The ancient Sanskrit language has eight cases of nouns and the present language of the Finns has 15: but the languages of western Europe derived from Latin—Italian, Spanish, Portuguese, French, etc.—have dropped the declinational terminations of the Latin, and hence the Latin for "man," which is declined *homo*, *hominis*, *homini*, *hominem*, *homo*, *homine*, has in those modern languages the one form *homme* in French, *uomo* in Italian, *hombre* in Spanish. The ancient Germanic language, from which English is descended, had declensions; but in our language the only remnants of the an-

cient forms are, the possessive case of nouns and the objective case of pronouns, I, me; he, him; she, her; they, them. While in the Indo-European languages above cited, as well as in the Semitic tongues, the unity of the word is not destroyed by inflection, in languages like the Turkish, which are styled agglutinative, elements are added in declension which supersede or obscure the individuality of the original word.

Declination, in astronomy, the distance of a heavenly body from the celestial equator (equinoctial), measured on a great circle passing through the pole and also through the body. It is said to be north or south according as the body is north or south of the equator. Great circles passing through the poles, and cutting the equator at right angles, are called circles of declination. Twenty-four circles of declination, dividing the equator into 24 arcs of 15° each, are called hour circles or horary circles.

Declination, Magnetic. See MAGNETISM, TERRESTRIAL.

Declination Needle, or Declinometer. The magnetic meridian passing through any place on the earth's surface is a vertical plane whose direction is that in which a magnetic needle, free to move about a vertical axis, comes to rest under the influence of the earth's magnetic force. In general, the magnetic and geographical (or astronomical) meridians are not coincident; the angle between is termed the magnetic declination, or (in nautical phraseology) the variation. It is east or west, according as the magnetic is east or west of the geographical meridian. Any apparatus for the measurement of this angle is termed a declinometer, and consists essentially of a means of ascertaining the two necessary elements—namely, the directions, at the place of observation, of the two meridians. Permanently fixed instruments of this nature are set up in all magnetic observatories. They are generally self-registering, and record the slightest hourly, diurnal and annual variations in the declination of the magnetic needle, as well as the more violent changes due to magnetic storms.

Decline and Fall of the Roman Empire, The, a monumental work by Edward Gibbon, the first volume of which appeared in 1776, and the last in 1788. 'The Decline and Fall' has been pronounced by many the greatest achievement of human thought and erudition in the department of history. It is a history of the civilized world for 13 centuries, during which paganism was breaking down, and Christianity was superseding it; and so bridges over the chasm between the Old World and the new. It is marked by dignity of style and picturesqueness of narration. The great criticism of the work has always been upon the point of Gibbon's estimate of the nature and influence of Christianity.

Decoction, in pharmacy, a solution of a vegetable principle largely obtained by boiling in water the substance containing the principle. Inasmuch as plant drugs usually yield their constituents more readily to hot water than they do to cold water, decoctions are preferred to infusions for obtaining the active principles of plants. Decoctions are not very much used at the present time, because of their great complexity, the active principles of plants being obtained by other means.

Deco'ic Acid, or Capric Acid, an organic acid having the formula $C_{10}H_{20}O_2$, and occurring in the form of various compounds in butter, cocoanut oil, fusel oil (from certain sources), Limburg cheese, and the fatty matters extracted from the wool of sheep. It is soluble in alcohol and ether, but almost insoluble in cold water. It crystallizes in needles that have a faint odor suggestive of rancid butter, and is prepared by the distillation of oleic acid, or by the oxidation of that acid by nitric acid. The name "capric" has reference to the fancied resemblance of the odor to that of a goat; while "decoic" refers to the 10-carbon atoms that the acid contains.

Decomposition, Chemical, is the separation of the constituents of a body from one another, these constituents being obtained either free or in a new state of combination. Limestone, for example, is decomposed into lime and carbonic acid, oxide of mercury into mercury and oxygen, by heat. This is called simple decomposition. Definite organic bodies resemble inorganic in being influenced by similar forces, but the result in their case is somewhat different, arising from their different composition. In the case of an organic body it is possible to convert its constituents at once into their simplest states of combination, but it is also possible to obtain a large number of intermediate compounds by regulating the decomposing action. The process by which such bodies are thus decomposed is styled by chemists compound decomposition.

De Coninck, Pierre Louis Joseph, pē-ār loo-ē zhō zēf dē kō-nānk, French genre painter: b. Meteran, Nord, 22 Nov. 1828. He was a pupil of Leon Cogniet, and won the second prize of Rome in 1855, taking medals in 1866 and 1868 and a third class medal in 1873. Among his works are: 'Eva and Uncle Tom' (1857); 'Woman Bathing at Capri' (1863); 'Torture of Queen Brunhau' (1864); 'Ballet Girl Resting' (1864); 'Christ Blessing Little Children' (1865); 'Two Friends' (1866); 'Lavandara' (1867); 'The Ordeal' (1869); 'Little Charmer' (1870); 'The Ring' (1873); 'Kittens' (1874); 'Pastorella'; 'Hare in Trap' (1881); 'The Trappist.'

Decorah, dē-kō'ra, Iowa, city, county-seat of Winneshiek County; situated near the northeastern corner of the State on the Iowa River, about 30 miles from its mouth, and on the Chicago, Milwaukee & St. Paul Railroad. The city has manufactures of paper, flour, and agricultural machinery. The water-plant is owned by the city. A Norwegian Lutheran College and the Breckenridge Institute are located here. Pop. (1900) 3,246.

Decorated Style, the second style of pointed (Gothic) architecture, in use in Great Britain from the end of the 13th to the beginning of the 15th century, when it passed into the Perpendicular. It is distinguished from the Early English, from which it was developed, by the more flowing or wavy lines of its tracery, especially of its windows, by the more graceful combinations of its foliage, by the greater richness of the decorations of the capitals of its columns, and of the moldings of its doorways and niches, finials, etc., and generally by a style of ornamentation more profuse and naturalistic, though perhaps somewhat florid. The most dis-

DECORATION DAY—DECORATION

tinctive ornament of the style is the ball-flower, which is usually inserted in a hollow molding. The Decorated style has been divided into two periods, namely, Early or Geometrical Decorated period, in which geometrical figures are largely introduced in the ornamentation; and the Decorated style proper, in which the peculiar characteristics of the style are exhibited. To this latter period belong some of the finest monuments of British architecture. See ARCHITECTURE.

Decoration Day, a legal holiday in all the States except Idaho, for decorating the graves of soldiers killed in the Civil War, whether in national or private cemeteries. The custom of "Memorial Day" (as it is otherwise called) originated with the Southern States, and was copied scatteringly and on different days in some Northern States,—all in the spring, for natural reasons. On 5 May 1868 Gen. John A. Logan, then commander-in-chief of the Grand Army of the Republic, issued an order appointing 30 May of that year for Grand Army services in so decorating graves—choosing that day possibly as being the date of discharge of the last Union volunteer of the War. Since then all the States have adopted it singly, there being no national law on the subject.

Decoration, Interior, in the United States. During the last quarter of the 19th century much attention was excited in the Atlantic coast cities by the attempts, which began to be seen and heard of, at rich decoration of houses and churches. There had been, before that time, little of consequence; the plastered adornments of the old colonial houses still existed, and these were sometimes copied, clumsily or otherwise; and there were a few public buildings in which an historical painting or two was put up; but decoration in a larger sense had hardly been undertaken.

Five years after the close of the Civil War some architects in New York and Boston began to try to increase their own charge of the dwelling-house in hand by making careful original designs for interior woodwork, with stairs and fixed sideboards and chimney-pieces, and even in the way of wall-painting of decorative character. All this work could be done from drawings made in the architect's office, always supposing that he had surrounded himself with draughtsmen of good capacity in other than merely mechanical drawing. Thus, excellent wood-carving, in solid oak plank or in delicate panels of holly or mahogany was carried out even to the adornment in a very complete fashion of large staircases and entrance-halls. The painting, too, though limited to scrolls and floriated work, was in the way of considerable artistic development and promised well. The exhibition at Philadelphia in 1876 increased the interest in these with all the other decorative arts, by spreading further West and South the knowledge of their existence and of the possibilities connected with them. The result of this was seen in the establishment of studios, and also of more commercial establishments intended for the making and application of interior decorations of all sorts—from costly mural paintings and brilliant stained glass down to the simplest carved and molded mantelpieces and dadoes. The difference between the two classes of establishments should be made clear, for the establishment

devoted to interior decoration, like that devoted to upholstery and the making of furniture is of necessity commercial in its aims, and will, as a general thing, sell to the buyer what he demands except in so far as the persuasions of the salesman or superintendent can lead him to adopt another view than that which he held originally. The atelier or studio, on the other hand, is the workshop of an artist who, in his capacity as artist, undertakes to give nothing which he does not approve. Although some of the more commercial establishments are directly controlled by able and conscientious artists, the distinction stated above is still to be maintained, and the test is that such a studio as described above will offer nothing for sale, will have nothing that could be sold, will undertake a piece of decoration under the usual limitations and with the usual desire to please the owner of the house, but also limited by the artists' conditions as to what is right.

The establishment of these workshops of different kinds very soon put out of their course the few architects who had desired to undertake such work themselves. When a painter or sculptor would undertake the richer decorations of certain parts of the house, it was natural to leave the less elaborate ones also to him. Only a few of the offices of architects will now undertake decorative work beyond the very simple full-size drawings made for plaster ceilings and molded door-trims. Another influence, also, has appeared—the clever and energetic work done by the larger upholsterers in the great cities, some of whom undertake decoration on a large scale. The student of such things should not lose sight, however, of the essential distinction between work which is done in the commercial way with the single purpose of pleasing the buyer, and that which is done in the artist's way with the primary purpose of being as good as possible within the limits set by the buyer.

The larger and more monumental paintings of which there is so much to be told, began with the decorations by John LaFarge of Trinity Church in Boston, and the paintings by William Morris Hunt in the Capitol, or State House, in Albany, N. Y. These are nearly contemporaneous. Trinity Church having been recently built by H. H. Richardson, LaFarge was set to work in 1876, having several assistants, since well known as decorative painters on their own account. The interior of the church is filled with paintings, chiefly of figure subjects, of which subjects the best known are 'Christ and the Woman of Samaria,' and 'Christ and Nicodemus.' The work of the whole decoration is chiefly a matter of warm color. Mr. Hunt's paintings in the capitol were singularly unfortunate, for, having been painted on the wall directly, they were soon injured by the unequal settlement of the building and then were concealed entirely by the changes which had to be made. They were finished at the beginning of 1879 and in 10 years from that time were lost to sight forever. Their subjects were emblematic and metaphorical in a large way, 'The Flight of Night' and 'The Discoverer.' The purpose of Hunt in painting his decorations directly upon the wall deserves all honor, and it is greatly to be wished that those who have followed him in producing the important mural paintings of America would have followed the same rule. The process of *marouflage*, by which

DECORATION

the artist paints upon a great canvas which is afterwards pasted upon the wall, has many advantages; but it should certainly be arranged so that the work on this canvas should be done in the room to be adorned by it, and in the light and with the surroundings which are to be its permanent conditions.

The Albany capitol had been put into the hands of an artistic commission consisting of Leopold Eidlitz, H. H. Richardson, and Frederick Law Olmsted. This was done about 1874, and after a short interval of time the work still needing to be done upon the building was divided between the two architects, Mr. Eidlitz taking the north side on Washington Avenue, with the assembly chamber and its accessories, and Mr. Richardson the south side, with the senate chamber. The interior decorations were very different in character each from the other, but each was carried out in a very elaborate fashion without much reference to the original design of the building, which, indeed, was almost entirely changed in character from the third or principal story upward. Richardson's decorations were extended afterwards to include the great staircase at the western end of the building, the elaborate hall and annexed chambers of the Court of Appeals and the State Library. Great originality was shown in these; the wood-work of the galleries, the screens and dwarf partitions, the tribunes and desks for presiding officers and judges, the great chimneypieces and the ceilings were treated with extraordinary vigor and intelligence, and they remain among the most instructive work of independent thinking in design that has been done in America. With the aid of certain sculptors who devoted themselves to this decorative work, among whom should be named John Francis Brines, the elaborate stone-built staircases received an architectural decoration closely akin to that of the porches of entrance: elaborate leafage of the Byzantine type, especially invented and developed for the occasion, was combined with heads (either portraits or ideal portraits) of prominent natives of New York, and ideal heads were introduced in other parts of the work. There was no mural painting done in the capitol other than the pictures by Hunt, mentioned above, nor was there any stained glass used there.

About 1878 John LaFarge contracted with Cornelius Vanderbilt for a carved ceiling in Mr. Vanderbilt's house in New York; the smaller house which was the nucleus of the vast palace that now stands at Fifth Avenue and 57th Street. This ceiling was then carried out in the richest possible way. There was much decoration in relief, ideal figures, and the panels containing them framed and enclosed by molded and carved beams and cross beams so that each panel was treated nearly like a caisson. But the peculiarity of this was that the reliefs were all in polychromy and that very rich materials were used to produce the color effect desired. Glass, in masses (colored and cast for the purpose), bronze (and that of many tones and shades), marble, ivory (sometimes stained), mother-of-pearl and even silver were used in these extraordinary decorations. The same room contained a mantelpiece with a high structure above it of pilasters carrying a special entablature, and all this was inlaid with mother-of-pearl in a very brilliant way. The designs were singularly free from the modern American fault of following

old styles, even to the extent of copying too closely special examples of these styles. It would be impossible to say that any ancient style suggested the treatment adopted.

By 1880 it had become rather common for architects, when employed to build the very costly houses of the new-made millionaires, to recommend to their employers the sculptors and mural painters who could fill these private palaces with decorative art of the highest class. The Villard house in New York, afterward belonging to Whitelaw Reid, was one of the earliest of these, and this contains what are perhaps the finest mural paintings that LaFarge has done: the two lunettes, 'Music' and 'The Dance'; but very soon this was rivalled by houses built in the same city and in Boston and Chicago. George B. Post of New York has been especially successful in obtaining for the finer adornment of his buildings the work of the best men in both the great arts of expression. He was the architect of the Cornelius Vanderbilt house in its former and in its later and much enlarged form, and also of the house of Collis P. Huntington, and had charge of the decorative re-arrangement of the Lawyers' Club in New York and of banking houses in different parts of the country.

There was another singular manifestation of the disposition to adorn buildings of residence, for the great hotels began to find it necessary to pay for costly pictures to adorn their reading and lounging rooms, their dining-rooms and smoking-rooms, and the like. Mr. Hardenberg's hotels showed this tendency among the earliest, for in the Waldorf there is a really splendid ceiling by Will H. Low, representing 'The Triumph of Venus,' and many lunettes and smaller wall-paintings. In the Astoria, adjoining the Waldorf, there are other similar decorations. In the Manhattan there is a long and broad frieze of painting by Charles Y. Turner, representing 'The Triumph of Manhattan,' and in the café a landscape decoration by Frederick Crowninshield, running all around the large room and showing above the high dado of light-colored wood. This last named achievement is a wonderful success in that while the solidity of the wall is not destroyed by the treatment, there is still a far-away look of the Roman campagna with the distant mountains, while in the foreground life-size figures seem to look over the solid wall formed by the wooden dado. Mr. Crowninshield has carried out and enlarged the same style of decoration in his paintings of a certain restaurant at the top of a large department store on 6th Avenue, New York, and this is the most remarkable instance that we can name of the willing acceptance of so elaborate and so purely artistic a decoration in a building devoted to purely commercial purposes.

Decoration other than painting and other than sculpture of human figures has been used in the "office buildings," or great structures built in the business quarters of the cities and rented out in separate rooms or suites of rooms to lawyers, brokers, agents and business men of all sorts, other than the keepers of shops and stores. These buildings since 1875 have been high, fitted with elevators, and solidly built, and since 1885 have been commonly constructed on the "steel cage" principle, which allows of buildings of any height and of rapid construction. This has been the era of the "sky-scrapers,"

DECORATION

which range from 16 to 24 stories, and require a great number of elevators in proportion to their size. A great deal of elaborate work in the way of marble linings, floors of mosaic, of gray and white and black tesserae, and, unfortunately for safety, highly wrought woodwork in the way of door-trims and window-trims and mantelpieces have been used. There has been some slight attempt to carry out decorative designs in stucco and similar varieties of what may be called in a general sense, plastering. This art has, of course, indefinite possibilities, and there is hope that another generation of artists will see in marble the material for the lining of walls near the foot and where they are most exposed to injuries, while above a certain line the easy method of modelling bas-reliefs in cement or stucco and then painting them in polychromy will be followed.

The Chicago World's Fair, held in 1893, gave much employment to the mural painters and to the sculptors of America during the three or four years preceding its opening. These decorations must not detain us here, because they all vanished with the occasion. It is, in a way, a pitiful thing that the very important paintings of the cupolas and lunettes of those buildings disappeared within a year from the time of their completion.

There are certain public buildings in which it will surprise the student to find very splendid and interesting work, especially in mural painting, where he would certainly look for no such adornment. Thus the Criminal Court-House in Centre Street, New York, has received certain mural paintings by Edward Simmons, ordered and paid for by the Municipal Art Society, and these pictures consist of a central composition of 'Justice,' and two side pictures arranged like a frieze, 'The Fates,' and 'Liberty, Equality and Fraternity.' These pictures are peculiar in being nearly monochromatic, so planned, no doubt, because of the necessity of matching their tones and values with the surrounding white walls—for it was hardly hoped that the whole room could be enriched with color. On the other hand, the building on Madison Square, New York, appropriated to the State Supreme Court, Appellate Division, has its principal rooms and its hall of entrance adorned according to an elaborate general scheme, involving much variety of coloration and many large and fully realized paintings. These are by E. H. Blashfield, Henry Oliver Walker, Kenyon Cox, and many others. This building is also adorned as to its exterior with elaborate sculpture, statues, and high reliefs.

About 1880 was finished the remarkable painting which fills the eastern wall of the Church of the Ascension in New York city. This is the largest mural painting by LaFarge and one of the largest in America. Its subject is that from which the church is named, and the ascending Saviour is accompanied by a glory of angels, while a crowd of disciples watch from the earth below. The value of the picture is in its delicate and melting color, and the fact that this richness of hue and tone has in no way injured the wall as a part of the building. The picture does not count as a break in the solid structure, or as a window through which is seen the external world. The same artist painted in the Church of the Incarnation, the Church of Saint Thomas, and the Church of the Paulist

Fathers, all in New York city. Robert Reid, of New York, has painted in the Church of the Paulist Fathers and in the Church of the Incarnation. At Bowdoin College, in Maine, the elegant little building occupied by the Walker Art Gallery has been decorated by certain paintings, of which those by Vedder and LaFarge are peculiarly important. Some very recent dwelling houses have received splendid mural decorations, among others two at least which have admirable ceilings by Will H. Low. One of these ceilings, in a round drawing-room at a corner of Fifth Avenue, is occupied by a circular picture, of which the subject, put into the title 'Golden Autumn,' is in reality a group of three draped female figures engaged in gleanings from the field and winnowing in the simple old-fashioned way with a sieve.

About 1895 the Congressional Library in Washington was nearly completed, and was then put into the hands of Edward Pearce Casey, of New York, in order that he might administer the elaborate decorations proposed. This building was then adorned with mural paintings by a score of able men, and also by sculptures in the halls and stairs, in this last respect being almost alone in American public buildings. It may be noted here that sculpture has not been employed very freely in interior decoration in America. The great chimney-pieces of hall and library have been adorned with figures, even of life size; and the churches contain many tombs and memorial slabs to which relief sculpture adds a charm, but there is little more. The architect in charge of the Library was fortunately ready to improve his opportunities. The sculptures of Philip Martiny, carried out in a purely decorative way in the lower halls and the great stairs, are singularly appropriate to their place. They include bronze newel statues carrying torches which are fitted with electric lights, and long stretches of parapets very delicately carved with cupids and flowers. The sculptures of the late Olin H. Warner are few, but they are of singular importance, especially a pair of figures in high relief filling the spandrels of the archway leading to the great reading-room—figures of a young and an older student. Herbert Adams furnished a series of figures of about half life size carrying torches. But of all the sculptures of the interior by far the most important are the really surprising statues in the great reading-room, which forms a wide and lofty octagon. Here there are eight colossal symbolic statues worked into the architecture of the room—adorning the abutments of the great vaults—and these are by first-rate men, J. Q. A. Ward, Daniel C. French, Paul W. Bartlett, John Flanagan, and others. On the railing of the high tribunes forming a kind of second story to each recessed side of the octagon are ideal portrait statues of heroic size cast in bronze, and these, though placed too high for the best examination from below, and too distant from him who ascends the high tribune and looks across the rotunda, are still of such remarkable importance that they deserve minute study. Herodotus is by Daniel C. French; Bacon is by John J. Boyle; Patrick Henry is by Herbert Adams; Beethoven is by Theodore Baur; Fulton is by Edw. C. Potter; Shakespeare is by Frederick MacMonnies; Chancellor Kent is by George E. Bissell; Gibbon, the historian, is by Charles H. Niehaus; Michelan-

DECORATIONS — DECORATIVE PLANTS

gelo is by Paul W. Bartlett. These 16 statues are, then, of singular interest, and casts and photographs of them should be within reach of everyone. The painting of this large building has been carried out with the most elaborate care, and it has been helped by mosaics of ceilings and vaults, as well as of floors. On the ground floor there are long corridors which go off to the north and south, with their ceilings vaulted in cupolas and pendentives; and the entrance hall itself, from which these corridors start, is divided by piers into a northern, a southern, and a western vestibule, each vaulted, with the vaults adorned in mosaic and the lunettes painted by Charles Sprague Pearce and H. O. Walker. Elihu Vedder has a special apartment behind the stair and leading to the great reading-room, a lobby, which he has filled with allegorical paintings of Good Government, Bad Government, Anarchy, etc.; and near this a great wall mosaic, 'Minerva, the Protectress of Civilization.' Edward Simmons has one of the long corridors, in which he has filled 20 lunettes. The eye of the dome which crowns the great rotunda of the reading-room has a broad band carried around it filled with admirable symbolical figures by E. H. Blashfield. It is impossible to continue the examination of this vast collection of mural paintings, for this whole article might be devoted to it. A certain amount of blame has been thrown upon the building for its vividness of color, the constant play and change of contrasting effects; but it is the experience of every student of art who has given time to this strange gallery of art that its worth grows upon the student continually.

The public library of the city of Boston is alone in America in having a great mural painting by Puvis de Chavannes, the chief of modern decorative artists in color. And yet coloration is not the chief object of Puvis, whose work is too severely restrained by architectural considerations — is too honestly and frankly subordinated to the necessities of wall decoration, to be brilliant in color. What was said above about LaFarge's pictures in the Church of the Ascension is to be taken in singular contrast to what is said here about the great painting at the head of the stair in the Boston public library, for here warmth and brilliancy of color are eschewed, and the exquisite result bears out the great Frenchman in his choice of method. There are smaller panels by the same artist on the other walls of the staircase halls. The large room devoted to the giving out of books, in the second story of the library, is painted by Edwin A. Abbey. But here the result has been very different and in no way equally valuable. With the exception of Puvis' picture, the finest thing about the library, and the most important mural painting, probably, in America, is the Sargent at the south end of the hall in the third story, where the great staircase comes to an end. A painting at the north end of the hall was completed about 1895, and this excels in power, in magnificent sweep and force of workmanship, but it cannot compare with the painting at the south end in perfect fitness to the place and to its requirements. That picture at the south end of the room deals with the Christian faith as an established and accepted piece of ecclesiology and is divided into three chief parts, so that the whole wall at the end of the gallery, with no

separation of the lunettes from the square wall below, is filled with the composition, superb in line and in color. The other walls of the same gallery are awaiting their decoration.

Some mural paintings of great importance date from the early years of the 20th century. Edwin H. Blashfield has painted, for the courthouse of Baltimore, a picture 34 feet long and divided into three principal sections, to commemorate the surrender of his commission in the army by George Washington. For the same building Charles Y. Turner painted as a decoration 'The Barter with the Indians for Land in Southern Maryland,' and these two great pictures were completed in the autumn of 1902. Mr. Turner has now in hand another picture for the same courthouse, 'The Burning of the Peggy Stewart at Annapolis in 1774,' this being one of the protests against the tax laws and in all respects equivalent to the famous Tea Party of Boston. For the same building Mr. Blashfield has completed (May 1904) 'The Edict of Toleration of 1649,' Lord Baltimore presenting his people to the personified virtues, Wisdom, Justice, and Mercy. For the Citizens' Bank of Cleveland, Ohio, Mr. Blashfield has completed a painting 27 feet long, symbolical of the uses of wealth. The State Capitol of Minnesota, in the city of Saint Paul, is to contain mural paintings by John LaFarge, Edward Simmons, H. O. Walker, Kenyon Cox, E. H. Blashfield, and Elmer Ellsworth Garnsey. There will also be paintings, framed and hung in the building, by Frank D. Millet and Douglas Volk.

RUSSELL STURGIS,

Decorations. See ORDERS AND DECORATIONS.

Decorative Plants. The plants used for decoration may be said to include not only species cultivated for purely ornamental purposes, but many others which have important uses. Thus the chestnut-tree, which in the forest is valued for its timber, might in a park have a distinct value for its pleasing form, attractive foliage, and long, graceful catkins. Similarly, the apple-tree when in flower can scarcely be rivaled as a lawn specimen. It is attractive also in its general form and when laden with red or yellow fruit. In the same way the common garden asparagus is a particularly ornamental plant, not only in itself, but to conceal the unsightly stems of such tall-growing plants as hollyhocks, or to act as the background for such brilliant flowering plants as scarlet sage (*Salvia splendens*). Even some of the weeds can be made to do signal decorative duty, as when a large-leaved dock is used to give tone to a group of otherwise characterless foliage, or when a mullin is allowed to rear its flowering stem like an exclamation point in a similar group. Thus it is evident that there is no fast line of demarkation between decorative and useful plants and kation between decorative and useful plants and useless plants, since the purpose for which the specimen is grown determines whether it is decorative or not.

But setting aside such utilitarian cases as forest and fruit trees, shrubs, vegetables, and weeds which may occasionally serve as ornamental subjects, decorative plants may be variously classified as to their place of growth, whether out of doors or under glass; as to their character of growth, whether trees, shrubs, vines, or herbs, etc.; as to their duration.

whether annual, biennial, perennial, etc.; as to their attractive parts, foliage, flowers, fruit, bark, etc.; as to their season of special attractiveness; and in many other ways. For present discussion, however, the place where the plants are utilized and the kind of plants will be considered.

Unquestionably, trees constitute the most important group, since apart from any specially attractive individual feature they form the background or framework of all but the smallest garden pictures. In planting any place of considerable size, trees and their positions are always considered first; the shrubs, which bear a similar relation in small places, the perennial and annual herbs, being considered in the order given. Hence the choice and placing of trees deserves the most careful attention of the planter. Among the species attractive for their foliage and general form are the beeches, birches, lindens, cedars, pines, and spruces; and among those which bear conspicuous flowers are various magnolias, the hardy catalpas, especially *C. speciosa*, which attains a large size and bears large leaves and a profusion of big, white blossoms. The horse-chestnut (*Æsculus hippocastanum*), with its large panicles of white flowers tipped with red, often attains 50 feet in height and is very popular as a lawn and street tree because it casts a dense shade. Other popular flowering species are *Paulownia*, tulip-tree (*Liriodendron*), golden chain (*Laburnum*), and locust (*Robinia*). Of the tender exotic trees which are cultivated only in warmer climates, perhaps few surpass the *Rhodoleia*, a small southeastern Asiatic tree with evergreen leaves and heads of four or five bright pink camellia-like flowers.

Prominently in front of the trees, or upon the margins of ponds in which their beauties may be reflected, the foliaceous and flowering shrubs may be placed in groups or singly. There is a vast list of these, especially of the blossoming kinds, but such as are perfectly hardy in any locality will usually be most satisfactory, since they need less attention as a general rule than specimens that must be coddled. Among the generally admired foliaceous species, the dwarf pines, spruces, and other conifers, willows, maples — especially the Japanese varieties — are perhaps most frequently planted; and among the flowering kinds, the barberry (*Berberis*), dogwoods (*Cornus*), spindle-tree (*Euonymus*), *Deutzia*, *Forsythia*, *Hydrangea*, lilac, *Rhododendron*, and *Spiraea* are general favorites of easy culture. In southern Florida and in parts of California many exotic species have been introduced. One popular shrub is the bottle-brush (*Collestemon*), an Australian evergreen with dense cylindrical spikes of usually red flowers. Some of these tender species are grown in greenhouses in cool climates, as are also various species of *Alloplectus*, tender tropical evergreens with yellowish tubular flowers.

Among the shrubs, partially disclosed and yet seemingly hidden, may be displayed the hardy perennials, such as *Yucca*, with its spire of creamy white blossoms which brighten sombre nooks, or the plume-poppy (*Bocconia cordata*), whose feathery panicles add airiness to rather heavy masses of foliage. Certain hardy perennials are, however, often planted in borders, for which purpose larkspur (*Delphinium*), foxglove (*Digitalis*), *Pentstemon*, sea-holly

(*Eryngium*), peony, and the spiræas are general favorites.

In the South, in California, and in northern greenhouses there is probably no vine so easily grown and so generally satisfactory as the *Bougainvillea*. The flowers are small and insignificant, but the large bract which subtends each blossom is usually bright red or purple. Since the plant quickly covers large areas and is very floriferous, it forms a brilliant covering which continues attractive often for months. It is largely used for training over arbors and piazzas in warm climates. Another popular climber of the same class (tropical) is the crab's-eye vine (*Abrus precatorius*), which grows about 10 feet tall, bears white, pink, or rose-colored flowers, and bright scarlet seeds, each with a black spot. It is often called weather-plant from its supposed powers of indicating the future state of the weather.

Among the host of plants grown under glass, one of the most striking is the gigantic Abyssinian banana (*Musa ensete*) with paddle-shaped leaves often 12 feet long by 3 feet broad, and with leaf stems as thick as a man's fist. Another noticeable though rather insignificant-looking plant is the fragrant olive (*Olea fragrans*) with a profusion of deliciously perfumed tiny cream-colored flowers. Probably the most important group consists of the palms which are so popular as pot and tub plants in decorations at church festivals, social functions, etc., and some of the smaller species of which, especially *Cocos weddelliana*, are largely used in table adornment. There are also many plants, such as *Coleus vriesia*, *Dicffenbachia*, and the ferns which are specially attractive for their odd or graceful foliage. The orchids, such as *Cattleya*, *Lalia*, *Dendrobium*, *Cypripedium*, *Odontoglossum*, and many others are grown for their flowers, their foliage being usually unattractive. Several species of *Euphorbia* are very popular, one, generally known as "poinsettia," being widely used for the whorl of scarlet leaves surrounding the insignificant greenish flowers, while another (*E. splendens*), known as "crown of thorns," is grown more because of its oddity and on account of the legend as to its use in the persecution of Jesus than because of its intrinsic beauty. This legend is also connected with several other spiny plants.

The most important species mentioned above will be found discussed either under their popular or generic names. See also FLORICULTURE; FORESTRY; HORTICULTURE; LANDSCAPE GARDENING.

De Cos'ta, Benjamin Franklin, American clergyman and writer: b. Charlestown, Mass., 10 July 1831. He entered the ministry of the Episcopal Church and was rector of the Church of St. John the Evangelist in New York 1863-99. In the year last named he became a Roman Catholic. Included in his many publications are: 'The Pre-Columbian Discovery of America by the Northmen' (1869); 'The Moabite Stone' (1870); 'The Rector of Roxburgh,' a novel under the pen-name of WILLIAM HICKLING (1873); 'Verrazano the Explorer' (1880); and 'Whither Goest Thou?' (1902). He became president (1884) of the first branch of the White Cross Society, of which he was the organizer.

Salvia sclarea.

De Coster, Charles Théodore Henri, shärl tã-ô-dôr ön-rê dè kôs-tã, Belgian poet: b. Munich 20 Aug. 1827; d. 7 May 1879. His first poetical composition was 'The Owls' Mirror'; then followed 'Flemish Legends' (1856); 'Brabant Stories' (1861), a spirited description of lowly life; 'The Wedding Tour' (1872); and the little comedy 'Jenny' (1865).

Decourcelle, Pierre, pē-är dè-koor-sël, French dramatist: b. Paris 25 Jan. 1856. His first work was the five-act drama 'The Ace of Clubs,' written for Sara Bernhardt, which had an extraordinary success. Then followed a succession of comedies, dramas, comic-opera libretti, and dramatizations of popular novels, written by him individually or in collaboration with other authors; among them: 'The Amazon' (1885); 'Madame Cartridge'; 'The Abbé Constantin' (founded on Halévy's story); 'The Man with the Broken Ear' (after About). He wrote also a sensational novel, 'The Gray Hat' (1887), and 'Fanfan' (1889), both of which were received with great popular favor.

Decoy, a place into which wild fowl are decoyed in order to be caught. A decoy pond is kept only in a secluded situation. Several channels or pipes of a curved form, covered with light hooped net-work, lead from the pond in various directions. The wild fowl are enticed to enter the wide mouth of the channel by tamed ducks, also called decoys, trained for the purpose, or by grain scattered on the water. When they are well into the covered channel they are surprised by the decoy-man and his dog, and driven up into the funnel net at the far end, where they are easily caught. There are differences of detail, but the general features of decoys are the same.

Decree, in general, an order, edict, or law made by a superior as a rule to govern inferiors. In law it is a judicial decision or determination of a litigated cause. The decree of a court of equity or admiralty answers to the judgment of a court of common law. In ancient history it signified a determination or judgment of the Roman emperor on a suit between parties. In the former German empire the resolutions of the emperor, declared to the estates of the empire, were called decrees. The old name of royal orders in France was *ordonnances* or *lettres*. The national convention, while it possessed sovereign power, used the expression, *La convention nationale décrète*; but the imperial government used the words imperial decree, for instance, in the famous decrees of Berlin and of Milan. In ecclesiastical history the term is especially used with reference to the authoritative decisions of councils. See BERLIN DECREE; MILAN DECREE.

Decrepitation, the crackling noise which several salts make when suddenly heated, accompanied by a violent exfoliation of their particles, due to the sudden conversion into steam of the water which is mechanically enclosed between the solid particles of the body; or to the unequal expansion of the laminæ of which the mineral is composed in consequence of their being imperfect conductors of heat. The true cleavage of minerals may be often detected in this way, for they fly asunder at their natural fissures.

Decretals, The (Decretales), (1) the second part of the Canon Law or *Corpus Juris Canonici*

(q.v.). It contains in five books the papal constitutions, laws, and decisions from the time of Gratian's *Decretum*, 1151 to 1234, when this second part was compiled by St. Raymond of Pennafort at the order of Gregory IX. The subject matter of each of the five books is expressed in the mnemonic hexameter verse:

Judicium, iudex, clerus, connubia, crimea;

meaning that the decretals of the first book relate to the constitution of tribunals, those of the second to the duties of judges, those of the third to the rights, privileges, etc., of the clergy, those of the fourth to marriage, and those of the fifth to offenses against the Church's laws.

(2) *The False Decretals*, or the *Pseudo-Isidorian Decretals* are a collection of decretals, gathered ostensibly by Isidorus Mercator, in the middle of the 9th century. The exact date and authorship of the document are not known; but as a canon of the Council of Paris (829) is quoted, the collection must have been made later than the year in which the council was held. Some modern historians claim that the collection was well known before the year 845. Rheims and Mayence are each given as the place where the work of collating and writing was done. The writer called himself Isidore Mercator, and in some MSS. "Peccator." (The writer may have had in mind the great St. Isidore, who had previously made a compilation of decrees and canons.) Historians claim that the name was, like the decretals, false. The collection was received at first as authentic. To have at hand and in convenient form all the decrees of councils and the decretal letters of deceased popes, was indeed a boon to be highly appreciated. It was known that letters and documents existed other than those to be found in any collection, so when this collection made its appearance, it was regarded as worthy of praise and thanks.

The collection opened with the 50 apostolic canons received and collected by Dionysius Exiguus; and these were followed by a number of decretal letters said to have been written by early popes, from Clement of Rome, one of the apostolic fathers, to Melchiades, at the end of the 3d century. None of the letters claimed to have been written by popes are genuine. Decrees purporting to have been promulgated at the councils of Nicæa and Seville, came next. Some of these are true. Then came other letters said to have been written by popes, beginning with Sylvester (who succeeded Melchiades) and ending with Gregory the Great. One letter in this collection, credited to Pope Siricus (384-399), is genuine. The last part of the compilation is a copy of the canons passed by Gregory II. (731) at the council held in Rome. Möhler, the German theologian, in commenting upon the fact that these decretals were at first so well received, almost without a dissenting voice, says: "Pseudo-Isidore seized exactly that in his own age which corresponded to the wishes of all the higher and better order of men. Thence it was that this legislation was so joyfully received. No one suspected anything false, because it contained so much that was weighty and true. If we examine carefully these invented decretals, and try to characterize their composer in accordance with their general import and spirit, we must confess that he was a very learned man, perhaps the most learned man of his time, and at the same time an ex-

tremely intelligent and wise man, who knew his age and its wants as few did. Rightly he perceived that he must exalt the power of the centre—that is, of the Pope—because by that way only was deliverance possible. Nay, if we would pass an unconstrained judgment, we may venture even to call him a great man.”

At the time of the appearance of the collection and for centuries afterward, its contents were so in harmony with the leading thought of Europe that the whole was accepted without thorough examination or criticism. Nicholas of Cusa, an able theologian of the 15th century, was the first one to express a doubt of the genuineness of the collection, and to advance proofs of the truth of his assertion. The Magdeburg Centuriators began investigations, and then many Protestant critics followed the same line of study, arriving at the same conclusion as that of Nicholas of Cusa. Finally, when the Isidore decretals were examined critically by theologians and historians, it was ascertained that nearly all were forgeries, and that anachronisms and blunders existed in large numbers. Phillips, Hefele, Möhler, and others show that in the whole collection there was nothing against the supremacy of the Pope, as had been advanced by some writers; that the letters said to have been written by popes were nearly all false, also that several of the spurious documents existed prior to the 9th century and may have been used in good faith by the compiler.

Consult: Hefele; Paulus Hinschius, ‘Decretales Pseudo-Isidorianæ’; Dumont; Möhler; Phillips; Knust; Rosshirt; Walter; Spittler; Wasserschleber; the brothers Ballerni.

Decuriones, magistrates in the provincial *municipia* of the Roman state, corresponding to the senate at Rome. Originally the popular assemblies had the sovereign power in the *municipia*, and conferred the executive authority upon the decuriones. They consisted at first of 10 men, but in later times they frequently numbered more, and sometimes even amounted to 100. Each *curia decurionum* was presided over by two members who were called *duumviri*, and whose powers within their *municipium* resembled those of the Roman consuls during peace. Under the republic the whole administration of the internal affairs of their respective cities was in the hands of the decuriones, but after the establishment of the empire they exercised nearly all the circumscribed rights of the communities, though finally they were little more than receivers of taxes. The decuriones were created by election, and each decurio was required to be at least 25 years old, and to possess a certain annual income. Their election took place on the kalends of March.

Dedekind, Friedrich, frēd’rīn dā’dé-kīnt, German poet: b. Neustadt on the Leine 1525; d. 27 Feb. 1598. His principal work is ‘Grobianus’ (1549), a satire in Latin distichs against drunkenness and obscenity; it had wide circulation, and was translated into German, Dutch, and English. He wrote two dramas having a religious polemic end in view: ‘The Christian Knight’; and ‘The Converted Papist.’

Dedham, Mass., town, county-seat of Norfolk County; on the Charles River about 25 miles from its mouth, and on the New York, New Haven & Hartford Railroad. The town is one of the oldest in the State, the first settlement

within the town’s limits having been made in 1635. The town is noted as having established the first public school in America supported by a general tax (1644). It has considerable manufacturing interests in cotton, wool, and clay, but its chief interests are connected with Boston, of which it is practically a suburb. Pop. (1900) 7,457. Consult: The town records; Man, ‘Historical Annals of Dedham.’

Dedlock, Lady, the wife of Sir Leicester Dedlock, in Dickens’ novel called ‘Bleak House.’ Outwardly cold and haughty, she is inwardly wretched in consequence of being haunted by recollections of her past life, and by fear that the existence of her illegitimate child, Esther Summerson, will be revealed. Lady Dedlock dies at the cemetery where her former lover is buried.

Deduction (Lat. *deducere*, to take away, to draw out), in logic, as opposed to induction, is the method of reasoning from generals to particulars, as the latter is from particulars to generals. Induction is the mode by which all the materials of knowledge are brought to the mind and analyzed; deduction, the process by which the knowledge thus acquired is utilized, and by which new and more complicated inductions are rendered possible. Thus every step in a deduction is also an induction.

Dee, John, English astrologer: b. London 13 July 1527; d. Mortlake, England, 1608. In early life he had devoted much of his time to mathematical, astronomical, and chemical studies; and in 1548 rumors began to prevail that he was addicted to the black art. They were probably well founded; and to avoid the consequences he went abroad. In 1551 he returned to England and through the instrumentality of Cecil, who presented him to Edward VI., obtained a pension of 100 crowns. The suspicion of the black art appears still to have clung to him, and shortly after Queen Mary’s accession he was charged with practising against the queen’s life by enchantment, and imprisoned. He obtained his liberty in 1555, and after Queen Elizabeth’s accession was consulted by Lord Dudley as to “a propitious day” for the coronation. Lilly’s account of him is that he was the queen’s intellenger, with a fixed salary; a great investigator of the more secret hermetical learning, a perfect astronomer, a curious astrologer, a serious geometrician, and excellent in all kinds of learning. The nature of his employments excited strong suspicion, and in 1576 he was furiously attacked by a mob, from which he had difficulty in escaping with his life. In 1578, during an illness of the queen, he was sent to consult with the German physicians and philosophers as to her recovery, and after his return was employed to draw up a sketch of the countries which, from having been discovered by English subjects, belonged to the crown. He accordingly prepared two rolls, giving both a geographical description and a historical account of the countries. These curious documents are still extant in the British Museum. After many wanderings, Dee, returning home, obtained from the queen in 1595, the wardenship of Manchester College, which he held nine years. It has been supposed, with some plausibility, that Dee’s character as an alchemist was merely assumed to enable him to act more securely and effectually as a spy in the employment of the English government.

Dee, the name of several British rivers. 1. A river in Scotland, partly in Kincardineshire, but chiefly in Aberdeenshire, one of the best salmon rivers in Great Britain. It rises on the southwest border of Aberdeenshire, and flows generally east, 87 miles to the German Ocean. The city of Aberdeen is at its mouth. 2. A river of North Wales and Cheshire; rises in Lake Bala, Merionethshire; flows north-northeast and northwest to the Irish Sea, 20 miles below Chester; length, about 80 miles. 3. A river of Scotland, county of Kirkcudbright, rises in Loch Dee. It flows southeast and south into Kirkcudbright Bay; length, 38 miles.

Deed, a written instrument under seal, containing a contract or agreement which has been delivered by the party to be bound and accepted by the obligee or covenantor. It has also been defined as follows: "A writing containing a contract sealed and delivered by the party thereto." (2 Wash. Real Prop. 553.) The law requires greater form and solemnity in the conveyance of land, than in that of chattels. This arises from the greater dignity of the freehold in the eye of the ancient law, and from the light and transitory nature of personal property, which enters much more deeply into commerce, and requires the utmost facility in its incessant circulation.

In the early period of English history the conveyance of land was ordinarily without writing, but it was accompanied with overt acts, equivalent, in point of formality and certainty, to deeds. As knowledge increased, conveyance by writing became more prevalent and ultimately by the statute of frauds and perjuries, of 29 Charles II., Ch. 3, secs. 1, 2, all estates and interests in lands (except leases not exceeding three years) created, granted, or assigned, by livery of seisin only, or by parol, and not in writing, and signed by the party, were declared to have no greater force or effect than estates at will only. And by the fourth section no person could be charged upon any "contract or sale of lands, or any interest in or concerning the same," unless the agreement or some memorandum or note thereof, was in writing, and signed by the party to be charged therewith, or some other person by him lawfully authorized.

With some trivial changes this statute provision has been adopted or assumed as law throughout the United States. Deeds must be upon paper or parchment, must be completely written before delivery, must be between competent parties, and certain classes are excluded from holding lands, and, consequently from being grantees in a deed; must be made without restraint; must relate to suitable property, and should be signed, sealed, and delivered. The consideration of a deed must be good or valuable and not partaking of anything immoral, illegal, or fraudulent.

A deed should be delivered and accepted. A delivery is the transfer of a deed from the grantor to the grantee, or some other person acting in his behalf, in such a manner as to deprive the grantor of the right to recall it at his option. An absolute delivery is one which is complete upon the actual transfer of the instrument from the possession of the grantor. A conditional delivery is one which passes the deed from the possession of the grantor, but is not to be completed by possession in the grantee,

or a third person as his agent, until the happening of a specified event. A deed delivered in this manner is an *escrow*, and such delivery should be always made to a third person. No particular form of procedure is required to effect a delivery. It may be by acts merely, by words merely, or by both combined, but in all cases an intention that it shall be a delivery must exist. It may be made by an agent as well as by the grantee himself. To complete a delivery, an acceptance must take place, which may be presumed from the grantee's possession. In a deed the premises embrace the statement of the parties, the consideration, recitals inserted for explanation, description of the property granted, with the intended exceptions. The *habendum* begins at the words "to have and to hold," and limits and defines the estate which the grantee is to have. The *reddendum*, which is used to reserve something to the grantor; the conditions; the covenants; and the conclusion which mentions the execution date, etc., constitute the formal parts of a deed and properly follow in the order observed here. The construction of deeds is favorable to their validity; the principal includes the incident; punctuation is not regarded; a false description does not harm; the construction is least favorable to the party making the conveyance or reservation; the *habendum* is rejected if repugnant to the rest of the deed. The *lex rei sitæ* governs in the conveyance of lands, both as to the requisites and the forms of conveyances.

Chancellor Kent, after observing that in the United States generally the form of conveyance is very simple, says: "I apprehend that a deed would be perfectly competent, in any part of the United States, to convey the fee if it was to the following effect: 'I, A. B., in consideration of one dollar to me paid by C. D. do grant, bargain and sell to C. D. and his heirs, the lot of land (describe it), witness my hand and seal, etc.'"

Deeg, dēg, India, town and dismantled fortress in Rajputana, state of Bhurtpore, 24 miles west of Muttra. It is situated in the midst of marshes, and almost surrounded by water during a great part of the year. At the southwest corner is the lofty rock of the Shah Boorj, on which the citadel stands. Deeg is a place of great antiquity, and contains a remarkably fine palace, only surpassed in beauty by the Taj Mahal of Agra. Holkar was defeated here by the British under Gen. Fraser in November 1804, and the following month the town and fortress were taken. Pop. 16,000.

Deems, Charles Force, American clergyman and writer: b. Baltimore, Md., 4 Dec. 1820; d. New York 18 Nov. 1893. From 1866 to his death he was pastor of the Church of the Strangers of New York, and was widely known as editor and author. Included in his publications are: 'Triumph of Peace and Other Poems' (1840); 'The Light of the Nations' (1870); 'Weights and Wings' (1872); 'Chips and Chunks for Every Fireside'; and 'My Septuagint' (1892).

Deemster, an officer once attached to the high court of justiciary in Scotland, who formally pronounced the doom or sentence of death on condemned criminals. The office was conjoined with that of executioner. The name is now given in the Isle of Man to two judges who

DEEMSTER—DEEP RIVER

act as the chief justices of the island, the one presiding over the north, the other over the south division.

Deemster, The, a novel by Hall Caine, called by the author the story of the Prodigal Son. It was published in 1877. The scene was laid in the Isle of Man, and opens in the latter part of the 17th century. The Deemster is Thorkell Mylrea, whose nephew Dan, the prodigal, deeply loves his cousin Myra; but her brother Ewan interferes and a duel ensues, resulting in the death of Ewan. Dan is tried and is declared cut off forever from his people, and banished to a remote corner of the island. During a visitation of the plague, Dan takes the place of Father Dalby, the Irish priest, effecting many cures and at last dying of the pestilence. A dramatization of 'The Deemster' was produced by Wilson Barrett under the title 'Ben-Ma-Chree.'

Deep Bottom, Va., Battles at. 1. On 25 July 1864, Gen. Grant, then besieging Petersburg, ordered a movement, the principal object of which was to threaten Richmond and draw as many of Lee's troops as possible from the lines in front of Petersburg, so as to give promise of success in assaulting them, upon the springing of a mine prepared by Gen. Burnside. Deep Bottom is opposite a great bend of James River, making a neck of land known as Jones' Neck, at a point where Bailey's Creek flows into the James from the north. Butler's pontoon bridges, one below and one above the mouth of the creek, were held by Gen. R. S. Foster with a brigade of the Tenth corps. The Confederates were entrenched on the west side of the mouth of the creek in Foster's front. About 2 A.M. of the 27th, Hancock began crossing the James by the lower bridge, to turn the Confederate left, while Foster attacked the right. At daylight all moved forward. Gen. Nelson A. Miles' brigade drove the Confederates from their position on the New Market road, east of the creek, and captured a battery of heavy guns, but progress across the creek was barred. From the river to Fussell's Mill, a distance of about two miles, its west bank was held by Kershaw's and Wilcox's divisions, joined during the day by Heth's division. On the morning of the 28th, Kershaw advanced on the Charles City road and drove Sheridan back over a ridge upon which he was posted; but Sheridan, dismounting his men, drove Kershaw back in some confusion, taking 200 prisoners and two colors. Reinforcements arrived until five eighths of Lee's army was now north of the James. Grant wanted no assault made, and on the 29th Hancock and Sheridan recrossed the James. The Union loss in this movement was 334 killed and wounded.

2. Gen. Grant, on 12 August, ordered another movement on the north side of the James to threaten Richmond. Hancock's Second corps, part of the Tenth corps, under Gen. Birney, and Gen. Gregg's division of cavalry, were designated for the purpose. Birney's command was at and near Deep Bottom; the cavalry and artillery went by land, as in July; and Hancock's corps marched to City Point and took steamers for Deep Bottom, 16 miles up the river, where it was landed on the morning of 14 August. Mott's division was to advance on the New Market road and drive the Confederates into their works beyond Bailey's Creek, while Barlow, with

his own division and Gibbons', was to move on Mott's right, and assault the line near Fussell's Mill. Gregg's cavalry was to cover Barlow's right, and when the infantry uncovered the Charles City and Darby roads, was to make a dash on Richmond, if opportunity offered, and if not, to destroy the railroads entering it. Birney was to attack the Confederate right, and, if successful, move up the river roads on Chaffin's Bluff. Field's Confederate division held Bailey's Creek and Wilcox's division was at Chaffin's Bluff. At the first intimation of Hancock's movement Wilcox moved up and joined Field, and from the south side of the James Gen. Lee sent Mahone's division of infantry and the two cavalry divisions of Wade Hampton and W. H. F. Lee. Johnson's and Gary's brigades followed, and there were three regiments from Pickett's division. Mott advanced on the New Market road, but was checked at the creek. It was 4 o'clock before Barlow, on his right could get up one brigade, and with this he assaulted the position near Fussell's, was repulsed, and rested for the night. On the right Gregg had advanced well up the Charles City road, and on the left Birney seized a part of the Confederate line and captured three guns. On the morning of the 15th Birney's corps and a brigade of Mott's division endeavored to turn the Confederate left. Birney moved toward the Charles City road, on which Gregg was advancing, but he made so wide a detour and found so many obstructions, that it was night when he found his proper position, and attack was deferred until morning. As a diversion to his attack Gregg's cavalry, supported by Miles' brigade of infantry, were to move up the Charles City road. Gregg was off at an early hour of the 16th, driving the Confederate cavalry beyond Deep Creek, as far as White's Tavern, only seven miles from Richmond. At 10 A.M. Terry's division of Birney's corps, supported by Craig's brigade of Mott's division, and Birney's brigade of colored troops, advanced against the Confederate line near Fussell's Mill, and, after a severe fight, carried it, taking three colors and between 200 and 300 prisoners from Mahone's and Wilcox's divisions; but the Confederates soon rallied, retook their works, and drove Terry back. Soon after noon the Confederate cavalry, supported by infantry, advanced on Gregg and Miles, slowly driving them back to Deep Creek, and later in the day across it. There was a cessation of hostilities on the 17th. On the 18th the Confederates advanced from their works above Fussell's Mill and attacked Birney, who, with the assistance of Miles, repulsed them. On the night of the 20th the Union troops were withdrawn and returned to their positions in front of Petersburg and at Bermuda Hundred. In this battle the Union troops numbered about 28,000, the Confederates about 20,000. The Union loss was 2,161 killed and wounded, and 625 missing. There are no returns of Confederate losses. Consult: 'Official Records,' Vol. XLII.; Humphreys, 'Virginia Campaign of 1864-5'; Grant, 'Personal Memoirs,' Vol. II.; Sheridan, 'Personal Memoirs,' Vol. I.; Walker, 'History of the Second Army Corps.'

E. A. CARMAN.

Deep River rises in Guilford County, N. C. Its general direction is southeast to Chatham County, where it unites with the Haw River and forms the Cape Fear River. Its

DEEP-SEA EXPLORATION

length is about 125 miles; it has good water power, some of which is utilized at Lockville.

Deep-sea Exploration. The exploration of ocean depths dates from 1867, when Pourtales and Mitchell, officers of the United States Coast Survey, engaged in systematic sounding and dredging in the Straits of Florida. From 1868 to 1872 a similar work was undertaken by Wyville Thomson, carpenter, and George Jeffries, in British vessels, sounding the Mediterranean and North Atlantic. Beginning in December 1872, and continuing until the spring of 1876, the *Challenger*, a British ship, under Nares and Thomson, made a tour of the world, taking soundings and dredging from 362 stations. France and Norway sent out expeditions for a like purpose at a later date. The Prince of Monaco also took great interest and did much sounding from his yacht, bringing up fish from a depth of two miles. Excepting the successful and complete work of the *Challenger*, most of the exploration valuable to science has been done by the United States, the Bibb making a tour in 1868-9, and the *Blake* doing continuous duty in this field from 1877 to 1880, under the co-operation of Agassiz, Sigsbee, and Bartlett, while the United States fish commission vessels, *Albatross* and *Fishhawk*, engaged in lengthy exploration under Baird, Belknap, Tanner, etc.

The average depth of the ocean is now known to be about $2\frac{1}{2}$ statute miles. Its floor has a contour very similar to that of the land, there being vast levels or plains, ravines, gorges, ridges and mountains that rise into islands, and deeps that fall farther below the sea-level than the topmost peaks of the Himalayas rise above that level. Light penetrates about 100 fathoms, or in specially clear water, under the direct rays of a tropical sun, to perhaps nearly 200 fathoms, and below it is all dark, except for the phosphorescence of some of the deep-sea inhabitants. The depths are also cold, approaching the freezing point in all latitudes. The cold waters from the frozen poles flow in slow currents along the bottom, over the dead marine organisms that strew the greater portion of the ocean floors, down to the deepest regions, where the bottom is of red clay of Tertiary formation.

The 100-fathom depth to which light penetrates has been termed the littoral region, and within this grow marine algae, and the animals that feed upon them. The depths below 1,000 fathoms have been termed the benthal area, while the area between 100 and 1,000 fathoms has been termed the abyssal area. The slopes along the edges of the continents, extending roughly 200 miles from land, constitute the region of terrigenous deposits, the sea bottom being composed more or less of the washings carried down by the great rivers that drain the continents. Besides the washings, which partake of the nature of the adjoining land, this region contains green coral, and volcanic mud. Beyond the influence of the shore washings comes the region of pelagic deposits, the ocean floor being strewn with dead marine organisms that have sunk from the littoral region.

The immense pressures of the great deeps below 3,000 or 4,000 fathoms are probably accountable for the fact that the dead organisms (so common to higher regions) are not found, but apparently dissolve and float away in the currents. The deepest holes have a bottom of

red clay that appears to have undergone no material change since the Tertiary Period.

Since there are no algae below the littoral region, it follows that all the marine animals below are carnivorous. None of these are ever brought up alive, since, if alive when netted, they succumb to the expansion that results from their being brought up to the surface where the pressure is so much below what they are constructed to reside in. The sea pressures are enormous, increasing from 15 pounds per square inch at the surface to a ton per square inch at a depth of 1,000 fathoms. The fish brought up from a depth of 3,000 fathoms are therefore subject to a surrounding pressure of three tons per inch of surface, a pressure that would be dangerous to a high-grade steel boiler. The deep-sea fishes do not succumb to it, because their tissues are porous, and the fluids of their bodies are of a like pressure with their surroundings. This maintains a balance that subjects them to no more strain than would a solid shot receive by being immersed at the same pressure. The bones of these fishes, instead of being built heavy to withstand a crushing pressure, are made fibrous and full of porosities, and include scarcely any calcareous matter. When these fish are brought to the surface their joints and muscles are found to be very loosely connected, and they have to be handled very carefully. Some of them are sure to break up with the least handling, as the *Plagiodus* of the Madeiran Sea. The deep-sea fishes universally are provided with air-bladders, and these of course tend to expand as the fish are brought up. Probably they could be brought up alive, if the speed of raising them were very slow. There are many deep-sea fishes that live at or near the surface when quite young, and go deeper as they advance in age. Nearly all the deep-sea fishes are classified among the same families as the fishes familiar on the surface, but the *Alepocephalida* and *Halosaurida* are found only in the depths.

At a depth of 400 fathoms the *Gobiida*, *Blenniida*, *Percida*, *Scorpenida*, *Trichiurida*, *Coltoidea*, *Cataphracti*, *Bathyrhtrissida*, and most of the *Trachinida* cease to exist. At a depth of 500 fathoms the sharks, rays, and flatfish are no longer found. At a depth of 700 fathoms the *Cottoidea*, *Discoboli*, *Zoarcida*, etc., disappear. The limit of the *Holocephali* is about 1,200 fathoms. The families commonly found at the greatest depths, 2,500 fathoms and under, are the *Berycida*, *Ophidiida*, *Pediculati*, *Macrurida*, *Sternoptychida*, *Scopelida*, *Stomatida*, and *Muraenida*.

Both the number and variety of fish decrease as depths increase, as the vast body of marine animals prefer to live near the surface.

The phosphorescent fishes are mostly characterized by luminous organs, which present all sorts of modifications as to location, appearance, and structure. Some of them are luminous all over when in motion and non-luminous when at rest, the brightness being occasioned by a luminous secretion emitted when the creature is active. Some of the deep-sea creatures are blind, others see by phosphorescent light, which they or other organisms emit. The fishes in the very great depths have small eyes, while those of moderate depths have large optical organs. Many deep-sea animals have highly developed feelers; the coloration of others is extremely

DEEP-SEA LIFE

brilliant, yellows, reds, greens, and purples being dominant colors, while there is a strange absence of blue. The fishes are mostly dark-colored, while the crustaceans, holothurians and starfish are the most brilliant, the colors being often in large patches of striking contrast. No deep-sea fishes above about five feet in length have been taken. This is not regarded as evidence that they do not grow longer, the fact that the mouths of the largest beam-trawls in use are only about 11 by 2 or 3 feet probably having something to do with the matter.

The dredge or beam-trawl commonly used is a form of big bag-net, of 20 to 25 feet in length, that is weighted and dragged along the bottom. As many as 800 fishes have been brought up in a single haul with such a dredge, from a depth of 1,770 fathoms, in Bering Sea. Four or five hours are required to dredge at such a depth. The deepest haul on record at which animal life was obtained was made by the Albatross of the United States Fish Commission, near the Tonga Islands, the depth being 4,173 fathoms. Ten hours elapsed from the time the dredge went overboard till it was brought again to the deck.

The tangle is a device used for bringing up specimens of fauna or anything it can catch. This consists of an iron bent in the form of an inverted V and having frayed rope attached to it. During recent years gill-nets have been used at a depth of a mile, and traps and trawl-lines have also been sunk to considerable depths.

The first reliable sounding at a great depth is credited to Capt. Sir James Clark Ross, who in 1840 sounded 2,677 fathoms on the west coast of Africa. Subsequent soundings were reported as deep as 7,000 fathoms, but as these were made with the old-fashioned clumsy apparatus that tended to drift tremendously, and as they do not agree with modern soundings, they are not credited. In 1854 J. M. Brooke of the United States navy, suggested the employment of a dropped weight in deep-sea sounding, and this was found to assist matters so much that it has remained in use ever since. The first attempts to substitute wire for rope were not very satisfactory, owing to the too great thickness and weight of the wire used. When steel piano-wire of great tensile strength was brought into use and weighted with a 60-pound shot, arranged to be dropped, it was found that the soundings were made with a close approach to accuracy, and at much greater speed in much less time than before.

In 1872 there was invented the cylinder sounding machine in which a cannon-ball was used for the sinker, the ball having a hole bored through it, in which was placed a metal tube or small cylinder. When the weight descended into the muddy bottom, the tube was filled with mud, and a device closed it, at the same time releasing the ball. Another device originated later consists of two hemispherical cups, normally hinged so as to be apart. When the weight strikes the bottom it brings the cups together, so that they grasp whatever is in the way. The wire used in soundings weighs about 14 pounds to the mile, and very ingenious reeling-machines have been devised for handling it. The first difficulty to be overcome was the roll of the ship, which tended to jerk the line. This is compensated for, and a friction device is adjustable so as to balance the weight of wire, etc.,

that is out. Elastic appliances, called accumulators, were devised by C. D. Sigsbee of the United States navy, and these have made it possible to employ steam power in paying out and reeling in the line.

The testing of deep-sea currents is done with the current-meter, the accepted form of which is hung on a wheeled traveler from the line sent down. A screw-propeller-like device rotates with the current, and there is a contrivance for registering the number of revolutions, from which registration the speed can be computed. The older devices, which were less satisfactory, depended upon the differential motion of surface floats to note the difference between upper and lower currents.

When it was first endeavored to take temperatures by thermometers at considerable depths it was found that the results were erroneous, apparently because of the increased pressure. Miller and Cassella invented a double thermometer that partially overcame the difficulty, but it served to register only the maximum and minimum temperatures. Negretti and Zambra improved on this, arranging the thermometer in reversed position while descending, and bringing it back to proper position at the depth of the test. The turn resulted in separating the column of mercury above the bulb, and the correct temperature could be indicated.

A most ingenious apparatus for reading the temperature of a descending sounding apparatus from the deck of a vessel has been designed by Sir William Siemens. He secures the temperature on the Wheatstone bridge principle, by the electric resistance of a conductor. A copper vessel of water is heated or cooled until the bridge balances, and the temperature of the water in the vessel is then the same as that below. The apparatus is unfortunately too delicate for ordinary use. All instruments sent down into the depths have to be protected against the pressure, their strength being proportioned to the depths to which they are to be used.

The deepest sounding made up to 1876 was that of the Tuscarora, of the United States Fish Commission, which reached 4,655 fathoms off the coast of Japan, in 1874. The Challenger's deepest sounding was also in Japanese waters, near the Admiralty Islands, the depth being 4,575 fathoms. In 1896 the British ship Penguin got 5,155 fathoms north of New Zealand, breaking the record. This was the deepest found until 1900, when the United States cable survey ship Nero found a depth of 5,269 fathoms near Guam. Other deep soundings are those of the Albatross of the United States Fish Commission, which located a depth of 4,813 in the western Pacific, and of the Blake of the United States Coast Survey, which sounded 4,561 fathoms off Porto Rico, this being the deepest yet recorded in the Atlantic Ocean. No deep places have been found north of the 55th degree of latitude, which tends to confirm the theory of some that the Arctic Ocean is shallow. Consult: Agassiz, 'Three Cruises of the Blake'; Sigsbee, 'Deep-Sea Sounding and Dredging'; Tanner, 'Deep-Sea Exploration.'

CHARLES H. COCHRANE.

Deep-sea Life. It is difficult to draw the line between deep-sea life and that of shallow water, owing to the various depths in which certain species live. Thus the common shore-crab

DEEP-SEA LIFE

of New England (*Cancer irroratus*) ranges to a depth of nearly 500 fathoms. The Challenger Expedition selected as defining the deep-sea fauna, a depth of 100 fathoms, others have taken 500 fathoms as marking its upper boundary, and still others a depth of 1,000 fathoms. A knowledge of this life is only obtainable by means of apparatus which will bring to the surface specimens from these great depths. The chief of these instruments, aside from the sounding lead which is very inadequate for this purpose, are dredges, tangles, and trawls, of which various patterns have been devised but which may be described in general terms as follows: The dredge consists of a rectangular frame-work of iron, one edge being sharpened or fitted with rake-like teeth to plow or scrape the bottom, while a net or bag fastened to the frame serves to hold the material collected and to bring it to the surface. This is best adapted for obtaining forms which live, attached to, or burrowing in, the ocean bottom. The trawl is a similar net so arranged as to be drawn just above the bottom and is valuable for collecting fishes which swim freely through the water. The tangle consists of large masses of unraveled rope, usually attached to a chain, which, sweeping over the ocean floor, entangles spiny forms like shrimps, starfish, sea urchins, as well as forms like hydroids and sea anemones, with numerous tentacles. Somewhat different is the Tanner net. This is so arranged that it can be sent down close to any desired depth, opened there, drawn through the water and then closed again before being drawn to the surface. By means of this the fauna of any desired depth can be collected without danger of admixture with forms from other depths. Details of the construction of these and many other pieces of collecting apparatus may be found in Agassiz, 'Three Cruises of the Blake'; Sigsbee, 'Deep-Sea Sounding and Dredging' (U. S. Coast Survey, 1880), and in the publications of the United States Fish Commission.

Although the dredge had previously been in use in the oyster and scallop fisheries it was first employed for scientific purposes (in moderate depths) by the Danish naturalist, Otto Fabricius Müller, 1750. (In America it was first used by Henry Wheatland of Salem, Mass.) Owing to faulty observations and to a belief that life could not exist in the greater depths of the ocean on account of the great pressure and the absence of light it was long thought that animals were not to be found at depths greater than 500 fathoms. This view disregarded the fact that Ross and Sabine, 1829, claimed to have obtained living animals from a depth of about 2,000 fathoms in Baffin Bay. Little by little evidence from sounding lines and submarine cables was accumulated which tended to overthrow this belief, but its complete disproval was accomplished by the dredgings of the United States Coast Survey in the Strait of Florida, 1867, when animals were found to be abundant at a depth of 700 fathoms. This was followed, 1869, by the expedition of the English ship Porcupine, which made successful casts of the dredge in 2,435 fathoms of water. Since that time numerous deep-sea dredgings have been conducted by the various governments, the most noticeable being the cruises of the English ship Challenger, the American Blake and Albatross, the French

Travailleur and Talisman, the Russian Minneh, the Swedish Vanadis, the Dutch Barents Expedition, the German Tiefsee Expedition, and the explorations of the Prince of Monaco. The results of all these go to show that life, even of highly organized types, occurs in the greatest depths of the ocean.

Since the dredge, tangles and trawls can touch but a minute portion of the deeper parts of the ocean bottom we have, as yet, but an inadequate knowledge of the benthic or abyssal fauna for details of which the reader should consult the reports of the various expeditions previously mentioned. In general the following remarks may be made. The greater the depth, the fewer the species present. Thus in the collections of the Challenger, 2,050 species were taken in depths between 100 and 500 fathoms; 710 between 500 and 1,000; 600 between 1,000 and 1,500; 500 between 1,500 and 2,000 fathoms; 340 between 2,000 and 2,500, and 235 from depths greater than 2,500 fathoms. Again the results of the same expedition show that the number of individuals also decreases with the depth. In depths of over 1,000 fathoms the dredge rarely captured over 10 or 15 specimens of any one species, while in lesser depths hundreds of a kind are common.

The majority of the abyssal forms probably live on the surface ooze of the bottom and the minute organisms occurring in it, while these forms are in turn preyed upon by larger rapacious forms. A prominent feature of these is the frequent occurrence of phosphorescent organs which probably serve as a lure. Some are blind, some are provided with very large eyes, and it seems certain that all the light in the greater depths of the sea is produced by the phosphorescent organs. Another feature is the large size of some of the individuals. Thus while the shallow water species of the hydroid *Monocaulus* reach a length of but two or three inches, the deep-sea form is three feet long. It was hoped that the deep-sea fauna would reveal living representatives of extinct groups, but this hope was not realized, nothing having been found older than the horse-shoe crab (*Limulus*) the brachiopods, *Ceratodus*, the Port Jackson sharks and the Dipnoi of shallower or fresh waters.

Taking now the separate groups of living forms occurring in the deeper waters the following general remarks may be made: Plants are extremely rare and include only a few minute and inconspicuous forms. Even the lower *Algæ* (seaweeds) so common in shallower waters are lacking. Among the sponges the so-called glass sponges (*Hexactinellidæ*) are most abundant, some of the species being enormous (3 or 4 feet in diameter). The *Calenterata* are represented by the giant *Monocaulus*, already mentioned, and by a few jellyfish and corals. All groups of Echinoderms occur, most noticeable being the comparatively large number of crinoids and of holothurians, many of which are strange in structure and bizarre in outline. The *Arthropoda* consists largely of prawns, schizopods and isopods, some of the latter being gigantic in size, and the strange sea spiders (*Pycnogonids*), some having slender legs extending a foot or more from the body. Crabs are rare, as are also annelids and molluscs, while a few brachiopods (and these not of the oldest types) occur. Possibly the most interest-

DEER—DEER-MOUSE

ing are the fishes. Many of these are noticeable for their strange shapes, and especially for the long and slender teeth and the distensible stomachs. Thus the *Chiasmodon niger*, the black swallower, has been taken with a fish, actually larger than itself, coiled up in its stomach. On the other hand, *Eurypharynx* and *Gastrosomus*, the pelican fishes, are eel-like forms with enormous mouths and with a trunk not as long as the lower jaw. These lack teeth and are supposed to live not upon other fishes but upon minute forms which they collect in their enormous scoop net. *Ipnops* lacks eyes but has nearly the whole top of the head converted into a pair of phosphorescent organs, while in the *Ceratiida* the head frequently bears tentacles with phosphorescent organs at their tips. The ribbon fishes (*Regalecus*), which are occasionally found floating, exhausted or dead, at the surface of all the seas, are presumably deep-sea forms, although none have been drawn up in the trawl. As the common name indicates they are band-like in appearance, and since specimens have been taken measuring over 24 feet long it is possible that these or larger specimens may form part of the basis of sea-serpent stories. A noticeable feature of all the deep-sea forms is the prevalence of red and brown colors. Many of the fishes when brought to the surface have the viscera forced out through the mouth by the expansion of the air in the swim bladder.

Two factors render life possible in the greater depths of the sea. The constant currents descending from the surface in the polar regions to the bottom and thence to the equatorial regions bring with them the necessary oxygen, although the amount of this gas present in the greatest depths is much less than at the surface. The other factor, that of food, is, in the last analysis, furnished by the constant death of surface (pelagic) forms, whose dead bodies, slowly sinking through the water, furnish the nourishment needed by the simple abyssal animals, which in turn are preyed upon by those more highly organized. The literature of deep-sea life is enormous. The student should consult the reports of the various expeditions mentioned above, especially those of the Challenger expedition. Many papers will be found in the publications of the U. S. National Museum and the U. S. Fish Commission, while general summaries are afforded by Agassiz's, 'Three Cruises of the Blake'; Moseley's 'Notes of a Naturalist' and Sir Wyville Thompson's 'Voyage of the Challenger.'

J. S. KINGSLEY,
Tufts College, Mass.

Deer, animals of the family *Cervidae* (q.v.), which are noted for their grace of structure and their fleetness of motion. Since the earliest times they have been known as objects of the chase, and their meat, "venison," is considered a delicacy. They were especially renowned in Greece; and we find many references to them in Scripture. The male deer is usually called a "stag," or when mature a "hart." The female is called a "hind," or "doe." The term doe, however, is applied also to females of the antelope family.

The deer is valued not only as food, but for commercial purposes. The skins make a peculiarly strong, soft leather, known to trade as

buckskin; this is valuable for shoes, saddles, etc. The skins with the fur on are sometimes used for tent-covering, and also make excellent rugs. The hoofs and horns are prized for ornamental purposes, especially the antlers of the roe-deer, which are utilized for making umbrella-handles, and for similar purposes; and the elk-horn, often employed in making knife-handles. The Chinese also make a medicine from stag-horn and they eat the antlers of certain species when "in the velvet."

The reindeer is, commercially considered, as valuable to the frozen north as the camel is to the desert traveler. Its fleetness and surefootedness, as well as its strength and power of endurance, render it invaluable to man in the far North. Consult: Lydekker, 'Deer of All Lands' (London 1898); Roosevelt (and others), 'The Deer Family' (New York 1902). See *CERVIDÆ*, the names of various genera, and English names, as ELK, MOOSE, etc.

Deer Forests, large tracts of waste or uncultivated and mostly uncultivable land, chiefly situated in the Highlands of Scotland, set apart as grounds in which the stag or red-deer is hunted for sport, but is otherwise protected and allowed to roam in its natural wild state. The name forest does not in this case imply the existence of trees. As a matter of fact most deer forests are mountains or high-lying stretches of ground, exhibiting large areas covered with heath, in many places peat-bogs, marshes, lochs, or bare rock, elsewhere patches of grass or other herbage, while plantations of trees of greater or less extent may also occur. Some of the deer forests are of very great extent, the larger covering, say, from 50,000 to 70,000 acres. The counties in which they are chiefly situated are Sutherland, Ross and Cromarty, Inverness, and Argyre, while they also exist in Aberdeen, Banff, Forfar, Perth, and Caithness. A number of them are retained in the hands of their proprietors, while many others are let, either for the shooting season or for a period of years, and in this case may bring a large rental to their owners. The annual letting value of the larger deer forests may run from £1,000 to £4,000 or even more, and the total rental of the deer forests of Scotland has been set down at over £200,000 per annum. Every stag killed costs the person who rents the ground about 50 guineas. For a deer forest is always an expensive affair, not only for the rent that has to be paid, but also for the number of keepers, gillies, watchers, beaters, etc., that have to be employed in connection with it.

Deer-grass (*Rhexia virginica*), the American representative of the Asiatic family of plants called *Melastomaceæ*, meadow-beauty family, of which only 10 species are found in the United States. The deer-grass extends from Maine to Florida, and west to Illinois, Missouri, and Louisiana. Other species extend the habitat of the genus to Texas. The flowers are conspicuous and showy, with bright rosy purple petals, and render the meadows unusually gay when adorned with patches of this lovely plant, entitling it to the common name of the meadow-beauty.

Deer-mouse, the common white-footed mouse of North America, a rodent of the family *Muridæ*, genus *Hesperomys*. The main color of its body is buff or fawn, growing dark along

SAMBUR (*Cervus Unicolor*).

DEER-STALKING — DEFAUX

the back, the feet and under parts being snowy white. With full, bright eyes, high, rounded ears, long whiskers and tail, graceful and sprightly movement, it is a very attractive little animal. It has been found to have small cheek-pouches. Its length rarely exceeds four inches, its tail being nearly as long. In different sections of the country its markings and habits are varied, and in some it seeks a home in the human dwelling, as do other mice.

Deer-stalking, an exciting but laborious mode of hunting the red-deer, in which, on account of the extreme shyness of the game, their far-sightedness and keen sense of smell, they have to be approached by cautious manœuvring before a chance of obtaining a shot occurs. Great patience and tact and a thorough knowledge of the ground are essential to a good stalker, who has to undergo many discomforts in crouching, creeping, and wading through bogs, etc. Advance from higher to lower ground is usually made, since the deer are always apt to look to the low ground as the source of danger. "Deer-driving" toward a point where the shooters are concealed is often practised, but is regarded as poor sport by the true deer-stalker.

Deerfield, Mass., a town of Franklin County, on the Connecticut River, and the Boston & Maine, and the New York, New Haven & Hartford R. R.'s; 33 miles north of Springfield. It is an agricultural region, and its industries are chiefly related to agricultural products. It has a high school and public library. The town contains the village of South Deerfield, and in colonial times was the scene of several contests with the Indians. Among them were the "Bloody Brook Massacre" (1675), and the burning of the village by the French and Indians under De Rouville (1703). Old Deerfield has a beautiful soldiers' monument, and there is at South Deerfield a marble monument commemorative of the Bloody Brook disaster. Eliza Allen Starr, author and art teacher, was born in Deerfield. Pop. (1900) 1,969.

Deerfield River, a river in Massachusetts, rising in southern Vermont and flowing generally southeast for 60 miles, when it enters the Connecticut River. The great fall of the river of nearly 1,100 feet in 50 miles furnishes water power at many places, of which the chief are at the Hoosac Tunnel and Shelburne Falls. Several streams nearly as large as the main river enter it from the north.

Deerhound, a Scotch greyhound, with a shaggy coat, covering his body, except the legs and tail. He is somewhat heavier than the English breed of greyhound, as well as somewhat larger. As the name suggests, this dog was employed for deer-hunting; and one of its older names was "buckhound."

Deerslayer, *The*, the last published (1841) of the 'Leatherstocking Tales,' by J. Fenimore Cooper, though written many years before its appearance. See **NATTY BUMFUS**.

De Facto, *dē fāk'tō* (Lat. "in fact"), a legal term used in contradistinction to *de jure* (by right). It is commonly used in regard to governments, some of which are supposed to be based on divine right, others on usurpation. A *de facto* government, when established, is now always recognized as *de jure*. The term *de facto*

is often applied in ordinary administrative law to designate the practice of illegal authority which has been exercised under apparent right.

Defamation, the speaking or writing words of a person so as to hurt his good fame. Written defamation is termed libel, and oral defamation slander. The provisions of the law in respect of defamation, written or oral, are those of a civil nature, which give a remedy in damages to an injured individual; or of a criminal nature, which are devised for the security of the public. Slander was recognized as an individual wrong, and an offense against the public peace, at an early period of the English law. Libel was hardly known. This, however, is not strange; it is not to be supposed that it would have been, among an illiterate people, few of whom could write, and not many could read. Until education and learning had made considerable progress, and with them the arts and sciences, the offense of libel was comparatively rare. Libel had only very narrow limits in rude and despotic times, and not the same precision it has acquired in the days of liberty and science. As soon as writing became general it was used for abuse. People became jealous of their characters and reputations, which they found were thus in the power and at the mercy of every malicious writer, and then they claimed, as one of their first and absolute rights, the protection of character and reputation against a weapon more potent than slander, because committed to writing, and consequently more lasting and impressive and more dangerous to society. This was the mischief which the law of libel was designed to restrain. And when printing came into more general use it became more and more apparent that the law of libel was founded in reason and justice, and thus as learning progressed the law of defamation spread its influence, and finally placed a wholesome restraint upon the printing-press, as well as upon the instruments of the author, the critic, the painter, and the poet. The law forbids revenge, and the tongue is restrained. Character and reputation are treated as the safeguards of social position and success in life. They have always been recognized as absolute individual rights. Libels and defamations are classed as private injuries of the highest degree by Justinian in his 'Institutes.' Words are slanderous, and actionable *per se*, which impute to the party the commission of some criminal offense involving moral turpitude. Words which impute to the party spoken of unfitness to perform the duties of an office or employment, or which charge that a party is infected with a contagious disease, etc., are slanderous. A libel is anything which is written, printed, published, or pictured, calculated to injure the character of another by bringing him into ridicule, hatred, or contempt.

Default, a failure to appear in any court on the day assigned; especially applied to a defendant when he fails or neglects to plead or put in his answer on an appointed day. In such cases the plaintiff is entitled to sign judgment against him, which is called judgment by default, and the defendant is said to suffer judgment by default.

Defaux, *Alexandre*, *ā-lēks-āndr dē-fō*, French landscape painter: b. Bercy, near Paris, 27 Sept. 1826. He was a pupil of Corot, and his paintings display remarkable understanding of

perspective. He began to exhibit in the Paris Salon in 1859 and among his numerous landscapes are: 'View at Caen'; 'Abandoned Race Course at Ivry'; 'View of St. Maur, Coast of Gravelle' (1863); 'Evening in Spring' (1869); 'Fine Winter Day in Bas Meudon' (1873); 'The Loire after a Flood' (1873); 'Birches at Fontainebleau' (1874); 'Gravel Pit at Fontainebleau' (1877); 'Forest of Fontainebleau' (1879); 'Harbor of Pont-Aven' (1880); 'Old Birch-trees at Pigeon Pond in Fontainebleau'; 'Low Tide in Normandy' (1884); 'After the Storm' (1885).

Defeasance, *dē-fē-zans*, **Deed of**, in law, an instrument which defeats the force or operation of some other deed or estate; and that which in the same deed is called a condition, in a separate deed is called a defeasance.

Defectives, **Education of**. Systematic care of the defective classes began in America in 1815, when a young theological student, Thomas Hopkins Gallaudet (q.v.), started for Europe to study methods of teaching the deaf and dumb. A school for this class was opened in 1817, one for the blind in 1831, and one for the feeble-minded in 1845—practically 15 years apart. In each case the first schools were in New England, the second in New York, the third in Pennsylvania; and these schools followed one another quickly. All started in the face of more or less distrust as to their feasibility, and all were experimental, being started through private initiative. A few pupils were taught and exhibited before the amazed public, when in the case of the deaf and the blind private funds in abundance were contributed and the schools quickly established as private corporations. In the case of the feeble-minded the first school to be incorporated was a public organization—that is, it was supported by the State. Before 1822 the State had not been educated to the point of supporting schools for the special classes, but by 1848 it was ready to see its duty toward even the idiotic. The three States named having led the way, the movement spread quickly into Ohio, Kentucky, Virginia, and Illinois—in almost identical order for each special class. Here, however, the schools arose as State institutions. It had become an accepted part of public policy for the State to provide a means of education for all her children. The superintendents of the early schools for the deaf and dumb were generally clergymen; those of the blind and the idiotic, generally physicians. The institutions were necessarily boarding schools; and the early ones were established as a rule in or near the State capitals, chiefly that their achievements might be kept before the members of the legislatures, on whose practical sympathy their continuance usually depended. The large private or semi-public institutions are confined to the eastern States. Their support comes chiefly from private bequests and the interest on invested endowment funds. All, however, receive what is termed State aid, and make annual report to the State legislatures, to the commissioners of public charities or of public education. All are governed by honorary boards of trustees or managers, who appoint the superintendent or principal. In the semi-public organization the managers form a self-appointing, close corporation; in the public, they are appointed usually

by the State governor, by whom they may also be removed. The semi-public institutions are usually well endowed. Their expenditures are, thus, not limited by legislative grant; and they are free from political interference, an influence which has sometimes seriously affected the State institutions. As a rule, the institution plants are large and well equipped, and even when in cities have ample lawns and playgrounds. The earlier institutions were built on the congregate plan; the later have generally adopted the segregate or cottage plan. The pupils are not committed to these institutions, but are admitted or rejected by the boards of trustees on the recommendation of the superintendents. The early institutions for all three classes of defectives began purely as schools. And all those existing to-day, except those for the feeble-minded, discharge or graduate all pupils after these have completed the course of instruction. A very recent movement, started by the instructors of the deaf, is the affiliation of the educators of the defective classes with those of the national education association. It is being more and more recognized that the line between a defective and a normal child cannot be drawn hard and fast, and that many a child who appears dull and stupid in school is in some measure defective. Systematic work for the deaf and dumb, the blind, and the feeble-minded began in France, and from France America learned the early methods.

The Deaf.—About the middle of the last century three schools for the deaf and dumb were opened in Europe. Though they sprang up about the same time they were wholly independent in origin. In Paris the Abbé de l'Épée having observed two deaf-mute sisters conversing by means of gestures, seized upon the idea that in gesture language lay the secret of instructing the deaf and dumb. He therefore elaborated a system of gesture signs and made it a medium of instruction in the school which he started. Heinicke in Dresden and Braidwood in Edinburgh simply adopted articulate speech as the language of man and taught their pupils through it, requiring them to speak and read the lips of others. Reports of their success having reached America, several parents of deaf-mutes sent their children to Scotland to be educated. These deaf children returned no longer as mutes; they were able to converse readily by speaking and lip reading. One of these parents published a book in London, wrote articles for the New England periodicals, with the intention of arousing interest in the new work, and took steps to ascertain the number of deaf-mutes in Massachusetts. In 1812 a little school for deaf and dumb pupils was opened in Virginia, having for teacher one of the Braidwood family, who had come to America. The school was the first of its kind in America. It was soon given up, as was a similar effort in New York. These events though seeming to result in little, yet had great effect in directing intelligent attention to this field of work.

A physician of Hartford, Conn., one of whose little daughters had become deaf, spent eight years in agitating the question of starting a school for such children. Thomas Hopkins Gallaudet was sent abroad to study methods. He went to Great Britain to study the only method that Americans knew about; but the

DEFECTIVES

doors of the British schools were closed to him. He found the science and art of teaching the deaf regarded as a business monopoly. After nine months he gave up hope of acquiring the Braidwood method and spent at the Paris school the three remaining months of the year. This time being far too short he induced a deaf-mute teaching in the school to accompany him to America. This was the brilliant and accomplished Laurent Clerk, who became an engine of power for establishing schools for deaf-mutes in our country. The French method or sign-language method was improved and further systematized by our early teachers and in this form was the basis of instruction in all our schools for half a century. During the absence of Dr. Gallaudet the Connecticut Asylum at Hartford had been incorporated, but soon changed its name to the American Asylum, for it was then supposed that one school could accommodate for many years all the pupils of the country. Upon Dr. Gallaudet's return he and Mr. Clerk traveled for eight months among prominent cities in behalf of the cause of the deaf. On 15 April 1817 school work began at Hartford with seven pupils. During the year 33 pupils came. This was the first permanent school in the country. The founders of our schools differing from practice abroad, immediately established theirs on a permanent basis. Private aid was necessary at first, but no sooner had the feasibility of the work been shown than public moneys were granted.

In 1818 a school was opened in New York under a teacher from Hartford. In Philadelphia a little class started in 1819 was organized as an institution in 1820. In 1819 Massachusetts had provided an appropriation for the education of 20 indigent pupils at Hartford, and in 1825 New Hampshire and Vermont adopted the same policy, being soon followed by other States. Thus, through the efforts of the founders of the Hartford school, the policy of educating deaf-mutes at the public expense was firmly established in the United States, and has been adopted with few exceptions. Some of the western States secured means for the education of deaf-mutes by constitutional provision. Two years after the founding of the Pennsylvania school, Kentucky followed with its institution, being the first to be supported by a State. Ohio and Virginia soon followed. Thereafter institutions sprang up rapidly in the South and West. In 1857 there was incorporated by Congress the Columbia Institution at Washington, D. C., which requires special mention. Though originally intended as a school for educating the deaf children of government beneficiaries, a change largely owing to the energy of its principal, Dr. Edward M. Gallaudet, soon enabled the institution to confer collegiate degrees. It was then divided into two departments, the advanced taking the name of the National Deaf-Mute College. Thus, in 1864, America had taken a step "unprecedented in the history of deaf-mute instruction."

Most of the deaf and dumb are either born deaf or become so before acquiring language. They are dumb because they are deaf, and without special instruction can never know any but a gestural language. The pioneer educators of the deaf in this country were all "broad-minded men of liberal education," and they set a high standard at the outset for the work. A

language of signs they saw was the key to the instruction of their pupils, who, indeed, were allowed so few years of schooling, that no time was to be lost in laboring over the extraordinary difficulties of teaching them speech. The language of signs is ideographic—"being readily expressive of ideas and emotions," rather than of phraseology. Put into words their order is very different from the natural order. The late superintendent of the Illinois institution, Dr. Gillett, writes: "When reduced to a system they [signs] form a convenient means of conveying to one mind the ideas conceived by another, though not clothed in the language in which a cultured mind expresses them. One addressed in the sign language receives the idea and translates it into English without any intimation of the phraseology in the mind of the speaker, so that a dozen persons familiar with the sign language, observing the gesticulations of a speaker, would each translate correctly the thoughts given forth, but no two of them would be in exactly the same phraseology. It is a concrete language, in which the expression of abstract ideas is exceedingly difficult." As the ideas are given out chiefly by means of hand gestures, schools using the sign language as a means of instruction are said to follow or use the manual method. Among the manually taught deaf this language early becomes the vernacular. As it is a language of living pictures, such deaf people think in pictures and dream in them. The sign language is said to be to the deaf what spoken language is to the hearing; and yet its use in the school room is deemed by many teachers extremely detrimental to the acquisition of the English language, which all our educators of the deaf agree is their chief end and aim for their pupils. They differ widely, however, over the use of signs. The greater number believe a moderate use of them to be economical of time and extremely useful to the deaf in the acquisition of knowledge. There is a small but growing number who dispense with signs *in toto* just as soon as possible. These latter teach by the intuitive, direct, or "English language method." They teach English by and through English, spoken, read, and written. It is extraordinarily difficult to get started by this oral method. But its advocates claim that once well started their pupils advance more logically, more surely, more precisely, and finally more swiftly than pupils allowed to use signs. Advocates of using the signs together with other means claim that the minds of most of their new pupils are sluggish from want of language to think in, and that they need to be aroused by the quickest method. They assert that "A large percentage of the deaf under proper methods can obtain a very useful amount of speech and lip-reading, but [that] there is also a large percentage of them that would be greatly restricted in their mental development, if allowed no other means of instruction." A proper and conservative use of the sign language always tends to mental development, saves time, and is the most efficient aid known in the acquisition of written and spoken language." The other school affirms that the two methods or systems are mutually exclusive, saying: "Of course no pupil can be taught under the intuitive and the sign method at the same time, and it is impossible to combine into one system a method which is depend-

DEFECTIVES

ent upon the sign language at every stage of instruction with a method which dispenses absolutely with the sign language at every stage in teaching the English language. In the sign-language method instructors aim to teach the vernacular language through the intervention of signs, but their deaf-mute pupils acquire a mixture of natural signs, pantomime, conventional signs and finger spelling which becomes the habitual vehicle of thought and expression, wherever it is possible to use a gestural language, to the exclusion of the English language." A form of the English language method, taught at the Rochester, N. Y., institution, substitutes finger spelling for signs as these methods are used in manual schools, and is called the "manual alphabet method."

The history of the rise of the oral method is interesting. As has been said, the manual method reigned supreme for the first 50 years of the work. In 1843 Horace Mann, secretary of the Massachusetts State Board of Education, and Dr. Howe, director of the Perkins Institution for the Blind in Boston, made a tour of Europe. In his next annual report Horace Mann praised the oral method as taught in Germany, stating that it was superior to the method employed in America. The report was widely read, and caused no little commotion among our teachers of the deaf. Several went abroad to see for themselves, but did not agree with Horace Mann, and little change was then made in American methods. Still as a result of their recommendations, classes in articulation were introduced into several schools. Later, in 1864, there was an agitation in Massachusetts for the incorporation of an oral school in that State, and a small private school of the kind was soon opened near Boston. In 1867 the Clarke Institution (named for its founder) was incorporated by the Massachusetts legislature, and was opened as an oral school. In the same year a former teacher of an Austrian school opened in New York what soon became the New York institution for the improved instruction of deaf-mutes. Dr. Edward M. Gallaudet after investigations abroad reported that if the whole body of the deaf were to be restricted to one kind of instruction, he favored results to be obtained by the manual methods of America, but he advocated the introduction of articulation into all the schools of the country. A conference of principals of American institutions adopted resolutions in the line of President Gallaudet's recommendations, and classes in articulation were very generally introduced. During the next few years a gradual movement abroad toward the abolition of signs was evident; and at the second international conference at Milan in 1880, an overwhelming majority of the delegates present voted in favor of the oral method. American instructors of the deaf paid more and more attention to the question of methods, and conventions of articulation teachers were held. In the meantime Dr. Alexander Graham Bell had introduced to teachers his father's system of visible speech (q.v.). A similar but simpler system of visible speech symbols had been independently worked out by a Mr. Zera Whipple, of Mystic, Conn.; and more recently the Lyon phonetic manual has been devised, which is founded on the principle of visible speech and may be written in the air by the fingers. In 1888 the royal commission of the United King-

dom voted "that every child who is deaf should have full opportunity of being educated on the pure oral system," but that those found physically or mentally disqualified "should be either removed from the oral department of the school or taught elsewhere on the sign and manual system." In 1890 the American association to promote the teaching of speech to the deaf was incorporated, with Dr. Alexander Graham Bell as president. Dr. Bell immediately endowed the association handsomely. It cannot be denied that at times the controversy over methods has been bitter; to-day, however, it has been reduced to a generous rivalry, in which the champions of the various methods and systems are striving earnestly to find out the best means of instructing the deaf and to pursue it. The majority of our schools do not limit their teaching to any one method, but are eclectic, calling themselves "combined system" schools. The work for the deaf in this land has progressed remarkably. No other country has so many deaf pupils under instruction as this has, none has provided so generously for them, and there is none in which their educators are more alert to test new inventions and appliances that may bear upon the methods of instruction. And yet, unquestionably, the education of the deaf is still in its youth.

Soon after the beginning of the work 'The Annals of the Deaf' was started (now in its 44th volume). It is said to be the leading publication of its kind in the world. Its editor, Dr. Edward A. Fay, has made a most thorough investigation into the results of marriages of the deaf. The Volta prize of 25,000 francs awarded by the French government to Dr. Bell for his invention of the telephone, he applied to the founding of a bureau for the purpose of collecting and diffusing knowledge concerning the deaf. This is the Volta bureau of Washington, D. C. It has already published a large number of papers, studies, and books. The influence of Dr. Bell upon the work for the deaf has been deep and lasting. The invention of the telephone itself resulted from his experiments upon a device which he hoped would enable the deaf to read the vibrations of the human voice. Though a Scotchman by birth, he is practically an American, and has devoted his best energies and his means to furthering the work which he has made his profession. His great efforts have been toward the promotion of speech-teaching to the deaf.

As Dr. Gillett has said, "The instruction of the deaf is one of the most difficult fields in the entire department of education for achievement at once successful and satisfactory to the teacher." For many years the parent school at Hartford was parent in the sense of providing principals and teachers for other schools. The New York institution has also furnished schools with many officers and teachers. It is only within comparatively recent years that normal classes, as such, have come to exist in a few of the schools. Among others, the Clarke Institution, the Wisconsin Phonological Institute, the school at Bala, Pa., and Gallaudet College have them—the latter announcing that it has opened to a limited number of college graduates annually, normal fellowships of \$500, tenable for one year. Thus has the standard of deaf-mute teaching come to be in line with

DEFECTIVES

modern university methods of training teachers. Public day schools for the deaf have sprung up in various places. The Horace Mann School of Boston is a notable example. They fill an unquestioned need, as many parents refuse to send their deaf children off to an institution. A still further movement toward decentralization has come to pass in Wisconsin. Wherever in this State a few deaf children can be gathered near their homes, State aid will be given to pay teachers sent there to teach them. And this movement is tending to become more and more general. All these day schools spread the oral method. An important effect of the rise of this method has been the lowering of the age when deaf children are received, and of lengthening their term of instruction; also of largely increasing the number of women teachers employed. The Home at Bala for the training in speech of little deaf children before they are of school age, takes them at the age when normal children learn to talk and teaches speech by talking to them and having them talk back as if they heard. There are several private oral schools for the deaf in this country where the pupils pay tuition. One of the best is the Wright-Humason school in New York. With the lowering of the age of pupils, kindergarten methods have been made use of more and more; though no true kindergarten can be conducted in schools where language comes so hard and so late, where even natural signs are arbitrarily interdicted, and where there can be no music. But the occupations and the games are widely applicable and are now universally used. The first duty of the teacher is to establish communication with the deaf child and thereafter, during his whole course at school, more than in any other kind of educational work, to make language the end of training and other subjects the means of varying language teaching. This statement is strictly true only of elementary education, but then the majority of deaf pupils do not advance far beyond the elementary stage, because so very much time is absorbed in language work that their progress in other things is slow; then, too, parents are prone to call their boys away from school as soon as they believe these can help sustain the family. A few of the brighter and more ambitious pupils from the schools take the course at the National Deaf-Mute College, now called Gallaudet College, where they have "an opportunity to secure the advantages of a rigid and thorough course of intellectual training in the higher walks of literature and the liberal arts." Occasionally we hear of deaf pupils taking high school work in schools with hearing pupils, and even of being graduated from colleges of the hearing.

The course of training at American schools for the deaf has always been practical. Indeed, industrial training is almost essential for those young people who would form industrious habits and facility in the use of tools, that will put them on their feet when they enter the world of labor; for most deaf pupils will have to work for their living. The trained deaf are not at all disqualified from self-support by simple inability to hear. In their schools general manual training is followed with a pupil until, for one reason or another, he chooses his trade or it is chosen for him. The general equipment for trade teaching is excellent. Printing is an ex-

tremely useful occupation for the deaf, especially in the acquisition of idiomatic language; and every institution for their instruction publishes one or more papers. Our educated deaf people form a quiet, well-behaved, self-supporting part of the community. They have formed local and national societies for mutual benefit. The convention of the deaf that met in 1893 at the Columbian Exposition at Chicago was the largest meeting of the kind ever held. Their speeches and deliberations and social gatherings occupied several days. Within the grounds of Gallaudet College at Washington stands a beautiful memorial statue of Gallaudet teaching a little deaf and dumb girl. It was presented to the college by the deaf of the whole country. In this memorial the deaf have made fitting recognition of their indebtedness to education.

The Deaf-blind — "Obstacles are things to be overcome" is the motto given by Dr. Howe to the Perkins Institution for the Blind. When this remarkable man learned in 1837 that up in the mountains of New Hampshire there was a little girl not only blind but also deaf and dumb, he eagerly sought out the child and obtained the parents' consent to take her to South Boston to be educated. He had already formed a theory as to how he would reach a mind thus doubly shut in, and with the finding of Laura Bridgman came the wished-for opportunity to test this theory. It should be noted that Laura Bridgman saw and heard until she was two years old. She had been rather a delicate child, however, having enjoyed only about four months of robust health, when she sickened, her disease raging with great violence during five weeks, "when her eyes and ears were inflamed, suppurated and their contents were discharged." Her sufferings continued for months, and it was not "until four years of age that the poor child's bodily health seemed restored." She was intelligently active, following her mother about the house, seeming anxious to feel of everything, and thus to learn about it; and she developed signs for her father and her mother, and for some things.

She was eight years old when brought to the Perkins Institution. Dr. Howe writes: "There was one of two ways to be adopted: either to go on and build up a language of signs on the basis of the natural language, which she had already herself commenced, or to teach her the purely arbitrary language in common use; that is, to give her a sign for every individual thing, or to give her a knowledge of letters, by the combination of which she might express her idea of the existence, and the mode and condition of existence, of anything. The former would have been easy, but very ineffectual; the latter seemed very difficult, but, if accomplished, very effectual; I determined, therefore, to try the latter." After the child had become adjusted to the change of homes, Dr. Howe began teaching her by means of common articles with which she was familiar — spoons, forks, keys, etc., on which labels with their names printed in raised letters had been pasted. Similar detached labels were given her to feel. Her touch was acute enough, hence she was able to match labels, placing that for book on the book, etc. She did this easily and willingly because she received approbation for so doing; but the idea that the printed word stood for the name of the object had not entered her brain. Then other detached

DEFECTIVES

labels were cut up into their component letters. These her memory soon enabled her to build into wholes or the words she had felt. Such exercises continued for many weeks to be only a meaningless play to the poor child. The success had been "about as great as teaching a very knowing dog," when suddenly the idea flashed upon her that "Here was a way by which she herself could make up a sign for anything that was in her own mind, and show it to another mind, and at once her countenance lighted up with a human expression; it was no longer a dog or parrot,—it was an immortal spirit, eagerly seizing upon a new link of union with other spirits! I could almost fix upon the moment when this truth dawned upon her mind, and spread its light to her countenance; I saw that the great obstacle was overcome, and that henceforward nothing but patient and persevering, plain and straightforward efforts were to be used." Next, she was given metal type each bearing some embossed letter, and a frame with holes to receive them. With this appliance Laura readily wrote the name of any object she knew and by writing them fixed in mind an extensive vocabulary of common names. Then the less cumbersome manual alphabet was taught her. Here was a means by which she could both write and read; she could spell to her teacher and read what her teacher spelled into her hand. Dr. Howe's reports teem with interesting psychologic material. At the end of the year he writes: "She is nine years of age, and yet her knowledge of language is not greater than a common child of three years. There has been no difficulty in communicating knowledge of facts, positive qualities of bodies, numbers, etc.; but the words expressive of them, which other children learn by hearing, as they learn to talk, must all be communicated to Laura by a circuitous and tedious method. In all the knowledge which is acquired by the perceptive faculties, she is of course backward; because, previous to her coming here, her perceptive faculties were probably less exercised in one week than those of common children are in one hour." And so her instruction went on. Through it all the child showed an eagerness to learn and to put herself in touch with the world that was a powerful aid to the teacher. In a few years, when Oliver Caswell, also deaf, dumb, and blind, came to the institution, Laura naturally took great interest in teaching him, and thereby profited much herself. As she approached womanhood her education was already good. She had learned to sew, to knit, and to do fancy work. She often visited her home, but her true home was the institution; there she died in her 60th year, the first case of any one so afflicted made capable of leading an industrious and happy life, and as the first case, historically the most remarkable. Popular interest in Laura Bridgman, both in this country and abroad, was naturally very great. The printed reports of her progress which were eagerly awaited were as eagerly absorbed. Distinguished foreigners coming to Boston visited her. Charles Dickens wrote in his American notes a sympathetic account of his impressions of her. The way to give liberty to the imprisoned mind had been made plain.

In the year 1887 something like the old interest was aroused by accounts of the brilliant deaf, dumb, and blind child in Alabama, Helen

Keller. This child had lost sight and hearing at 19 months as a result of a serious illness. Like Laura she kept actively interested in all that surrounded her, and like Laura she developed her own little language of signs. When she was six years old, her friends, who knew of Laura Bridgman's case, applied to Boston for a teacher. In the following year Miss Annie M. Sullivan was sent. This lady was able to put herself in touch with Helen in a very short time and in a marvelous way. In fact, she has proved herself to be a most remarkable teacher. Following in general the methods adopted in teaching Laura, Miss Sullivan began her work by putting Helen in possession of the manual alphabet. A doll was happily chosen to begin with; and with the doll on the child's lap, the teacher formed in Helen's hand the finger letters *d-o-l-l*. Other familiar objects were similarly introduced, and strange as it may seem, that which had taken three months to reach in Laura's case in Helen's took but a few days; or, in Miss Sullivan's words, "it was not more than a week before she understood that all things were thus identified." Her teacher writes: "Never did a child apply herself more joyfully to any task than did Helen to the acquisition of new words. In a few days she had mastered the manual alphabet and learned upward of 100 names." After teaching verbs and prepositions through action and position Miss Sullivan made a departure. She began to use new words in connection with old words, letting Helen understand them if possible from the context. The child adopted these words "often without inquiry." In this way she became familiar with the use of many words whose meaning never had to be explained to her.

As to the letters of the raised alphabet, Miss Sullivan writes: "Incredible as it may seem, she learned all the letters both capital and small in one day." Then came the primer; then pencil writing than which there is scarcely a more difficult exercise for the blind to learn; and yet Helen "wrote without assistance a correctly spelled and legible letter to one of her cousins; and this was only a little more than a month after her first lesson in chirography." Braille, or tangible point writing, became a constant delight to her.

Words like "perhaps" and "suppose" and those indicative of abstract ideas she learned more through association and repetition than through any explanation of her teacher. The child had the language sense largely developed. Much of the time when no one was talking with her she was reading in books printed in raised letters. Dr. Bell in trying to account for Helen's wonderful familiarity with idiomatic English, considers of great significance the statement of Miss Sullivan, that, "long before she could read them [the books] . . . she would amuse herself for hours each day in carefully passing her fingers over the words, searching for such words as she knew." In 1888, when Helen was eight years old her teacher took her to South Boston, where she could have the advantage of all the appliances and embossed books that a school for the blind affords. Thenceforth an account of her progress reads like a romance. It was no more difficult for her to learn a new word in German or in Greek than in English; and she took great delight in picking up and using French or Greek phrases.

DEFENDANT — DEFENDER OF THE FAITH

And when later she came to study these languages, she seemed to advance without effort in the knowledge of them. The educators of the deaf, who have good reason to comprehend the exceeding difficulty of teaching their pupils to articulate intelligibly, feel that Helen Keller's rapid mastery of speech is by all odds her most wonderful achievement. After she had been in South Boston some little time she heard of a Swedish girl afflicted like herself, who had learned to speak, and she said, "I must learn to speak." Miss Sullivan took her to Miss Sarah Fuller, principal of the Horace Mann School for the Deaf, and though Helen's only means of learning the position of the vocal organs in speech was to put her fingers on the lips, tongue, teeth, and throat of the speaker, she learned in 10 lessons to articulate so well that she could carry on an intelligible and audible conversation, having communication addressed to her spelled into her hand by the manual alphabet. She has learned since that time to read from the lips and throat of a speaker by placing her fingers lightly on them; so that any one sitting near her can converse with her just as though she could both hear and see. She spent a winter at the Wright-Humason Private School for the Deaf, where she improved her articulation. When Helen was 16 years old she entered the Cambridge School for Girls, Miss Sullivan accompanying her. There, under the guidance of Mr. Arthur Gilman, the director of the school, she took the course preparatory to entering Radcliffe College. At the end of one year she took the regular required examinations in the history of Greece and Rome, in English, in Latin, in elementary French, in elementary German, and in advanced German. As the questions and other matter were read into her hand by Mr. Gilman himself, Helen wrote her answers and translations on an ordinary typewriter. She passed the tests in every subject, taking "honors" in English and German. Mr. Gilman writes: "I think that I may say that no candidate in Harvard or Radcliffe College was graded higher than Helen in English." There are still other children afflicted like Helen who are doing splendid work, but, "taking this child all in all," says Dr. Job Williams, principal of the American School for the Deaf at Hartford, "and making due allowance for every possible aid that has been given her, and for all unconscious exaggeration due to friendly admiration, there yet remains so much that is marvelous as to place her beyond comparison with any other child of whom we have ever heard. The whole history of literature reveals nothing equal to her language productions from one of her years, even among those possessed of all their faculties. She is a genius, a prodigy, a phenomenon." The other deaf-blind children under instruction are some at schools for the blind, some at schools for the deaf. They must always have a special teacher, and use embossed books and adapted appliances. All are being taught on principles used in teaching Helen. In South Boston, where there are several, they attend classes with other pupils, the special teacher acting simply as interpreter and companion. See BLIND, EDUCATION OF; BRAILLE, LOUIS; FEEBLE-MINDED; HOWE, SAMUEL GRIDLEY.

EDWARD ELLIS ALLEN,

Principal of the Pennsylvania Institution for the Instruction of the Blind.

Defence of Poesie, The. The title given to Sir Philip Sidney's 'Apologie for Poetrie' when printed for the second time in the third edition of the 'Arcadia' in 1598.

Defendant, in law, the party against whom a complaint, demand, or charge is brought, in a civil or criminal proceeding; one who is summoned into court, and defends, denies, or opposes the demand or charge, and maintains his own right. The term is applied even if the party admits the claim.

Defender of the Faith (*defensor fidei*), the title bestowed on Henry VIII. of England by Pope Leo X. (1521) in recognition of the monarch's great service to the Roman Catholic Church in writing his *Assertio Septem Sacramentorum adversus Martinum Lutherum* (vindication of the seven sacraments against Martin Luther). Pallavicini, in his history of the Council of Trent, describes the great satisfaction given to the papal court by King Henry's book and the modes suggested by various cardinals of acknowledging the obligation to the monarch. The Pope, with the aid of his secretary, Sadolet, had a form of bull drawn up conferring on Henry the title "Defender of the Faith." So that he might be on a par in the matter of titles relating to religion with the king of Spain's "Catholic majesty" and the king of France's "most Christian majesty," Henry was to be "Defender of the Faith." The draft of the bull was read to the college of cardinals and one of them suggested that the fittest title for the king of England would be "Orthodox King" or "Orthodox Majesty"; another proposed "Apostolic King"; a third "Angelic King." But Wolsey had already

signified to the court of Rome his royal master's choice of the title *Defensor Fidei* and accordingly that was adopted.

Defenders, a Roman Catholic association in Ireland (1784-98), the opponents of the Peep o' Day Boys.

Defensor Matrimonii, or **Defensor Vinculi Matrimonialis**, Defender of the Marriage Tie, an official in every episcopal jurisdiction of the Roman Catholic Church, whose duty it is in all cases of petitions or suits for judicial separation of married couples or for annulment on whatever ground of marriage contracts or of the marriage relation, to defend with all his power the validity of the contract and resist its abrogation. The Defensor is required to be in person present at every stage of the trial of a matrimonial cause, and he must have access to all the records and all the testimony. Not only may he, in case the court decides for the nullity of the marriage, appeal to a court of second instance; he is under obligation to appeal every single case; and if he demands it, he must be allowed a further appeal to the highest court. Nor is that all; he has the right, and it is his duty, to open the case anew if he finds there was any serious flaw in the judgment of nullity. In short, a matrimonial cause involving nullity of a consummated marriage contract is in the Church of Rome never finally and absolutely determined so long as either of the two parties to the suit is living.

Deffand, Marie de Vichy-Chamrond, mārē dē vē-shē-shān-rōn dēf-fān, MARQUISE DU, French letter writer: b. Château de Chamrond, France, 1697; d. Paris 24 Sept. 1780. Her acquirements were very considerable, but no care seems to have been taken to regulate her temper and disposition, which were marked by a high degree of selfishness, conspicuous throughout her life. In 1718 she married the Marquis du Deffand, from whom she separated after 10 years. During the latter part of her long life she became the centre of a literary coterie, which included some of the greatest geniuses of the age. Among women remarkable for their wit and talents in the 18th century Madame du Deffand claims a distinguished place, though she left no monument of her abilities except her epistolary correspondence, highly praised by D'Alembert as affording a model of style in that species of composition. During the last 30 years of her life she was blind. In 1810 was published 'Correspondence inédite de Madame du Deffand, avec D'Alembert, Montesquieu, le Président Hénault, la Duchesse du Maine; Mesdames de Choiseul, de Staël; le Marquis d'Argens, le Chevalier d'Aydie, etc.' Her letters to the celebrated Horace Walpole have likewise been printed.

Defiance, Ohio, city, county-seat of Defiance County; on the Maumee River, the Wabash, and the Baltimore & Ohio R. R.'s, and the Cincinnati and Toledo canal; 50 miles south of Toledo. It is a trade centre and has woolen-mills, bicycle factories, machine and carriage shops, a national bank, daily and weekly newspapers. Pop. 7,650.

Defiance College, a coeducational (non-sect.) institution in Defiance, Ohio; founded in 1884; reported at the end of 1902: Professors and instructors, 10; students, 125; volumes in the library, 3,000; grounds and buildings valued at

\$20,000; benefactions, \$500; income, \$2,500; number of graduates, 160; president, W. McReynolds.

Defila'ding, in military strategics, that branch of the science of fortification, the object of which is to determine, when the intended work would be commanded by eminences within range, the directions or heights of the lines of rampart or parapet, so that the interior of the work may not be incommoded by a fire directed to it from such heights.

Defile, in military language, is a narrow way, admitting only a few persons abreast. Hence to march before any one with a narrow front, in column or by files, is called defiling.

Definite Proportions, Laws of. See ATOMIC THEORY.

Definition (from the Latin *definitio*) of a thing signifies, in lexicography, a concise account of its essential and characteristic points. A definition should embrace all the essential properties of the object intended to be defined, and not admit any which do not belong to it, which is often extremely difficult, on account of the shades and gradations by which different things are blended. The most simple things are the least capable of definition, from the difficulty of finding terms more simple and intelligible than the one to be defined. According to the old scholastic logic, a definition must give the mark of the genus (*nota generalis seu genus*) and of the species (*nota specialis seu differentia specifica*); for instance, a barn is a building (*nota generalis*) for the purpose of preserving corn, etc., (*nota specialis*). According to Aristotle every strict definition could be divided into two distinct parts; one dealing with the genus, and the other declaring the specific difference by which the given subject varies from others of the same order. Kant and his followers on the contrary make definition merely a list of essential marks summed up without any distinction between genus and difference.

In *optics* definition means the defining power of a lens—the giving of a clear and distinct image of an object together with all details of importance.

Defoe, Daniel, English writer: b. London 1661; d. there, 20 April 1731. His father, whose name was James Foe, carried on the trade of a butcher. In 1685 he joined the insurrection of the Duke of Monmouth, and had the good fortune to escape to London, where he went into business, but was unsuccessful. He subsequently obtained an appointment under government, which he held from 1695 to 1699, and afterward engaged in various mercantile speculations. His business misfortunes, however, caused him to turn his attention to literature. In 1697 he wrote an 'Essay on Projects.' In 1701 appeared his satire 'The True-born Englishman,' designed to show the folly of the popular objection to King William, as a foreigner, by a people who were themselves a mixture of so many races. In 1702, when the High Church party seemed disposed to carry matters strongly against the Dissenters, he published 'The Shortest Way with the Dissenters,' an ironical recommendation of persecution, so gravely covered that many persons were deceived by it. It was, however, voted a

sedition libel by the House of Commons, 25 Feb. 1703; and the author avowing himself, to secure his printer and publisher, was prosecuted and sentenced to fine, imprisonment, and the pillory. He underwent the latter punishment with great equanimity, and was so far from being ashamed of it that he wrote a 'Hymn to the Pillory,' alluding to this circumstance. In February 1704, while in Newgate, he commenced the 'Review,' a sort of newspaper containing papers of literary and political criticism, supposed to be discussed by a scandal club. This paper was continued for nine years, and was entirely conducted by Defoe, even during protracted absences from England, in one of which, in 1710-11, he edited 45 numbers of the Edinburgh 'Courant.' In 1705 he wrote a short account of 'The Apparition of Mrs. Veal,' intended, it is said, to create an increased demand for a popular translation of Drelincourt on Death. This story, like others by Defoe, though told with great circumstantiality and appearance of good faith, is entirely fictitious. In 1706 he published his largest poem, entitled 'Jure Divino,' a satire on the doctrine of divine right. When the accession of the House of Hanover became an interesting topic he wrote in its favor, but so obtuse was the public to his irony that he was imprisoned for his productions as libels in favor of the Pretender. In 1715 he published 'The Family Instructor,' a work inculcating moral and religious duties in a lively manner, by narrative and dialogue. To this his well-known 'Religious Courtship' (1722) formed a third volume. In 1719 appeared the most popular of all his performances, 'The Life and Surprising Adventures of Robinson Crusoe,' the favorable reception of which was immediate and universal. The success of Defoe in this induced him to write a number of other lives and adventures in character; as 'Moll Flanders'; 'Captain Singleton'; 'Roxana'; 'Duncan Campbell'; and 'The Memoirs of a Cavalier,' pronounced by the Earl of Chatham the best history of the civil war extant. In 1722 he published a Journal of the Plague in 1665, in the person of a citizen supposed to have been a witness of it. In 1724 he published the 'Great Law of Subordination,' and in 1726 his 'Political History of the Devil,' to which he afterward added, in the same style of reasoning, wit, and ridicule, a 'System of Magic.' He is also author of a 'Tour through the Island of Great Britain'; 'The Complete English Tradesman, a Plan of English Commerce,' etc. See Wilson, 'Memoirs of the Life and Times of Daniel Defoe' (1830); Lee, 'Newly Discovered Writings of Defoe, with Life' (1869); Minto, 'Defoe' (1879); Wright, 'Life of Defoe' (1894).

De Fon'taine, Felix, American journalist: b. Boston, Mass., 1832; d. Columbus, S. C., 11 Dec. 1896. The first statement given to the North of the attack on Fort Sumter, was written by him; and he was correspondent of the *Charleston Courier* from the principal battlefields during the Civil War. Subsequently he went to New York, and was connected with the *Herald* much of the time until his death. He was the author of 'Cyclopædia of the Best Thoughts of Charles Dickens'; 'Gleanings from a Confederate Army Note-Book'; and 'Birds of a Feather Flock Together.'

Vol. 6—10

De For'est, John William, American novelist: b. Humphreysville, Conn., 31 March 1826. He passed many years in independent study and foreign travel, becoming a proficient in several languages; entered the army as captain at the outbreak of the Civil War, and rose to major; and since 1850 has been a fertile writer of essays, short stories, and novels for the leading magazines, taking prominent rank among American novelists. Among his works are: 'History of the Indians of Connecticut' (1853); 'Oriental Acquaintance' (1856); 'Witching Times' (1856); 'European Acquaintance' (1858); 'Seacliff' (1859); 'Miss Ravenel's Conversion' (1867); 'Overland' (1871); 'Kate Beaumont' (1872); 'The Wetherell Affair' (1873); 'Honest John Vane' (1875); 'Justine Vane' (1875); 'Playing the Mischief' (1876); 'Irene Vane' (1877); 'Irene, the Missionary' (1879); 'The Oddest of Courtships; or, The Bloody Chasm' (1881); 'A Lover's Revolt' (1898); 'Overland' (1899); 'The De Forests of Avesnes and New Netherland' (1900).

Deformities. In medicine deformities are deviations from the normal development of some part or parts of the body. These may mar the appearance from the æsthetic standpoint, or they may be internal or unknown, resulting in serious disturbance of health, or having no influence on the life processes whatever. Deformities may be congenital or acquired, in the former case usually being the result of defective development, in the second to some disease process. A number of forms of defective development result in the production of monsters (q.v.). Special characteristic deformities are harelip, congenital dislocation of the hip, web-fingers, supernumerary fingers, club-hands, congenital club-foot, bow-legs, knock-knees, and various minor anomalies. The commonest forms of acquired deformities are usually due to some disease of the nervous system, as acute spinal paralysis, acute anterior poliomyelitis of children. This latter causes paralyzes of the arms or legs, which result in deformities from insufficient growth. Hemorrhage of the brain frequently occurring during childbirth may result in hemiplegia in the infant, with consequent deformities. Rachitis or rickets frequently induces deformities. Other forms of acquired deformity are hammer-toe and acquired club-foot, the latter usually resulting from paralysis.

Defregger, Franz, fränts dā-fräg-ër, German genre painter: b. Stronach 30 April 1835. The subjects of almost all his pictures are drawn from the Tyrolese peasant life, his few religious pictures having been in the main unsuccessful.

De Fu'niak Springs, Fla., town, county-seat of Walton County; situated on the Louisville & Nashville R.R., 80 miles northeast of Pensacola, and about 25 miles north of the Gulf of Mexico. The industries of the place are those of an agricultural and fruit-growing country. It is the site of a State Normal School, and the Florida Chautauqua. Its population increased nearly threefold between 1890 and 1900. Pop. (1900) 1,661.

De Gar'mo, Charles, American educator: b. Wisconsin 7 Jan. 1849. He was graduated from the State Normal University of Illinois in 1873, was principal of public schools, Naples, Ill., 1873-6; professor of modern languages at

DEGAS — DEGENERATION AS A FACTOR IN EVOLUTION

the State Normal University 1886-90; and president of the Swarthmore College 1891-8. Since 1898 he has been professor of the science and art of education at Cornell University. He has published: 'Essentials of Method'; 'Herbart and Herbartians'; 'Language Lessons.'

Degas, dè-gā, Edgar Hilaire Germain, zhār-mān, French painter and engraver: b. Paris 19 July 1834. He was a pupil of La Mothe, and studied at the Beaux Arts in Paris. He is one of the most interesting members of the impressionist school, having worked in pastel, etching, dry point, and stone-engraving, producing numerous interiors of theatres, and café-concerts, foyers of the opera, views of the circus and of laundries, studies of dancers, etc., and all with a masterly touch. He also produced several portraits of Manet.

Degeneracy, a term much in vogue at the present time to indicate certain physical and mental peculiarities found in some individuals who are unable to keep up in the struggle for existence according to more ethical and honest methods. That abnormalities in ethical and mental development are apt to be associated with abnormalities in the human frame, is the central assumption on which this hypothesis rests, and in recent years the school of Lombroso in Italy, and its followers elsewhere, have developed a very one-sided series of studies on this general thesis. Thus the argument would read that, given 100 epileptics, it will be found that they show a very high percentage of physical anomalies in the way of variations in the configuration of the ear, modifications of the so-called normal palate, differences in the lengths of the arms and legs, changes in the color of the iris, and other physical anomalies. Like inferences are drawn from the study of idiots, defectives, the insane and criminal classes, and an entirely new school of criminology has been based upon the anthropometric rules of Lombroso. In the present discussion the word degeneracy is restricted to include only certain border-line conditions. In cases of frank idiocy, epilepsy, and insanity, sufficiently comprehensive terms are at hand to describe the conditions, whereas the term degeneracy is by modern students best reserved for those individuals in whom the ethical and moral developments show a non-normal character. It is therefore in the fields of criminology and abnormal psychology that the term has its deepest and widest application. The relationship of genius to degeneracy is much played upon by superficial writers. The term is an unfortunate one in large measure, as it offers an easy and convenient means of designation for a large and unsorted group of phenomena that are very imperfectly understood even by the most searching scholars.

Degeneration (in Pathology). In medical pathology degeneration is one of the processes that occur in the cells of an organ whereby different grades of disintegration and shrinking take place. It is one of the retrograde or breaking-down processes in contrast to those of abnormal growth and increase, although in many of the degenerations both processes are going on side by side. When abnormal intracellular metabolism slowly converts the cell plasma into useless and abnormal substances the process is known as degeneration, and then following upon such degenerations there usually results a par-

tial or complete death of the plasma, leading to the destruction of the cell. In large measure, according to the character of the substances produced in the degenerative processes, various forms of degeneration are known. If in the organs there is a deposit of a waxy or lardy substance derived from the serum of the blood, the degeneration is known as amyloid degeneration. This is very frequently found in several organs at the same time, and results in large part from the infectious diseases accompanied by nutritional disturbances. Thus, in connection with chronic tuberculosis, syphilis, and chronic dysentery, amyloid degeneration is apt to occur. Hyaline degeneration is another form, which takes place in the connective tissue by which that type of cell is rendered homogeneous. Hyaline degeneration commonly occurs in the arteries and heart-valves, and is frequently associated with chalky infiltrations in these structures. Colloid degeneration occurs in certain forms of cancer in which the substance in the cells resembles softened glue. Mucous degeneration consists in the transformation of the leading tissues into a transparent, viscid, homogeneous mass consisting of mucins and pseudomucins. Mucoïd degeneration takes place largely in the connective tissue in the epithelial cells, and sometimes as a result of the disturbance of the functions of the thyroid gland as in myxædema. Fatty degeneration is a degeneration in which fat globules are deposited in the cells. Albuminous degeneration, or cloudy swelling, as it is sometimes called, consists in a fine granulation of a number of cells in the body, particularly in the kidneys, liver, and brain. This acute degeneration is very frequently associated with fatty degeneration, and is due in great part to anomalies of nutrition largely produced by bacteriological agencies, as in the infectious diseases, and also at times to auto-intoxic products having their origin within the body itself as a result of perverted oxidation. Pigmentary degeneration is another form, in which are deposited in the cells small or large quantities of iron compounds derived largely from the blood and known as pigments. Consult: Hektoen, 'Text-book of Pathology.'

Degeneration, a work of Max Nordau (1895), which aimed at a scientific criticism of those degenerates not upon the acknowledged lists of the criminal classes. "Degenerates," asserted Nordau, "are not always criminals, prostitutes, anarchists, and pronounced lunatics; they are often authors and artists. These, however, manifest the same mental characteristics, and for the most part the same somatic features, as the members of the above-mentioned anthropological family, who satisfy their unhealthy impulses with the knife of the assassin or the bomb of the dynamiter, instead of with pen and pencil. . . . Now I have undertaken the work of investigating the tendencies of the fashions in art and literature; of proving that they have their source in the degeneracy of their authors, and that the enthusiasm of their admirers is for manifestations of more or less pronounced moral insanity and dementia."

Degeneration as a Factor in Evolution. Degeneration, in biology, is a term used to describe those not unfrequent cases where an entire organism falls below the structural level of its young stages, or where an organ in the

same way loses its fullness of function, and becomes more or less atrophied, abortive, and simplified. Thus many parasitic worms, crustaceans, etc., are emphatically simpler than their free-swimming larvæ, and the sessile adult ascidian shows only traces of the vertebrate characters which are plain enough in the active young. Thus too, a crustacean which starts with a well-developed eye, may exhibit the gradual loss of this on assuming a dark habitat. The term is best confined to cases where a level of structure exhibited during early life is more or less lost in the adult. Degeneration must be distinguished (1) from occasional abortion; (2) from reversion to an ancestral type; and (3) from the occurrence of rudimentary and undeveloped organs where a character possessed by ancestral types remains more or less undeveloped, or shows itself only in embryonic life. Degeneration may be due to the environment, or to cessation of function, or to some more subtle constitutional cause. Absence of food, heat, light, etc., may mean the absence of the necessary stimulus for the growth and maintenance of the organs; or superfluity of food may cause one system to preponderate over others. Nor can it be doubted that cessation of function checks the food-supply to a given organ, and in other ways helps to bring about its degeneration. But on the other hand, some less obvious cause — the fatigue of early life, a constitutional sluggishness, etc., may share in conditioning degeneration, as in the case of the majority of the *Tunicata*. Weismann and others, however, would explain degeneration by what they call the non-operation of natural selection. On this view, organs are not only developed but maintained by natural selection; and if it happen that an organ is no longer an advantage in this struggle for existence (for example, eyes in dark caves), then natural selection no longer maintains that organ, and it disappears in the course of generations. Weismann applies this ultra-Darwinian conception especially to cases which might be called non-development rather than actual degeneration — for example, to the slightly developed wings of the *Apteryx*. Most cases of degeneration properly so called appear hardly to require his subtle explanation, but find a sufficient one in the nature of the environment, in the effects of stopped function, and in the constitution of the organism. The theory of the degeneration of man from a high state has been superseded by the belief in a development from low savagery (see ANTHROPOLOGY; ARCHÆOLOGY). Consult: Lankester, 'Degeneration'; Weismann, 'Ueber den Rückschritt in der Natur'; Nordau, 'Degeneration.' See also ENVIRONMENT; EVOLUTION, etc.

Deger, dā-gēr, Ernst, German painter: b. Bockenem, Hanover, 15 April 1809; d. Düsseldorf 27 Jan. 1885. He was a pupil of Wach and Schadow, in Berlin and Düsseldorf, becoming a painter in oil and of frescoes, and giving much attention to the latter form of work. He decorated the chapel at Castle Stolzenfels for Frederick William IV. of Prussia, becoming in 1869 professor at the Düsseldorf Academy and member of the Berlin and Munich academies. Among his works are: 'Pieta' (1830); 'Bearing the Cross' (1832); 'Annunciation' (1834); 'Virgin Adoring Christ' (1836); 'Madonnas and Seven Scenes from the Life of Christ'

(1841-51), in St. Apollinaris' Chapel, Remagen; 'Adam and Eve' (1853), Raczynski Gallery, Berlin. His works are noted for vigor and finish. He was a leader of the so-called "Nazarean School."

De Gérando, Joseph Marie, zhō-zěf mā-rē dē zhā-rañ-dō, BARON, French philosopher and statesman: b. Lyons 29 Feb. 1772; d. Paris November 1842. On the siege of Lyons in 1793 he took up arms in its defense, and greatly distinguished himself by his bravery, but was subsequently obliged to flee. He returned to France on the proclamation of an amnesty, and joined a cavalry regiment. While in garrison at Colmar he composed an essay on the theme proposed by the French Institute, 'Quelle est l'Influence des Signes sur l'Art de Penser?' and gained the prize. In 1799 he took office under Lucien Bonaparte as minister of the interior, and became secretary-general of that department in 1804. In 1811 he was made a councillor of state, and in 1812 governor of Catalonia. In 1819 he commenced a course of lectures in the Faculté de Droit, in Paris, on public and administrative law, suspended in 1822, and resumed in 1828. He was raised to the peerage in 1837. De Gérando acquired great fame by his philosophical writings, in which he follows with some deviations the school of Condillac. His principal works are: 'Des Signes et de L'Art de Penser considérés dans leur Rapports Mutuels' (1800), an enlargement of the dissertation formerly written for the French Institute; 'De la Génération des Connaissances Humaines' (1802); 'Histoire comparée des Systèmes de Philosophie' (1804), completed after his death; 'Du perfectionnement Moral et de l'Education de Soi-même,' a treatise which gained the prize of the French Academy in 1825; 'De l'Education des Sourds-muets de Naissance' (1827); 'Institutes du Droit administratif Français, ou Eléments du Code administratif réunis et mis en ordre' (1829-45); 'De la Bienfaisance Publique' (1839).

Deggendorf, dēg'gēn-dōrf, Germany, a town of Lower Bavaria, near the Danube, 39 miles northwest of Passau. It has manufactures of paper, linen, woollens, stoneware, and matches. Its Church of the Holy Sepulchre is visited annually by a large number of pilgrims. Pop. (1900) 6,843.

Deglutition, the physiological act of swallowing, or the process by which food is conveyed to the stomach.

Degradation of clerics in the Roman Catholic Church has two degrees, being either "verbal" or "actual." By "actual" degradation the offender, besides being deposed from the ministry, is deprived of his order and of the canonical privileges attached to his order, and in particular is delivered over to the secular arm for punishment; nor does any one who makes a violent assault on him incur the excommunication decreed against whoever violently attacks a cleric or a monk. By "verbal" degradation the cleric is deprived of all his clerical functions and stripped of his Church benefice if he holds any; but he retains the privileges of his order, and is not handed over to the secular power: he has right of appeal to ecclesiastical courts. If his offense merits imprisonment he must be shut up in some monastery or other ecclesiastical establishment; and though he is degraded, still were one to make

an assault on him the assailant would, *ipso facto*, incur excommunication. Nevertheless, since the sacrament of order imprints an indelible character, the degraded cleric, whether by actual or verbal degradation, is still priest or deacon or whatever he was before in the ministry; and his purely sacerdotal and sacramental acts, even his priestly absolution, if given *in articulo mortis* or in grave peril of death when no priest in full Church communion is at hand, is valid. So, too, his celebration of the mass is valid though sacrilegious.

The process of actual degradation is as follows: The culprit, in the attire of his order and bearing in his hands some instrument of his clerical functions, a chalice or a mass-book, is brought before the bishop. That emblem of his priestly state is taken away from him; then he is stripped of his ecclesiastical attire, and his head is shaven to obliterate the mark of the clerical tonsure. Finally the bishop addresses him in these words: "By the authority of God Almighty . . . we take away from thee the clerical habit and depose, degrade, and deprive thee of all order, benefice, and clerical privilege."

De Grasse, Comte. See GRASSE, COMTE DE.

Degree, in universities, a title and badge, accompanied with a certificate, conferred on the student, after examination, as a testimony of his proficiency in certain branches of knowledge, and entitling him to certain privileges. Some degrees are conferred, without previous examination, in general recognition of the graduate's eminence in the literary, philosophical, or scientific world. These are called honorary degrees. The degrees are much the same in all universities; but the regulations regarding them, and the previous discipline or studies, differ. The original degrees are bachelor, master, and doctor, to which many modifying characters are added, according to the faculties of arts, law, divinity, medicine, science, literature, etc., in which each degree is taken.

In music, a step ascending or descending the tone-ladder. It may consist of a semi-tone, a tone, or (in the minor scale) of an augmented tone. When the notes are on the same line or in the same space, they are of the same degree. The interval of a second is one degree, the interval of a third two degrees, and so on, irrespective of the steps being tones or semi-tones. Hence, also, notes are in the same degree whether they are natural, flat, or sharp, of the same note, as C and C sharp, E and E flat; and they are in different degrees when, though the same note on an instrument of fixed intonation, they are called by different names, as F sharp and G flat, C sharp and D flat.

In mathematics, a unit in a scale of measurement; specifically, in algebra, the amount reached by adding together the exponents of the facient or variables contained in any single term of an equation or expression; and in trigonometry, the unit of measurement for circles, or the angles they subtend.

Degree. See ANGLE; CIRCLE.

Degrees of Latitude and Longitude.

Degree of latitude is the space or distance on the meridian through which an observer must move to vary his latitude by 1° , or to increase or diminish the distance of a star from the

zenith by 1° ; and which, on the supposition of the perfect sphericity of the earth, is the 360th part of the meridian.

Degree of longitude is the space between the two meridians that make an angle of 1° with each other at the poles, the quantity or length of which is variable, according to the latitude.

Degrees, Measurement of. After Newton had taught that the earth, on account of its motion round its axis, must be highest near the equator, and that the diameter of the equator must be longer, by one 230th part, than the diameter from pole to pole, the French wished to investigate the subject further by actual measurement. The measurement was begun with the result that the axis of the poles was found to be longer than a diameter of the equator, and that the earth was, in form, more like a lemon than an orange. For 40 years disputes were maintained on this point without settling the question; and at last the Academy of Sciences resolved, on the proposition of Condamine, to have a degree measured at the equator (the expedition went to South America in 1735), and one in Lapland (Kittis and Tornea being the extreme stations to which the expedition was sent in 1736). It was found that the northern degree was greater than that under the equator, and that Newton's conjecture was right. But the question still remained, How great is the flattening of our planet? The theory said one 230th part, if the earth had been in a perfectly liquid state when it began its rotation. The calculations, however, always gave different results, varying according to the different measurements adopted as the basis of them; for measurements had been made, not only in America and Lapland, but also in France, England, Hungary, and Italy. When the French established their new and admirable system of measures and weights upon the basis of the metre, which was to be the ten millionth part of the distance from the equator to the pole (3.2808992 English feet, or 39.37 inches), it was necessary to know with accuracy the circumference and the flattening of the earth. A measurement, therefore, took place in France, not of one degree, but of 10 degrees, from Dunkirk to Formentera, one of the Balearic Islands. In Sweden in 1802 the degree, which 80 years before had been measured by Maupertuis, was now measured again with better instruments, and thus the circumference and flattening of the earth were pretty well ascertained. After the Peace of Amiens the measurements of degrees just made in England, under Gen. Roy, by Lieut.-Col. Mudge, were connected with those in France; and thus an arc of 20 degrees, from the Balearic Islands over France and England, to the Orkneys, was measured, and the flattening of the earth calculated to be 1-304th (the most recent estimate being 1-292). In India, the measurement of a degree, begun by Lambton, was continued by Everest and completed by Walker. The measurement of an arc of $25^{\circ} 20'$ from Hammerfest to Ismailia was completed in 1855. Similar measurements have been continued to the present time, and at the Geodetic Congress in London in 1900, it was announced that English experts were engaged in measuring an arc of the meridian of 104° from Cape Colony to Alexandria, and had made considerable progress.

The annexed table shows the lengths of a degree of longitude for places at every degree of latitude from 0° to 90°. It is computed on the supposition that the earth is a sphere.

Deg. lat.	Eng. miles	Deg. lat.	Eng. miles	Deg. lat.	Eng. miles
0	69.07	31	59.13	61	33.45
1	69.06	32	58.51	62	32.40

Measurement of a Degree of Longitude.—The degrees of longitude are largest under the equator, and diminish continually toward the pole. Under the equator a degree of longitude contains 60 geographical, 69.16 statute miles. If the form of the earth is not entirely regular, the degrees of longitude on the same parallel of latitude cannot all be of the same length; and it has been proposed to investigate this by actual measurement. This task is, in the trigonometric part, as easy as the measurement of a degree of latitude; but in the astronomical part it is 15 times more difficult. The difference of the longitude of two places is determined by the difference of the hour of the day at the same point of time in the two; as a place situated 15 degrees to the east of another has noon a whole hour earlier. One hour, therefore, corresponds to 15 degrees, or 1,042½ statute miles, under the equator, or 5,504,400 feet; a minute of time to 91,740 feet, and a second of time to 1,529 feet. A mistake of a second of time, therefore, in calculating the longitude of two places, makes a corresponding error in space. To determine time within two or three seconds, by means of rockets, at a distance of 1,042½ miles is impossible; and while the measurement of an arc corresponding to this distance trigonometrically, may be attended with an error to the amount of 200 feet, an astronomical measurement would leave an uncertainty of 2,000 feet. The earlier measurements of the French were directed, in the north, by Maupertuis; in the south by Bouguer. Since that time measurements have been made in all the great continents of the globe—in Pennsylvania, in the time of Maskelyne, by Mason and Dixon; at the Cape of Good Hope by Lacaille, completed by Maclear; in Prussia by Bessel; in Russia by Struve; in Denmark by

Schumacher; and in England by Roy Kater, and Colby. The French arc from Formentara to Dunkirk was measured by Mechain and Delambre. The results of the measurements, as given by Airy, make the equatorial diameter 7925.648, and the polar diameter 7899.170 miles. Bessel's results are almost identical, namely, equatorial diameter 7925.604, and polar diameter 7899.114 miles. There is an international association, having as its main object the correlation of all degree measurements and connected data with the view of accurately ascertaining the figure of the earth.

De Haas, dé hās, Maurice Frederick Hendrick, American marine painter: b. Rotterdam 12 Dec. 1832; d. 23 Nov. 1895. He studied in England and at The Hague under Louis Meyer, and in 1857 was appointed painter to the Dutch navy. In 1859 he came to the United States and opened a studio in New York which remained his home henceforth. Among his paintings are: 'Admiral Farragut's Fleet passing New Orleans'; 'Coast of France'; 'Sunset at Sea'; 'Moonlight at Sea'; 'Sunset at Pigeon Cove'; 'Sunrise in a Fog at Newport'; 'Shipwreck'; 'Menhaden Boats off Long Island'; and 'Off Marblehead.'

De Haven, Edwin J., American naval officer and explorer: b. Philadelphia 1819; d. there 2 Oct. 1865. He entered the navy in his 10th year and resigned in 1857. He commanded the expedition which left New York in 1850 to search for Sir John Franklin.

Dehorning, the act or practice of depriving animals, specifically cattle, of their horns. Clippers or shears have been invented for the operation, wherewith it is performed quickly and with comparatively little pain, and scarcely any disturbance of the animal's normal functions or condition. The most favorable conditions of weather, etc., should be chosen for it, and the aid of a skilful operator is desirable. When all features of cruelty or unnecessary pain are avoided, there is believed to be much to justify the practice of dehorning, inasmuch as it tends, among other benefits, to convenience, safety, and comfort in the handling of cattle, especially during their transportation from place to place.

Dehra Dun, dēh'rā doon. 1. A district in the Northwest Provinces, British India. It lies at the base of the Himalayas. Good roads, cultivated fields, hedges, streams flowing through meadows all, in parts of this district, look like some of the old country districts of the well-cultivated parts of Europe. The area is 1,193 square miles; pop. 170,252. 2. Dehra is the name of the chief town or capital of the district. It has an English garrison and contains a number of European inhabitants. Pop. 27,813.

Dei Gratia, dē-i grā'shī-a (Lat. "by the grace of God"), a formula which many European sovereigns add to their title, and which is taken from an expression of the apostle Paul in the New Testament. It was first used by the clergy in the time of Constantine the Great, as an expression of dependence upon the grace of God; and afterward the higher clergy came to use along with it the addition *et apostolica sedis* (by the grace of God and the apostolic see). In the time of the Carolingian race the secular princes also assumed it; and in course of time it came to be regarded as asserting something

like the divine right of kings and their independence of any earthly power. The expression has been made use of on the coins of many nations.

Deiamba, *dā-yām'ba*, Congo tobacco, a plant growing wild in the marshy districts of Congo, Africa, the flowers of which produce a narcotic effect when smoked.

Deianira. See *DEJANIRA*.

Deidamia (*Deidameia*), daughter of Lycomedes: she bore Pyrrhus and Oneirus to Achilles, during his abode at Scyros.

Deiler, John Hanno, American educator: b. Altoetting, Upper Bavaria, Germany, 8 Aug. 1849. He was graduated at the Royal Normal College, Freising, and studied at the Royal Polytechnic Institute, Munich. He taught in the public schools of Munich until 1871, and was principal of a German school in New Orleans 1872-9. He has been professor of German in the University of Louisiana and Tulane University since 1879. He has been connected with various German societies in New Orleans, and has published 'Das Redemptions-System im Staat Louisiana'; 'Geschichte der Deutschen Kirchengemeinden im Staat Louisiana'; 'Geschichte der Einwanderung von 1820-1896'; 'Deutschen Gesellschaften von New Orleans'; etc.

Deimos (*dī'mōs*) and **Phobos**, the names respectively of the outer and inner satellites of Mars, discovered by Prof. Asaph Hall in the summer of 1877, with the 26-inch equatorial of the Washington Observatory. Deimos revolves about its primary in 30 hours and 18 minutes, while Phobos, a most extraordinary body, accomplishes its revolution in 7 hours, 39 minutes, and 14 seconds, being at a distance of only about 3,700 miles from the surface of Mars.

Deioces, *dē-i'ō-sēz*, Median king: fl. about seven centuries B.C. He rose from a private station to be the founder of the Median empire. By acting as arbitrator in the disputes which took place in his own vicinity, he had acquired a high reputation for wisdom and justice; and when the Medes, in consequence of their revolt from the Assyrians, stood in need of a sovereign, they found none whose claims to the honor seemed stronger than those of Deioces. Immediately after his election he assumed great state, surrounded himself with body-guards, and built the city of Ecbatana, in the centre of which he resided, almost wholly hidden from public view, transacting all business by deputies. His administration was vigorous, and after a peaceful reign of 35 years he was able to transmit the throne, without a contest, to his son Phraortes.

Deiotarus, *dē-i'ō'tā-rus*, Galatian tetrarch: d. 30 B.C. He received from the Roman senate the title of king of that province and Armenia Minor, on account of services rendered to the Romans in the Asiatic wars. In the civil war he joined the party of Pompey. Cæsar took from him Armenia, obliged him to march with him against Pharnaces, and left him nothing but the title of royalty. He was accused of having plotted against the life of Cæsar, from which charge Cicero defended him in an oration yet extant. After the murder of Cæsar he returned to his dominions, joined Brutus, and afterward Augustus.

Deiphobus, *dē-ī'f'ō-būs*, in Greek legend the son of Priam and Hecuba, who married

Helen after the death of Paris, but was betrayed by her to the Greeks.

Deiphon, *dē'i-fōn*, in mythology, the son of Triptolemus and Megaira, whom Ceres loved so passionately that she wanted to make him immortal, and made him pass through fire for that purpose. Being disturbed by the cries of his mother, who chanced to see the matter, the goddess in a hurry mounted her car, and left Deiphon to perish in the flames.

Deipnosophist, *dē-īp-nos'ō-fist* (from the Greek *Deipnosophistæ*, learned men at dinner), one of an ancient sect of philosophers famed for their learned conversation at meals. The work or rather compilation, 'Deipnosophistæ' of the celebrated Greek grammarian and rhetorician, Athenæus, who flourished about two centuries before Christ, has preserved to posterity thousands of quotations and names of authors to the number of 700, that otherwise would have been lost. The "learned guests" in his voluminous work numbered 29, who meet and banquet for days, entertaining one another with excerpts which Athenæus must have gathered at great pains and labor from the library of Alexandria, afterward destroyed. The titles of books he puts into the mouths of his characters alone number 2,500.

Deir el-Baheri, *dār-ēl-bāh'rē*, or **Der el-Bachri**, is a temple seat in the district of Thebes, on the west bank of the Nile, opposite Karnak, which is about five kilometres distance from it. At Der el-Bachri are some remarkable ruins of a temple built on terraces up the hillside which edges the alluvial plain. This is known as the temple of Queen Ratasu. The building is probably contemporary with those of Luxor and Karnak, being erected in the same style of magnificence.

Deir-el-komar, *kā'mār* ("convent of the moon"), a town of Syria, formerly the capital of the Druses, 13 miles south-southeast of Beyrout. It is situated on the edge of a deep and picturesque glen of Mount Lebanon, on the opposite side of which stands the palace Bteddin, the summer residence of the Christian governor of Lebanon. The town's chief industry is the making of embroideries and rich stuffs. Pop. 8,000, mostly Maronites.

Deira, *dē'i-ṛa*, an ancient Anglian kingdom stretching from the Tees to the Humber, and extending inland to the borders of the British realm of Strathclyde. With Bernicia it formed the kingdom of Northumbria. The union between Bernicia and Deira seems to have been rather unstable, for it was only under Edwin, Oswin, and other strong kings, either of Deiran or Bernician blood, that a real united Northumbria existed; and when the struggle for supremacy among the English kingdoms resulted in the triumph of Wessex, the two northern kingdoms were allotted to separate earls. Finally Deira became a kingdom under the Danes. The story seems to be authentic, that the slaves who attracted Gregory I. in the slave market of Rome, were from Deira.

Deism (Lat. *deus*, God), a philosophical system which, as opposed to Atheism (Gr. *a*, not, and *Theos*, God), recognizes a great First Cause; as opposed to Pantheism (Gr. *pan*, all, *Theos*), a Supreme Being distinct from nature or the universe; while as opposed to Theism, it

looks upon God as wholly apart from the concerns of this world. It thus implies a disbelief in revelation, as set forth in the Old and New Testaments, scepticism as regards the value of miraculous evidence, and an assumption that the existence of Deity can be proved by natural reason alone, unaided by spiritual or religious intuition. While Deism cannot be attributed to any one country or epoch, it seemed to have its fountain-head in England during the end of the 17th and first half of the 18th centuries.

Deissman, dis'män, **Adolf**, German theologian: b. Langenscheid, 7 Nov. 1866. He was educated at Tübingen and Berlin, and has been professor of New Testament exegesis and criticism at the University of Heidelberg from 1897. He has published 'Johann Kepler und die Bibel' (1894); 'Bibelstudien' (1895); 'Neue Bibelstudien' (1897); 'Theologie und Kirche' (1900).

Deist, one who admits the being of a God, but denies the existence or even necessity of a divine revelation, believing that the light of nature and reason are sufficient guides in doctrine and practice; a believer in natural religion only; a freethinker.

Etymologically the words deist and theist are the same in meaning, only deist is from Latin and theist from Greek. Conventionally, however, they are widely different in import; the term theist being applied to any believer in God, whether that believer be a Christian, a Jew, a Mohammedan, etc., or a deist properly so called. A deist is, as the definition states, one who believes in God, but disbelieves in Christianity, or more generally in revelation.

The term Deists, or Freethinkers, is usually employed to designate a series of writers who appeared in England in the 17th and 18th centuries, and sought to establish Natural Religion upon the basis of reason and free inquiry, in opposition to all positive religions, and without reference to supernatural revelation. They were critical, if not hostile, in their attitude toward Scripture.

Deistic, or **Deistical**, pertaining to deism or the deists, containing the doctrines of deism or Natural Religion.

Also a term applied to a controversy which arose in England in the 17th and 18th centuries, between those who believed and those who disbelieved in revelation; the latter, however, not occupying the atheistic standpoint, but accepting as a settled point belief in a personal God. The first, in point of time, of the celebrated English deists was Lord Herbert of Chesham, the publication of whose work, 'De Veritate,' which appeared in Paris in 1624, began the controversy. There followed, on the same side, Hobbes, Tindal, Morgan, Toland, Bolingbroke, Paine, and others. The standard work on the subject is the Rev. Dr. John Leland's 'Deistical Writers,' first published in 1754.

Dejanira, děj-a-n'ra, in Greek mythology, a daughter of Æneus, king of Ætolia. Her father promised to give her in marriage to him only who proved to be the strongest of all his competitors. Hercules obtained the prize, and married Dejanira, by whom he had three children. When Nessus, a centaur, who had offered violence to Dejanira, was dying by a poisoned arrow shot from the bow of Hercules, she accepted from him the present of his tunic, which Nessus said had the power of reclaiming a

husband from unlawful loves. Accordingly, when Hercules became enamored of Iola, daughter of the king of Echalía, she sent him the centaur's tunic, which instantly caused his death. Dejanira was so disconsolate at this event that she destroyed herself.

Déjazet, dā-zhā-zā, **Pauline Virginie**, French actress: b. Paris 30 Aug. 1797; d. 1 Dec. 1875. On the stage before she was five years old, she grew up playing children's and boys' roles with marvelous precocity of intelligence and grace. In 1821 she began to play at the Gymnase, but her greatest triumphs were won at the Théâtre du Palais-Royal, whither she betook herself in 1834. She left the boards in 1868, and the next year received a pension of 2,000 francs. See 'Lives,' by Lecomte (1866), Duval (1876).

De Kalb, Johann, yō'hän də kälb, French soldier: b. Huttendorf, Bavaria, 29 June 1721; d. Camden, S. C., 19 Aug. 1780. He was educated in the art of war in the French army. In 1762 he visited the Anglo-American colonies as a secret agent of the French government. He was a brigadier in the French service, when, 7 Nov. 1776, he made with Franklin and Silas Deane an engagement to serve in the forces of the revolted colonies; and in 1777 he accompanied Lafayette to America. Congress appointed him a major-general 15 Sept. 1777, after which he joined the main army under Washington, and was active in the events near Philadelphia, which preceded the encampment at Valley Forge. He served in New Jersey and Maryland till, in April 1780, he was sent to reinforce Gen. Lincoln, then besieged in Charleston. He was second in command under Gen. Gates; and in the disastrous battle of Camden, 16 Aug. 1780, was at the head of the Maryland and Delaware troops, who maintained their ground till Cornwallis concentrated his whole force upon them. He fell in the charge upon his regiments before they gave way. He died at Camden three days afterward, and a monument was erected there to his memory in 1825, Lafayette placing the corner-stone.

De Kalb, Ill., city in De Kalb County, on the Chicago & Northwestern Railroad, 60 miles west of Chicago. The industries of the city are the manufacture of wire and other iron products, glove and shoe manufacturing and agricultural machinery. De Kalb has 3 banks with a combined capital of \$350,000. The city is governed by a mayor and council of 10 members, elected for two years, and owns its own water-plant. The Northern Illinois State Normal School is located here. Pop. (1904) 6,000.

De Kay, Charles, American poet, grandson of Joseph Rodman Drake: b. Washington, D. C., 25 July 1848. He was educated at Yale and has been for many years the literary and art editor of the New York Times. His poems are mostly founded on themes from Oriental, classical and literary history. Among his works are: 'The Bohemian' (1878); 'Hesperus and Other Poems' (1880); 'The Vision of Nimrod' (1881); 'The Vision of Esther' (1882); 'The Love Poems of Louis Barnaval, by Charles De Kay' (1883).

Deken, dā'kēn, **Agathe**, Dutch author: b. Amstelveen, near Amsterdam, 14 Nov. 1741; d. 14 Nov. 1804. She wrote a number of novels

with her friend Elizabeth Bekker (q.v.) and poems, among them 'Lideren voor den Boerensland' and 'Lideren voor Kinderen.'

Dekker, Eduard Douwes, ɛd'oo-ård doo'-vës dɛk'kɛr, Dutch novelist, pseudonym "MULTATULI"; b. Amsterdam 2 March 1820; d. Nieder-Ingelheim 19 Feb. 1887. He spent several years in government service in the Dutch East Indies. His story, 'Max Havelaar' (1860), is a shocking accusation of wrongs and scandals against the Dutch administration of Java. He later published many satirical works on social, political, and philosophical questions, among them a volume of admirable 'Parables'; a novel, 'The Blessed Virgin'; a drama, and 'The School of Princes.'

Dekker, or Decker, Jeremias de, Dutch poet: b. Dort 1609 or 1610; d. Amsterdam 1666. His first published poetical work was 'The Lamentations of Jeremiah'; and several others which soon followed it were also translations. His 'Love of Gold,' a powerful satire, and his 'Goede Vrijdag,' or the 'Passion of Christ,' as well as his lyric poems, are still in high estimation; and his 'Epigrams' (Punt-dichten) are, beyond dispute, the best of the kind which the literature of that period produced. The best edition of his poems, accompanied with a biography, was published by Brouerius van Nideck (1726).

Dekker, or Decker, Thomas, English dramatist: b. London about 1570; d. after 1637. He is first mentioned as a theatrical writer in 1597. He was one of the literary antagonists of Ben Jonson, who satirized Dekker in his 'Poetaster,' and the latter took his revenge in his 'Satiromastix.' He appears to have lived from hand to mouth, and been often in difficulties, imprisonments for debt being almost the only record, besides his works, that is left of him. Among his writings may be mentioned the 'Seven Deadly Sinnes of London,' a moral tract; the 'Double P P,' a violent tract against the Catholics; 'A Knight's Conjuring,' in which he introduces Chaucer, Spenser, and many other dead poets; 'The Gull's Hornbook,' valuable as a picture of the time. Besides his own plays he co-operated with Massinger in the 'Virgin Martyr,' and with Ford in the 'Sun's Darling,' a moral masque; the 'Pleasant Comedie of Old Fortunatus' (1600); and 'The Honest Whore' (1604); are among the most esteemed of his dramas. The number of Dekker's plays is about 28, of his tracts about 25.

De Ko'ven, Anna Farwell, American novelist: b. 19 Nov. 1860. She was graduated at Lake Forest University in 1880, and married to Louis Reginald De Koven (q.v.) May 1884. She is the author of 'A Sawdust Doll' (1894); 'An Iceland Fisherman,' a translation from Pierre Loti (1889); 'By the Waters of Babylon' (1901).

De Koven, Henry Louis Reginald, American composer: b. Middletown, Conn., 3 April 1859. He was graduated at Oxford in 1879 and studied music in the leading cities of Europe. His operettas have had great success, notably: 'The Begum'; 'Don Quixote'; 'Robin Hood'; 'The Fencing Master'; 'The Three Dragoons'; 'Maid Marian'; etc.

De Koven, James, American Episcopal clergyman and educator: b. Middletown, Conn.,

19 Sept. 1831; d. Racine, Wis., 19 March 1879. He was educated at Columbia College and at the General Theological Seminary in New York. After his ordination to the priesthood in 1855, he took a pastoral charge at Delafield, Wis., and at the same time became principal of the preparatory school for Nashotah Seminary, founded two years earlier. In 1859 this became Racine College, and De Koven its first warden. He soon acquired a marked influence throughout the West, both in educational and ecclesiastical matters, in the latter taking up and carrying forward the teachings of the Oxford Movement. His most prominent appearance in this connection was in the General Convention of 1871, at a time when the ritual controversy ran very high. In bold and outspoken terms, which have become historical, he proclaimed and defended his position, with a marked effect on the legislation under discussion. When, however, in 1875, he was elected Bishop of Illinois, a considerable majority of the standing committees of the other dioceses refused to confirm his election, regarding his views as dangerous. He labored diligently for the upbuilding of Racine College, where he remained until his death. The published volume of his sermons (1880) contains a preface by Mr. Dix, which gives some idea of his commanding position in the church life of his time.

De Kroyft, dè kroift, Susan Helen, American author: b. Rochester, N. Y., 29 Oct. 1818. She was graduated at Lima College, New York, 1843, and married Dr. William De Kroyft, of Rochester, who was killed on his wedding day by a fall from a carriage. Mrs. De Kroyft shortly afterward lost her sight and has since then remained blind. Among her works are: 'Little Jakey' (1871); 'Darwin and Moses,' a lecture; 'A Place in Thy Memory' (1849); and 'Mortara.'

Del Credere, dël kréd'ě-rě, an Italian mercantile phrase expressing a guarantee or warranty, given by factors, brokers, or mercantile agents, who, for an additional commission, become bound not only to transact business for their employers, but also to guarantee the solvency of the persons to whom the goods are sold, or with whom business is done. This additional commission is known as a *del credere* commission. The term has come into general use in international commerce, and is recognized in the common law system of England and America.

De la Beche, dè lä bāsh, Sir Henry Thomas, English geologist: b. near London 1796; d. there 13 April 1855. In 1817 he became a Fellow of the Geological Society, of which he was afterward made secretary, and eventually president in 1847. Among his works are a 'Manual of Geology' (1831); 'Researches in Theoretical Geology' (1834); and a 'Geological Observer' (1853). He was founder of the Geological Museum and of the School of Mines. In 1848 he received the honor of knighthood.

Delaborde, Henri François, òn-rě frānswā dè lä-bórd, Count, French general: b. Dijon 21 Dec. 1764; d. 3 Feb. 1833. He distinguished himself in the Republican armies; fought through the whole of the Napoleonic wars, and was ennobled in 1807.

Delacroix, Ferdinand Victor Eugène, fěr-dē-nān vėk-tōr ɛ-zhān dē-lā-krwā, French painter: b. Charenton-St.-Maurice, near Paris,

26 April 1799; d. Paris 13 Aug. 1863. His first painting, 'Dante and Virgil in the Infernal Regions,' attracted much notice in the exhibition of 1822. This picture displayed a wide departure from the coloring and manner of the school of David, and accordingly it gave rise to enthusiastic praise on the one side; on the other to contemptuous depreciation, but everywhere to wonder. His 'Massacre in Scio' (1824) was a formal declaration of war against the school of the classicists, who named it a Massacre of Painting. These were followed by the 'Execution of the Doge Marino Falieri' (1826); the 'Death of Sardanapalus' (1827); and the 'Murder of the Bishop of Liège' (1830)—pieces painted with fire and vigor. His sympathy with the revolutionary party was shown by his celebrated picture of the 'Goddess of Liberty at the Barricades.' In 1831 he joined the embassy sent by Louis Philippe to the Emperor of Morocco. To this journey we are indebted for several pictures remarkable for their vivid realization of Oriental life as well as their masterly coloring. They are the 'Jewish Marriage'; 'Muley Abderrhaman With His Body-guard'; 'Algerian Ladies in Their Chamber'; 'Moorish Soldiers at Exercise'; and the several scenes of common life. In spite of his undoubted genius Delacroix failed in gaining popularity with the general public. He was commissioned not only with the decoration of public buildings, such as the Luxembourg Palace, the town-hall, and the Louvre, but large paintings were executed by him for the Parisian churches, and the historical museum of Versailles contains two of his masterpieces—the 'Battle of Taillebourg' (1838), and the 'Taking of Constantinople by the Crusaders' (1841). In 1857 the Academy elected him a member of their body. Delacroix was an artist of great versatility; mythology, legend, history, and poetry by turns furnished him with subjects, and in addition he painted portraits, allegorical and genre pictures, hunting scenes, etc.; but all exhibit at once his strength and his weakness—brilliant coloring and incorrect drawing.

Del'afield, Francis, American physician: b. New York 3 Aug. 1841. He was educated at Yale, and the New York College of Physicians and Surgeons, in which latter institution he has since been a professor of pathology and practice of medicine. He has published 'Handbook of Pathological Anatomy'; 'Handbook of Post Mortem Examinations and Morbid Anatomy'; 'Studies in Pathological Anatomy.'

Delafield, Richard, American military engineer: b. New York 1 Sept. 1798; d. Washington, D. C., 5 Nov. 1873. He graduated from West Point in 1818, and was draftsman to the American boundary commission, appointed under the treaty of Ghent. In 1819-38 he was assistant engineer in the construction of Forts Monroe and Calhoun; had charge of the improvements on the Mississippi, and of the building of the Cumberland road and the construction of Fort Delaware. In 1838 he was appointed superintendent of the Military Academy at West Point, and held the position seven years at that time, and again from 1856 to 1861, when he was relieved at his own request. In 1855 he was senior member of a commission sent to the Crimea to report on modern methods of warfare; he prepared the report which was published by Con-

gress in 1860. During the Civil War he assisted in organizing and equipping the New York troops and had charge of the construction of fortifications in New York harbor. In 1864 he was made chief of engineers, and retired in 1866 with the rank of major-general.

Delago'a Bay, a bay on the southeast coast of Africa, in Portuguese territory, partly enclosed by Inyack peninsula. It is about 70 miles long and 20 miles wide. Though crossed at its entrance by a shifting bar it is accessible to vessels of the largest class, and is the finest harbor on the east coast of Africa. Several large rivers flow into it. See PORTUGUESE POSSESSIONS IN AFRICA.

De la Hire, Philippe, fê-lêp dé là êr, French mathematician: b. Paris 18 March 1640; d. there 21 April 1718. He was a member of the Academy of Sciences and professor at the College of France. His chief work was in pure mathematics, but he was also an astronomer. Many of his papers are in the Memoirs of the Academy of Sciences. Among his writings are 'Nouvelle Méthode de Géométrie'; 'Sectiones Conicæ'; 'Mémoire sur la Epicycloïde' (1694); and 'Mémoire sur les Conchoïdes' (1708).

Delambre, Jean Baptiste Joseph, zhôn báp-têst zhô-zêf dé lân-br, French astronomer: b. Amiens, France, 19 Sept. 1749; d. Paris 19 Aug. 1822. In 1790, eight years after the discovery of Uranus, Delambre published the tables of that planet, although in that period it had but performed a small part of its eighty years' course. He also constructed tables of Jupiter and Saturn, and of the satellites of Jupiter, which, with several treatises, procured him a reception into the National Institute. In 1802 Napoleon appointed him inspecteur-général des études, which post he resigned when chosen perpetual secretary of the class of mathematical sciences (1803). His first tables of the sun were published in 1792; in 1806 appeared his new ones. In 1807 he succeeded Lalande in the Collège de France, and wrote his 'Traité d'Astronomie théorique et pratique' (1814); 'Histoire de l'Astronomie du moyen âge' (1819); 'Histoire de l'Astronomie moderne' (1821); 'Histoire de l'Astronomie du 18me Siècle.'

Delamination. See EMBRYOLOGY.

De Lancey, Edward Floyd, American historical writer: b. Mamaroneck, N. Y., 23 Oct. 1821. He is a son of W. H. De Lancey (q.v.). He is author of 'Documentary History of New York' (1851); 'The Capture of Fort Washington the Result of Treason' (1877); 'Origin and History of Manors in the Province of New York' (1866).

De Lancey, William Heathcote, American Protestant Episcopal bishop: b. Westchester County, N. Y., 8 Oct. 1797; d. 1865. He was graduated at Yale College in 1817; studied theology and entered the Episcopal ministry in 1822. He was secretary of the house of bishops in the general convention of the Episcopal Church of the United States 1823-9. Upon the reorganization of the University of Pennsylvania in 1828, he was chosen provost of that institution, and remained provost five years. In 1839 he became bishop of the diocese of Western New York.

Deland, Ellen Douglas, American writer for young people: b. Lake Mahopac, N. Y., 3

Sept. 1860. She was educated in New York but until very recent years has lived mainly in Philadelphia. Her published books include 'Oakleigh' (1896); 'Malvern' (1896); 'In the Old Herrick House' (1897); 'A Successful Venture' (1897); 'Alan Ransford' (1898); 'Katrina' (1898); 'Three Girls of Hazelmere' (1903).

Deland, Margaret Wade Campbell, American novelist: b. Allegheny, Pa., 23 Feb. 1857. She was educated at the Cooper Union, New York, and for a time taught drawing. In 1880 she married L. F. Deland and has since lived in Boston. 'John Ward, Preacher' (1888), her first novel, attracted wide notice. Other works are 'The Old Garden and Other Verses' (1887); 'Sydney' (1890); 'Florida Days,' a collection of sketches of travel; 'The Story of a Child' (1892); 'Mr. Tommy Dove and Other Stories' (1893); 'Philip and His Wife' (1894); 'The Wisdom of Fools' (1897); 'Old Chester Tales' (1901); 'Good for the Soul.'

De Land, Fla., town, county-seat of Volusia County, on the Jacksonville, Tampa & Key West Railroad; about 55 miles southwest of Saint Augustine. It is a favorite health resort, noted for its sulphur springs. The John B. Stetson University, a Baptist institution, was established here in 1887. Pop. 1,510.

Delane, John Thaddeus, English journalist: b. London, 11 Oct. 1817; d. 22 Nov. 1879. After leaving Oxford he studied life in many forms, walked the hospitals, was called to the bar, and reported in the House of Commons. In May 1841 he became editor of the *London Times*. For 36 years Delane held this post. Under his editorship the *Times* attained a prodigious circulation, and an influence unparalleled in the history of journalism. He merged his personality in his paper, and the history of his later life is the history of the extraordinary influence wielded by the leading journal. He was singularly shrewd in weighing public opinion, possessed remarkable foresight, and seldom made a mistake. He resigned the editorship in 1877.

De'ano, Columbus, American lawyer and politician: b. Shoreham, Vt., 5 June 1809; d. Mount Vernon, Ohio, 23 Oct. 1896. He studied law at Mount Vernon, was admitted to the bar in 1831, and shortly after elected prosecuting attorney of the county. He was elected member of Congress in 1844 and voted against the declaration of war in Mexico; he was again elected to Congress in 1864 and 1866. He was delegate to the Republican conventions of 1860 and 1864, and member of the State Legislature in 1863. In President Grant's first administration he was appointed commissioner of internal revenue, and reorganized the department, putting it on an excellent financial footing. In 1870 he became secretary of the interior, resigning in 1875, and retiring from public life. He was one of the trustees of Kenyon College and endowed its preparatory department.

Delany, Mary Granville, English writer: b. Coulston, Wiltshire, 14 May 1700; d. Windsor 15 April 1788. She married first, in 1718, Alexander Pendarves (1659-1724); and secondly, in 1743, Swift's friend, the Rev. Patrick Delany (1685-1768). After his death she lived chiefly in London. Her much-admired "paper mosaics," or flower-work, have long since faded;

but she is remembered through her patronage of Miss Burney, and by her 'Autobiography and Correspondence' (1861-2), with its gossip of the court and the literary society of her day.

Delaplanche, Eugène, French sculptor: b. Paris 1836; d. there 1891. He was a pupil of Duret, received the grand prize of Rome, 1864, and the medal of honor 1878. Among his works are: 'Child and Turtle'; 'Eve Before the Fall'; 'Saint Agnes'; 'Maternal Education'; 'Harmony'; 'Africa,' in bronze; 'Music'; 'Virgin of the Lilies,' in the Luxembourg; 'Aurora,' also in the Luxembourg; 'Circe'; 'The Dance'; and a statue of 'Auber' for the opera house. He is noted for grace and nobility of treatment and refinement of style.

De Lara, Isidore (COHEN), English composer: b. Dublin. He was a pupil of Muzucato in Milan, and gained great popularity in England by singing his own compositions, especially drawing-room songs. His opera 'Moina' was given at Monte Carlo in 1891, and his 'Amy Robsart,' with libretto by Augustus Harris, was produced at Covent Garden, London, in July 1893, but the music was not notable. The music of his 'Messaline' has been deemed lacking in originality. The libretto was by Armand Silvestre and Eugene Morand. This opera was produced at Monte Carlo 21 Feb. 1899; in London 1899 and 1900, with Calvé in the leading part, and in New York in 1902 with Calvé and Alvarez.

De la Ramée, dè lä rä mā, Louise. See OUIDA.

De la Rey, Jacob Hendrick, Boer general: b. Lichtenburg District of the Western Transvaal 1849. He gained distinction in his first command against the Basutos, when very young, and served two years in the Volksraad, supporting Joubert. He commanded the Lichtenburg burghers at the outbreak of the Boer-British war, 1899-1902, which force served later in Cronje's western column. He distinguished himself at Magersfontein; in the retreat before Lord Roberts, and at Nooitgedacht 1900, where he captured 500 English troops. He captured Lord Methuen 7 March 1902 with many of his men, but released him on account of not being able to treat his wounds, lacking hospital facilities; an instance of his noted humaneness. He was very popular with the Boers and his military skill was greatly respected by his foes. He served on the Boer committee which arranged for peace, and, later, on the deputation visiting Europe and the United States to raise funds for the Boers that they might continue their occupations at home.

De la Rive, Auguste, Swiss physicist: b. Geneva 9 Oct. 1801; d. Marseilles 28 Nov. 1873. He received the appointment to the chair of natural philosophy in the Academy at Geneva at the age of 22. First devoting himself to the study of the specific heat of gases, and of the observation of the temperature of the earth's crust, he soon turned his complete attention to electricity, making original discoveries in connection with magnetism, electrodynamics, the relation between magnetism and electricity, and the properties of the voltaic arc, and presenting new theories upon the subject of the aurora borealis. He discovered the process of electro-gilding, for which he received the grand prize of 2,000 francs from

DELAROCHE—DELAWARE

the Académie of Sciences 1842, becoming one of the eight foreign associates of the Académie in 1864. His chief work was a complete treatise on electricity in three volumes, which was translated into several languages, and was considered of the highest authority upon the subject.

Delaroché, Hippolyte, ē-pō-lēt dē-lā-rōsh, (familiarily styled PAUL), French painter: b. Paris 17 July 1797; d. there 4 Nov. 1856. He entered the studio of Baron Gros, and rapidly rose to eminence as one of the greatest of modern painters in France. His subjects are principally taken from French and English history. Among others may be mentioned, 'St. Vincent de Paul Preaching before Louis XIII. on Behalf of Deserted Children'; 'Joan of Arc Interrogated in Prison by Cardinal Beaufort'; 'Flora Macdonald Ministering to the Pretender after the Battle of Culloden'; the 'Death of Queen Elizabeth,' a work greatly admired by French and generally reprobated by English critics; 'A Scene of the St. Bartholomew Massacre'; 'The Children of Edward IV. in the Tower'; 'Cardinal Richelieu conducting Cinq Mars and De Thou up the Rhone to Execution'; 'Cromwell Contemplating the Dead Body of Charles I.,' one of Delaroché's most exalted efforts; the 'Execution of Lady Jane Grey,' and the 'Death of the Duke of Guise.' What he considered his *chef-d'œuvre*, was the pictorial decoration of the hemicycle of the Palais des Beaux Arts, on which he was engaged from 1837 to 1841. In this composition Delaroché has sought to illustrate the history of art from the remotest period to the present day, by representing, in one compartment, the great artists of all ages, painters, sculptors, and architects. Notwithstanding the number of persons depicted (upward of 80), and the diversities of figure and costume, the whole presents a group in perfect harmony, with a coloring at the same time quiet and rich, and a correctness of drawing which leaves nothing to be desired. It has often been objected to Delaroché that the accessories of his pictures are finished with such minuteness as to divert the attention from the main subject. His signal merits consist in correct drawing, brilliant and harmonious color, and great distinctness and perspicuity in treatment, rendering the story of his pictures at once intelligible.

De la Rue, Warren, English inventor and physicist: b. Island of Guernsey 18 Jan. 1815; d. London 19 April 1889. He was educated in Paris and followed his father's business, that of manufacturing paper wares. For this he invented many new processes and machines. He is best known for his application of photography to astronomy. He was a member of the International Electrical Congress at Paris in 1861, president of the Royal Astronomical Society, and held other posts of honor. His reports of original observations in chemistry, astronomy, and physics are of the greatest value.

Delaunay, Charles Eugène, shārī ē-zhān dē-lō-nā, French astronomer: b. Lusigny, Aube, 9 April 1816; d. Cherbourg 5 Aug. 1872. He studied at the Ecole Polytechnique, becoming a mining engineer. He taught mechanical engineering at the Polytechnique and on the Faculty of Sciences of Paris, and was made a member of the Institute in 1855. In 1870 he succeeded Leverrier as director of the Observatory. Among

his works are: 'On a New Analytical Theory of the Movement of the Moon'; 'Theory of the Tides'; 'Slowing of the Rotation of the Earth'; 'The Seasons'; and a 'Report on the Progress of Astronomy' (1867).

Delaunay, Jules Elie, zhūī ā-lē, French figure and portrait painter: b. Nantes 12 June 1828; d. Paris 5 Sept. 1891. He received the Grand Prix de Rome in 1856; the first-class medal at the Paris Exposition of 1878; and at that of 1889 was awarded the medal of honor. He was made an officer of the Legion of Honor and a member of the Institute. His portraits are considered masterpieces. His 'Diana' is in the Luxembourg Gallery, Paris, and the 'Death of the Centaur Nessus,' in the Museum at Nantes.

Delaunay, Louis Arsène, loo-e ār-sān, French actor: b. Paris 21 March 1826; d. Versailles 22 Sept. 1903. He made his début in Oct. 1846, at the Odéon. In 1848 he acted at the Théâtre Français in the role of Durante, becoming secretary to the theatre in 1850. Till he retired (1887), he was one of the most accomplished actors on the French stage. He has found some of his greatest parts in the plays of Hugo, Pailleron, De Musset, and Augiers.

Delavan, Wis., a city of Walworth County near Delavan Lake, and on the Chicago, Milwaukee & St. Paul Railroad. It has some manufacturing interests, including dairies. It is the seat of the State institution for the education of the deaf; and on account of mineral springs in the vicinity and the lake is a place of summer resort and the site of a summer school. Pop. (1900) 2,244.

Delavigne, Jean François Casimir, zhōn frān-swā kāz-ē-mēr dē-lā-vēn-yē, French poet and dramatist: b. Havre 4 April 1793; d. Montmorency 11 Dec. 1843. He was educated at the Lycée Napoléon, Paris, and in 1811 composed a dithyrambic on the birth of the King of Rome, which attracted considerable attention, and procured him, from Count François de Nantes, a situation in the office of indirect taxes. At the Restoration he published a set of elegies entitled 'The Messenians,' which deplored the faded glories of France. He produced in 1819 his tragedy of 'The Sicilian Vespers'; 'The Comedians' appeared in 1820, and the tragedy of 'The Paria' in 1821. Of his other plays which followed these may be mentioned: 'The School of Old Men'; 'Marino Faliero' (1829); 'Louis XI.,' founded on Commines' 'Memoirs'; 'Quentin Durward'; 'Don John of Austria.' His hymns, 'The Parisienne' and 'The Varsovienné,' and the ballad 'The Toilette of Constance' are among his more popular poetical pieces. He became in 1825 a member of the Academy.

Delaware ("the Diamond State"), the smallest but one and the least populous of the 13 original States; southernmost of the Middle States; 96 miles long by 9 to 37 broad, 2,050 square miles in area, 1,960 square miles of land. It is bounded east by the Atlantic, Delaware Bay, and Delaware River, the latter separating it from New Jersey; north by Pennsylvania, the boundary being a semicircle struck 12 miles from New Castle court-house; west and south by Maryland, arbitrary lines at a right angle. The broadest part is about 25 miles of the

DELAWARE

extreme south, whence it narrows almost regularly to the north. Capital, Dover, near the centre. Pop. (1903) about 190,000.

Topography.—The whole peninsula between Chesapeake Bay and the Delaware River estuary and bay, divided between Maryland and Delaware, is part of the Atlantic coastal plain; flat, sandy, and with frequent swamps, of which there is one of about 70 square miles in southern Delaware. North of New Castle, where the Pennsylvania uplands sink down to it, there is a handsome rolling country; and behind Wilmington, the divide between Brandywine and Christiana creeks becomes a ridge rising to a hill 280 feet high, the most elevated ground in the State, with pleasing scenery along the streams. South of this, a marshy and sandy ridge nowhere over 70 feet high runs through the State northwest to southeast, forming the watershed between the bays, but following the line of the Atlantic coast about a dozen miles inland. In the southwest, therefore, the part of the State west of the ridge is bulky enough to create some fair-sized creeks, all feeding the Nanticoke in Maryland. The other streams are all petty brooks except in the extreme north, where Brandywine and Christiana creeks flow southeast from Pennsylvania, unite a half mile from the Delaware, and form a deep-water estuary which constitutes Wilmington harbor, which contributes to the greatness of the city. The only other good harbors on this marshy coast are at New Castle and Lewes, the latter protected by the Delaware breakwater at Cape Henlopen. On the southeast coast are two considerable but shallow lagoons called Rehoboth Bay and Indian River Bay, communicating at the outer edge, and separated from the sea by a sandspit pierced by Indian River Inlet, through which and on them vessels under six feet draft can navigate. Delaware Bay itself has 35 to 75 feet of water in mid-channel.

Natural Products.—The State has three geological divisions: Cretaceous in the north, succeeded southward by Tertiary and post-Tertiary, or Alluvial. The most valuable minerals, naturally, are found in the upper levels in the north. Near Wilmington are granite quarries which turn out over \$600,000 of products a year; kaolin or porcelain clay beds, among the first worked in the United States, and which in 1900 produced 10,500 tons, valued at \$91,500; and other clays for brick and terra-cotta. There is found also glass sand, feldspar, shell marl in the greensand districts, and bog-iron ore in all the swamps. The natural woods of the State are valuable, but most of them have been cut away (including the white-oak for shipbuilding once plentiful) except the forests of cypress, hackmatack, and other evergreen in the swamps. There is much shooting of wild ducks and teal, wild geese, etc., and some terrapin are caught.

Climate and Rainfall.—Delaware naturally has a range of temperature intermediate between the severe extremes of New England and the heat of the South; and still further tempered by the sea breezes which alternate with the southwest winds in summer. The northwest winds of winter and spring are probably not more severe than of old, but the delicate crops, like peaches, have furnished a more costly thermometer, and the precariousness of the spring warmth is felt. On an average, the spring begins about 1 April, and the autumn

frosts toward the middle of October; the average temperatures run from about 85° in August to 25° in January. The rainfall is from 40 to 45 inches annually, the heaviest on the coast; and droughts never become ruinous. In the swampy districts and southern lowlands there is some malaria; but as a whole the State has a good sanitary record.

Soils and Agriculture.—The soil of the State steadily lightens southward from a heavy rich clay in the north, and for some miles inland along the Delaware River, to loamy clay and loam in the centre, and sand with some loam in the south. The north is the region of cereals and hay; the centre and south, of fruits, berries, grapes, and vegetables; and the south especially of peaches and strawberries. The State is one immense market garden and orchard for the North, especially the great cities not far away,—New York, Philadelphia, and Baltimore. New Jersey, Maryland, and Delaware raise three fourths of all the peaches, berries, and small fruits sold in these markets. Delaware in the popular mind is identified with the peach crop, which in good years has yielded 4,000,000 baskets or crates; but a considerable percentage of the trees have been injured and the crops frequently blasted by the late spring frosts in recent years, and there is a growing tendency to replace entire reliance on this precarious crop by market gardening and even cereals. Still, the railroad freightages in the summer of 1902 were estimated at 2,351,460 baskets, besides 362,345 baskets of pears. The other orchard fruits together exceed the peaches; the apple crop especially is very large. Of the market gardening, the tomato is by far the principal crop, and is exceeded only by that of Maryland and Indiana; 16,000 acres were planted in 1902, and 750,670 cases sent out, of 24 cans each, or 18,160,000 cans. A surprising development, however, in which it is alone among the eastern States, has been in the wheat crop for the past two decades: its acreage in 1900 was 118,740, or nearly one sixth of all the improved land, against 87,530 in 1880. In 1902 it raised 1,792,006 bushels. The first place in acreage, however, belongs to corn, 187,134 in 1902, or about one fourth of all; the yield was 5,239,732 bushels. Third was hay, 76,373 acres, 83,247 tons. There were also 6,000 acres of potatoes, with a yield of 471,000 bushels, or 78.5 bushels to the acre, against 48 in 1900. The dairy interest has enormously increased in the decade: in 1900 there were 21 creameries and one cheese factory, against five creameries in 1890; the capital had increased from \$19,085 to \$88,155, and the value of products from \$124,780 to \$252,890.

Outside of its one great manufacturing city, the agricultural interest is supreme; no other State compares with it in the proportion of land under cultivation. Of the total land surface of 1,254,000 acres, 1,066,228 was in farms in 1900, and 754,010 were improved, or 60 per cent of the whole soil. Less than half the farmers own their own farms, and nearly the same number work on shares. The thin soil of the south—which reduces the average value of farms from \$45 in the north to \$12—has also made heavy use of fertilizers necessary. Stock farming is not much practised, save milch cows.

Manufactures.—While Delaware as a State is predominantly agricultural, the enormous relative magnitude of its one great city, Wilming-

DELAWARE

tion (containing two fifths of its entire population), and the industries concentrated around it, makes the northern end a very important manufacturing section. The great natural advantages of the spot were early utilized; the deep harbor for building the largest ships, the 100-foot falls of the Brandywine four miles from its mouth, and the proximity to the great coal and iron fields of Pennsylvania, Maryland, and Virginia. All branches of iron and steel manufacturing are carried on to an immense extent. The first iron sailing vessel in the country was built in 1854 in Wilmington, which had previously been noted for building wooden ships; and up to 1900 that city had built over 400 iron and steel steamers, more and of greater aggregate tonnage than any other single port in the United States. The two companies there built 13 such vessels in 1900. Pumping and mining apparatus and paper-making machinery are famous specialties; in 1817 the first endless-sheet paper machine was set up in Wilmington, revolutionizing the business. Its manufactories of steam and street cars, machine tools, engines, boilers, etc., are known all over the globe. Next to iron and steel comes the dressing and manufacture of leather, in which Delaware stood sixth of the United States in 1900, against ninth in 1890. Wilmington has one of the largest morocco plants in the world. The flouring-mill industry comes next, but is slightly falling off, as this business tends to go West; then the manufacture of fertilizers; and next the canning business; both of which are increasing immensely, and more than doubled in the decade. There is a considerable textile manufacture, but not as much as formerly. The most interesting concern is the great powder works of the Du Ponts on the Brandywine, a few miles from Wilmington, the oldest and largest of the kind in the country. The company was founded by the French exile, Du Pont de Nemours, in 1802, and till 1902 remained a family preserve; in that year it was turned into the E. J. Du Pont de Nemours Company, with a capital of \$20,000,000. There is a petroleum refinery at Marcus Hook.

Fisheries.—The oyster, shad, and sturgeon fisheries of the State are of considerable magnitude, the whole fish catch being worth some \$250,000 a year and employing about 2,500 men.

Commerce and Transportation.—The Delaware district reports over \$750,000 a year of exports and imports, and clears about 250 vessels. Wilmington, Lewes, and New Castle are ports of entry, and the former is a customs district. It has some direct foreign commerce, a steamer line to New York, and coasting lines to Philadelphia and down the bay; besides communication with Baltimore by the Delaware & Chesapeake Canal (see CANALS), 13½ miles long, 66 feet wide, and 10 feet deep, completed in 1829. The great Delaware Breakwater opposite Lewes was begun the year before, and completed 1869; it cost over \$2,000,000, and forms an artificial harbor some 300 acres in extent, with 24 feet of water. (See DELAWARE BREAKWATER.) Railroad facilities are excellent; there are about 360 miles of main track in the State. The one great line, which serves nearly all the State, is the Philadelphia, Baltimore & Washington, whose main line runs through it lengthwise from Wilmington to Delmar at the southern boundary, where it connects with another to Cape Charles and Norfolk; its Delaware, Maryland & Virginia

branch in the southeast serves that portion. Other branches run from it. In the north, the Baltimore & Ohio, and the Philadelphia, Wilmington & Baltimore division of the Pennsylvania system, parallel each other through Wilmington and the line to Philadelphia and Baltimore. Queen Anne's Railroad runs across the centre to Chesapeake Bay.

Banks, etc.—There are 20 national banks in Delaware, with a capital of some \$2,250,000, and deposits of about \$7,000,000; reserve, about \$2,500,000. There are also two State banks, with \$600,000 capital, deposits of \$1,750,000, and resources of \$3,000,000; and two mutual savings banks, with deposits of over \$5,000,000. In these regions, however, the building and loan association takes largely the place of the northern savings bank. There are several local fire and mutual life-insurance societies.

Churches.—The strongest religious denomination is the Methodist Episcopal; next in order of size are the Presbyterian, Protestant Episcopal, Baptist, Roman Catholic, Quakers, and Lutherans; and there are several smaller ones. There are about 1,200 church organizations, and an enrolment of toward 50,000 members. Wilmington is the seat of the Roman Catholic diocese of that name, embracing Delaware and part of the southern peninsula, and of the Protestant Episcopal diocese of Delaware.

Charities and Penal Institutions.—There is a State Insane Hospital, with about 350 inmates. There being no State institutions for the feeble-minded, deaf-mutes, or the blind, the statutes permit five of the last two classes from each county, and 14 imbecile children from the State, to be maintained at institutions of other States; and they are so kept at Philadelphia and Washington. The Ferris Industrial School for Boys at Wilmington has about 75 inmates. There is a public workhouse in Newcastle County, with indeterminate sentence. The whipping-post is a punishment for minor offenses.

Education.—The public schools are supported by local taxes; by a State distribution of the income of a fund now some \$580,000, and of the proceeds of certain taxes, both yielding about \$140,000 a year, devoted entirely to paying teachers' salaries and furnishing free text-books; and by an annual appropriation beyond this, fixed by the constitution at a minimum of \$100,000. The teachers number about 640 females and 210 males; the salaries of the former averaging about \$34 a month and of the latter \$36.60. The school year is longer and schools much more developed in the Wilmington district than elsewhere; and this manufacturing section has been prevented from greatly improving the system by its under-representation in the State government, due to an unfair apportionment. Of about 50,000 children in the State, between 5 and 18, something over half attend school for six months and more, and about 4,000 others for shorter periods; it is notable that the attendance of foreign-born children, and native-born of foreign parents, is much higher than that of the pure natives, owing to the former being concentrated in Wilmington, where the schools are best. There are separate schools for the colored population, and a State agricultural college for them at Dover, which graduates three or four annually. There are 14 academies, seminaries, and high schools; and one college, Delaware College at Newark (coeducational), with scientific

DELAWARE

and normal departments. It had 114 students in 1902. Otherwise there is no normal school; but there are teachers' institutes in each county. There is a State Board of Education, and in each county a school commission and a superintendent of public instruction.

Government.—The present constitution is of 1897; following the now usual Southern practice, it was not submitted to the people. The registration and educational provisions for the franchise enable the exclusion of all whom the governing classes think unfit. The legislature has a senate elected for four years and a house for two. The senate has seven members from Newcastle County (Wilmington, etc.), and five from each of the other two; the house has 15 members from Newcastle and 10 from each of the others. Sessions are biennial. Provisions for revenue and impeachment are the same as in the national Constitution. The members are paid \$6 a day up to 60 days, after which they sit at their own expense; special sessions are thus limited to 30 days. The State officers are chosen for four years. The governor has a veto by items; his pardoning power is on recommendation of a board of pardons. The judiciary is composed of a supreme and superior court, a court of chancery, orphans' court, court of oyer and terminer, and registers' court; there are six judges,—a chancellor and five "law judges," of whom one is chief justice. They are appointed by the governor for 12 years, with the concurrence of the Senate.

The State has one representative in Congress, and therefore three members of the Electoral College, chosen by popular election.

There is a National Guard of 321 privates and 51 officers.

Finances.—Delaware's bonded debt in 1902 was \$769,750, mostly incurred in 1887 and 1897. The assets were \$1,118,509.16, over \$1,000,000 invested. The State expenditures were \$341,000. There are no State taxes on individuals; the receipts are from fees and licenses, inheritance tax, special tax on banks and railroads, etc. The assessed valuation of the State is about \$76,000,000.

Divisions and Population.—The State has three counties: Newcastle, Kent, and Sussex. The former, containing Wilmington, has three fifths the entire population of the State. The counties are divided into "hundreds" instead of townships, the towns being included in the hundreds. There are 35 incorporated cities and towns, of which Wilmington is the only large one; it had 76,508 in 1900, and has about 80,000 now. Of the others, the chief are New Castle, 3,380, a decrease from 4,010 in 1890; Dover, the capital, 3,329, slightly growing; Milford, 2,500; Lewes, 2,259; Smyrna, 2,168.

The population from the first census to the last is as follows: 1790, 59,094; 1800, 64,273; 1810, 72,674; 1820, 72,749; 1830, 76,748; 1840, 78,085; 1850, 91,532; 1860, 112,216; 1870, 125,015; 1880, 146,608; 1890, 168,493; 1900, 184,735. Of these, the males were 3,581 in excess. The colored were 30,758, or almost one sixth. The foreign-born numbered 13,810; the native-born of foreign parentage, 22,219. In Indian River hundred, Sussex County, there is a considerable body of "white Indians" or "Moors," traditionally descended from a band of shipwrecked Moorish sailors. They do not associate with

the colored race, and maintain separate schools and churches with the help of the State.

History.—Delaware represents the sole attempt of Sweden to seize its share of America. It does not take its name from the Indians who inhabited it, but from the river and bay, named by the English after Lord de la Warr, who explored it in 1610; the Dutch called the river "South River," as distinguished from the "North River," the Hudson. The first settlement actually made in Delaware was by the Dutch trader, De Vries, in 1631, at Paradise Point, the present Lewes; he called it Hoornkill, from his Dutch home, but the English corrupted it to Whorekill, and invented a story to account for the name—as usual. The agent he left there fell out with the Indians, who slaughtered the whole settlement and burnt the manor house. In 1637 Axel Oxenstiern, the great Swedish minister of Gustavus Adolphus, revived his dead master's plan of founding a Swedish West India Company, and sent Peter Minuit, the ex-director-general of New Netherlands, with a mixed Swedish and Dutch expedition to seize and settle a point on the coast. Minuit landed April 1638, and fixed on the peninsula, where Wilmington now stands, about two miles back from the Delaware; he called the creek "the Elbe," and built a fort which he called Christina, after the girl-queen of Sweden, Gustavus' daughter. The creek later was given that name, now corrupted to Christiana, locally and more correctly Christeen. The entire domain he called New Sweden. The Dutch protested, but as their company had to pay its own war bills, they did no more; and in 1640 the Swedish government sent another body of colonists. More Dutch came also and settled some miles below; the stockholders of the enterprise were part in Holland and part in Sweden, and each party sent its own countrymen. The Swedish settlements were vigorous and spread rapidly, colonizing New Gottenburg at Tinicum Island and Upland near by, driving a New Haven English colony off Salem Creek in New Jersey and keeping the place themselves, with a fort called Elsenburg. In 1646 the Dutch built a block-house on the site of Philadelphia, opposite Fort Nassau built by them in 1623; the Swedish governor, Printz, marched there and pulled it down. But when Stuyvesant came to New Netherlands in 1647, he was under orders to fight; and in 1651 he built Fort Casimir on the site of New Castle, blocking the Delaware to the Swedes. Rising, Printz's successor, attacked and captured it in 1654, and changed its name to Trinity. Stuyvesant came down in 1655 with a large force, captured not only Trinity, but Christina, deported the officers to New Amsterdam, and forced the rest to swear allegiance to the Netherlands or leave the country. Trinity was renamed New Amstel. The Swedish dominion was ended; but its blood remained, and the tradition of alien independence in the mixed colonial strain made it utterly unassimilable, and has created the present State. The Dutch divided it into the historic three counties.

When the Duke of York took New Amsterdam from the Dutch in 1664, the Delaware settlements went with it, and New Amstel was renamed New Castle. When the Dutch retook New York in 1673, there was a renewed Dutch rule on the Delaware. In 1682 (24 August), William Penn, to give his new colony control of

DELAWARE — DELAWARE INDIANS

the mouth of the Delaware, bought the lower settlements; it then contained about 6,000 Swedes, English, Dutch, and mixed breeds, who had always been governed by themselves or by a deputy from New York. He also bought a lingering boundary dispute with the Baltimores, not settled till 1768. The lower river settlements were at first governed as part of Pennsylvania, being called the "Three Lower Counties on the Delaware," and sending six representatives apiece to its legislature; but there was no community of interest and a violent discontinuity of feeling, and the lower counties insisted on a separate legislature. They obtained it in 1703, with a separate council in 1710, and kept it till the Revolution, the sessions being held at New Castle. The same governor was appointed for both, however. In the Continental Congresses the colony was separately represented, as "The Counties of New Castle, Kent, and Sussex, upon Delaware"; and on 21 Sept. 1776 it proclaimed a State constitution as "The Delaware State." For some years, however, it chose the same governor as Pennsylvania. It was the first (7 Dec. 1787) to ratify the national Constitution. In 1792 it adopted a new constitution and the name of "The State of Delaware"; in 1831 a third, and in 1897 the present one.

Delaware's naturally divided position as a slave-holding border State has been sharply accentuated by the natural antagonism between its agricultural and manufacturing sections. The northern part, an outcrop of the Pennsylvania manufacturing interests, has shared the Northern sympathies; the southern has always been Southern in feeling, and sent numbers of soldiers to the Confederate side in the Civil War. But the large preponderance of population in the north, though hampered by an unjust system of representation, made itself vigorously felt in the War; the legislature promptly voted "unqualified disapproval" of the proposal to secede; it answered the calls for Union troops so quickly and fully that Lincoln said in his message of 3 Dec. 1861, "Noble little Delaware led off right from the first"; and out of its 40,000 males from 14 to 60, it sent nearly 14,000 men to the Union armies, or over one third. When Reconstruction began, however, the legislative majority sympathized with their class, and denounced the Fourteenth Amendment, which the new constitution virtually abrogates. The leading element in the State politics since 1850 has been the "peace Democrats," devoted to the Union, but opposed to coercion of the States; as exemplified in the Bayard family (see BAYARD, JAMES A., 2D, and THOMAS F.). The Democratic majority, however, has been always small, except in 1878, when the Republican party was temporarily ruined by joining the Greenback-Labor movement. This balance has formed the basis of the effort for some years to win over Democrats enough to send John E. Addicks to the Senate (see ADDICKS, JOHN E., for a full description of the details), which has resulted in depriving Delaware of one senator for some years and of both latterly.

The people of Delaware are familiarly termed "The Blue Hen's Chickens," from their Revolutionary flag. As such, they were among the finest regulars in the Continental army.

Delaware, Ohio, city, county-seat of Delaware County; on the Whetstone (Olentangy) River, and on branches of the Cleveland, C.

C. & St. L., the Columbus, S. & H., and several other railroads; 24 miles north of Columbus. It is the trade centre of Delaware and surrounding counties, and has manufactures of iron, flour, woolen, lumber, furniture, agricultural implements, etc. It is the seat of Ohio Wesleyan University, and the Ohio Wesleyan Female College. There are sulphur, magnesia, and other mineral springs nearby, and the city has large railroad repair shops, hotels, daily and weekly newspapers, and two national banks. Pop. (1900) 7,940.

Delaware Bay, a large bay or arm of the sea, between the States of Delaware and New Jersey. The Delaware River and several small streams flow into this bay. It is 65 miles long, and in the centre about 30 miles across, and about 15 at its mouth, from Cape Henlopen to Cape May. At the entrance to this bay, near Cape Henlopen, is situated the Delaware Breakwater, the object of which is to afford vessels a shelter within the cape. The breakwater proper is 1,200 yards in length, and runs in a straight line from east-southeast to west-northwest, leaving an entrance 650 yards wide between its east end and the north point of the cape. It serves also as an ice-break against the floating ice which sometimes comes down the bay. At the distance of 350 yards from the upper or western end of the breakwater a similar dike, of 500 yards in length, is projected so as to form an angle of 146° 15' with the breakwater. Government lighthouses are stationed at the entrance, to indicate shoal places in the channel and breakers along the shore.

Delaware College, an institution founded at Newark, Del., 1833, closed in 1859. In 1870 it was reopened as a "Land Grant College"; the State of Delaware appropriating funds received under the Land Grant Act of 1862. Further aid received from the State funds obtained under the congressional act called the "Hatch Bill," enabled the college to open an experiment station in 1887. A still further grant was received under the act of 1890. The library contains (1903) about 14,000 volumes; the number of students enrolled in 1902, 75.

Delaware Indians (their own name Renno Renappi, or Lenno Lenape, "men": cf. Illinois, Innuít, Lokono, Muysca, Alemanni, etc.), an important Algonquin tribe which lay in the path of white settlement on both sides of the Delaware River, and therefore fills a large place in colonial history. Previously they had been subjugated by the Iroquois, who, instead of exterminating or absorbing them, exacted tribute, called them "women," and dictated their action. The early Dutch settlers were massacred as usual; but the Swedes on the Delaware upheld Indian titles to land to secure their own possession against the Dutch, compelling the latter in turn to buy instead of seizing, so there was peace with the Delawares in this period. The Swedes tried to Christianize them with Luther's catechism, without much success. In October 1682 Penn made his famous treaty with them, as well and as ill kept by his successors as others of the kind; that the Delawares did not revenge the white encroachments by massacre was due to Penn's sagacity in buying up their overlords, the Iroquois, who threatened to destroy them if they molested "Onas'" people. The infamous trick

DELAWARE RIVER—DELEB PALM

of the "Walking Purchase" (q.v.) in 1737 (denounced by the Quakers) ousted them from half a million acres in the forks of the Delaware above Easton, and the Iroquois with furious menaces compelled them to retire to the Susquehanna. Here settlement pursued them, and not daring to resent it, a large part of them by 1750 had removed to the Allegheny and Muskingum, where they recovered Indian courage and ferocity. The Moravian missionaries converted part of the remainder, and these always remained peaceful. The others, maddened by aggression, joined the French and Iroquois in the French and Indian war, and helped in Braddock's defeat; sullenly yielding in 1758, after the Senecas had turned against them, they broke out again in Pontiac's Conspiracy (q.v.) of 1762, and were among the besiegers of Detroit, Fort Pitt, Duquesne, etc. Defeated by Bouquet at Bushy Run, 1763, they made peace in 1764-5. In 1768 all the remnants east of the Alleghenies migrated west; and the Christian Delawares founded the village of Gnadenhütten on the Muskingum. Roving bands of the others kept the field till the crushing defeat of Point Pleasant (q.v.), 1774. In the Revolution they were divided; part went with the English, part made a treaty with Congress in 1778. The Christians remained quietly at Gnadenhütten, till in 1781 the English broke it up and removed them to Sandusky. Part of them returned thither to save their crops, and were attacked by the Americans and 90 of them murdered; the rest fled mostly to Canada. Land was given them on the Thames, and they founded Fairfield, with others who came in 1787 from the Muskingum, where Congress had settled them. The wild tribesmen remained hostile, and contributed to St. Clair's defeat in 1791; but Wayne's victory forced them to make peace in 1795. Successive treaties removed them from Ohio, and by 1800 the main body were on White River, Indiana. They did not join Tecumseh in the War of 1812, and in 1818 they ceded all their lands east of the Mississippi and moved to White River, Missouri. There were then 1,800 in all, a few remaining in Ohio. Later, some went south to Red River, on the Texan border, by Spanish permission. By treaty of 24 Oct. 1829 the main body, about 1,000, settled on the Kansas and Missouri. They had schools and missions. In 1853 they sold all but a reservation in Kansas, invested the money sagaciously, and built fair houses, improved their farms, etc. During the Civil War, out of 201 warriors they sent 170 to the Union side, who proved good soldiers and guides. In 1866 their land was cut up by the Union Pacific Railroad, and they sold the whole in 1867-8, and took up lands on the Verdigris and Cane, bought from the Cherokees. A special treaty of 1866 permitted them to take lands in severalty and become citizens, they did so, and are not a "tribe" any longer, though they form a part of the "Cherokee Nation" in Indian Territory, numbering now 780. There are other bands, which in all make more than 780. They had three clans, the Turtle, Turkey, and Wolf or Munsee (q.v.); the latter, differing strongly from the rest, is in three divisions,—120 on the Thames in Canada, about 200 at Green Bay, Wis., with the Stockbridges, and some 50 with the Chippewa in Kansas. There are also 95 on the late Wichita reserve in Oklahoma, 135 on Grand River reserve in Ontario, and 350 Moravians on the Thames.

Delaware River, in the eastern part of the United States, has its rise in the Catskill Mountains in New York. It forms the boundary line for a short distance between New York and Pennsylvania, is on the whole length of the boundary line between Pennsylvania and New Jersey, and flows into Delaware Bay about five miles below Newcastle. It is navigable for vessels of the largest size to Philadelphia, 55 miles above the head of the bay, and about 120 from the ocean; for sloops to the head of the tide, at Trenton, 35 miles above Philadelphia; and for boats about 100 miles farther, though the boat navigation above Easton is very difficult. Its most important tributaries are the Schuylkill and the Lehigh. The whole length from its source to the bay is about 300 miles. The principal towns on the Delaware, besides Philadelphia, are Burlington, Trenton, and Easton.

Delaware Water Gap, Pa., village in Monroe County, on the Delaware River and the Delaware, Lackawanna & Western, the New York, Susquehanna & Western railroads; near Stroudsburg, Pa., 65 miles northwest of New York. The railroad station is called Water Gap. The place is visited annually by a number of tourists because of the remarkable channel made here by the Delaware River, where it passes through the Kittatinny Range of the Appalachian Mountains. The gorge is about three miles in length, and above the water the sides rise to the height of 1,400 feet.

Delawarr, or **Delaware**, **Thomas West**. See WEST, THOMAS, LORD DELAWARR, or DELAWARE.

Del'brück, **Martin Friedrich Rudolf von**, German statesman: b. Berlin 16 April 1817; d. there 1903. Entering public life in 1849 he was made director of the division of commerce and industry, and his part in detaching Prussia from the Austrian commercial policy was considerable. After 1862 Bismarck, then president of the cabinet, supported von Delbrück's commercial ideas, and upon the same principles he negotiated treaties with foreign powers. In 1867 Delbrück was made president of the imperial chancellery. Later he negotiated the treaties which made Germany a unit. For five years after the founding of the empire Delbrück retained his office as president of the general chancellery, now become the imperial chancellery. In 1876 he was dismissed in spite of his reputation and service. Later, as a member of the Reichstag, he dared oppose Bismarck. He retired from the Reichstag in 1881. He published 'Der Zollverein und das Tabaksmonopol' (1857); 'Der Artikel 46 der Reichsverfassung.'

Delcassé, **Théophile**, tā-ō-fēl dēl-kā-sā, French editor and statesman: b. Pamiers, France, 1 March 1852. For some time on the staff of 'La République Française' and was elected deputy from Foix 1889 and re-elected 1893 and 1898. He was under-secretary of state for the colonies and became minister for the colonies in 1894. He was minister of foreign affairs in Brisson's cabinet, holding the same office under Dupuy and Waldeck-Rousseau. He settled the "Fashoda Affair" with England and gave an eastern frontier to the possessions of France in Africa. He also concluded a commercial convention with the United States.

Deleb' Palm, the *Borassus Ethiopum*, a native of the interior and west of Africa, allied

to and somewhat resembling the Palmyra palm (q.v.). Its leaves and fruits are used by the Africans for the same purposes as those of the Palmyra by the Asiatics, and the tender roots produced by the young plant are extensively used as an article of food. The trunk is swollen about halfway up.

Delécluze, Etienne Jean, ā-tē-ēn zhōn dē-lā-klüz, French painter and critic: b. Paris 20 Feb. 1781; d. Versailles 12 July 1863. He was a pupil of David, and although achieving a fair success in painting he abandoned it for criticism 1816. He was connected with several reviews and papers, including the *Moniteur* and the *Journal des Débats*, and the *Revue des Deux Mondes*, being allied with the young literary circle of the Restoration. He also wrote several novels. Among his many works are: 'History of Painting' (1828); 'Mademoiselle Justine de Liron' (1832); 'Life and Works of Leopold Robert' (1838); 'Dona Olympia, the Sister-in-law of Pope Innocent X.' (1842); 'Gregory VII., St. Francis d'Assisi and St. Thomas Aquinas' (1844); 'Louis David, His School and His Times' (1855); and 'Souvenirs of Sixty Years' (1862). In the museum at Versailles there are some curious pen and ink sketches by him of scenes of the invasion of Paris in 1814. Among his paintings are: 'Death of Astyanax'; 'Carrying off Europa'; 'Paris Carrying off Helen'; 'Sacrifice to Ceres', and 'Augustus and Cinna.'

Delegate, a person appointed and sent by another or by others, with powers to transact business as his or their representative. The title was given to members of the first Continental Congress in America 1774. Representatives to Congress from the United States Territories are still designated by this term. They have the right of discussion, but have no vote. A delegate in old English law was one of a body of commissioners, so called because delegated or appointed by the king's commissioners under the great seal, to sit upon an appeal to the king in the court of chancery.

Delegates, Court of, the old English court of appeal, and was so called because the judges thereof were delegated, by the king's commission under the great seal, to hear and determine appeals in the three following cases: (1) Where a sentence was given in any ecclesiastical cause, by the archbishop or his official; (2) when any sentence was given in any ecclesiastical cause in the places exempt; (3) when a sentence was given in the admirals' court, in suits civil and marine, by order of the civil law. This court has been abolished, and the privy council is now the great court of appeal in all ecclesiastical causes.

Delegation, the investing with authority to act for another. Hence the name has been given to a body of persons thus deputed. Before the present Constitution of the United States of America was adopted, the persons constituting the Congress at Philadelphia were called delegates, and the body of representatives of a State in Congress are still called the delegation of a State. In Maryland and Virginia the branch of the State legislatures which, in most of the other States, is called house of representatives, has the name of house of delegates. The name of delegate is also given to the representatives sent to the Congress of the United States from

Territories not yet formed into States. In Italy branches of government are often called *delegazione*, and their members *delegati*. Formerly in Lombardy, Venice and the states of the Church the term *delegazione* was applied both to the governor and governing court of a province and to the province itself. The delegate was always a prelate, and directly appointed by the Pope.

In the civil law delegation is that act by which a debtor transfers to another person the duty to pay, or a creditor transfers to another person the right to receive payment.

Delenda, dē-lēn'da, things to be erased or expunged. *Delenda est Carthago* is the celebrated sentence with which Cato the elder was accustomed to conclude all his speeches in the Roman senate. His hatred of Carthage arose from a jealousy of its flourishing state, and the consequent danger to Rome.

De Leon, Edwin, American prose writer: b. Columbia, S. C., 1828; d. New York 1 Dec. 1891. From 1854 to 1862 he was engaged in editorial work; from 1862 to 1870 held the office of United States consul-general and diplomatic agent at Cairo, Egypt. His published works include: 'Thirty Years of My Life on Three Continents'; 'The Khedive's Egypt,' a novel; 'Askaros Kassiss, the Capt'; and 'Under the Star and Under the Crescent.'

De Leon, Thomas Cooper, American author and playwright: b. Columbia, S. C., 21 May 1839. He was auditor Topographical Engineering Bureau, Washington, 1858-61, served in Confederate army 1861-5, and at the close of the war was connected with magazine and newspaper work in Baltimore, New York and Mobile. He organized the Mobile Mardi Gras Carnival and was its manager for 25 years, and has designed carnivals for many other cities for their various celebrations. Among his works are: 'The Rock or the Rye'; 'Creole and Puritan'; 'A Fair Blockade Breaker'; 'The Puritan's Daughter'; 'Four Years in Rebel Capitals'; 'Out of the Sulphur'; 'A Bachelor's Box'; 'An Innocent Cheat'; 'Crag Nest'; 'Life of Joseph Wheeler'; and 'Confederate Memories.'

Delescluze, Louis Charles, loo-ē shārl dē-lā-klüz, French communist: b. Dreux 20 Oct. 1809; d. Paris 28 May 1871. The February revolution opened to him a career in Paris, where his clever and facile pen quickly made him popular with the rabble, but earned him from the authorities imprisonment and a fine of 10,000 francs. Again at Paris in 1853, he was sentenced to two years' imprisonment, and was next transported to Cayenne, where he remained till 1859. His experiences of his sufferings he gave in 'De Paris à Cayenne: Journal d'un Transporté' (1867). After his return he was quiet for some years, until his journal, 'Réveil,' started in 1868 to advocate the doctrines of the International, brought him anew into trouble. In the history of the Paris Commune he played a prominent part, and upon his head rests in great part the guilt of the murder of the hostages, and the burning of the public buildings of the city. He died on the last barricade.

Delessert, Benjamin, bōn-zhā-mǎn dē-lēs-sār, French naturalist and philanthropist: b. Lyons 14 Feb. 1773; d. Paris 1 March 1847. In 1803 he started cotton-spinning in France, but is particularly distinguished by his efforts to pro-

DELFT—DELHI

duce beet-root sugar. As early as 1801 he was engaged in refining, but in 1806 he began the experiments which were successfully terminated and announced to Chaptal on 2 Jan. 1812. When he heard of it Napoleon was in ecstasies: "We must see it: let us go," he said. "Delessert," says Flourens, who narrates this incident, "had just time to go to Passy, where his work was. On his arrival he found the gates surrounded by the imperial chasseurs, who refused him admittance. He told them who he was and entered. The emperor had seen and admired everything; excitement was at its height. Approaching Delessert, the emperor took the cross of the Legion of Honor from his own breast and gave it to him. It was announced next day in the *Moniteur* 'that a revolution in French commerce had been accomplished.'" Delessert lived through the collapse which the manufacture suffered after Napoleon's fall, and long enough to see it revive and become of the greatest importance.

Delft, or **Delf**, Holland, town in the province South Holland, eight miles northwest of Rotterdam. It stands on a dead flat, and is intersected in all directions by canals, which are crossed by 69 bridges, mostly of stone. These canals make the great market-place with its public buildings an island, approached by nine bridges. The counterscarps of the old ramparts are now planted with trees, and form public walks. The town-hall (*Stadhuis*), in the market-place, is a large, solid-looking building, with a heavy square tower rising from its roof. The Prinsen-hof, once the occasional residence of William I. of Orange, and the scene of his assassination, is now a military barracks. The old Reformed church contains the monuments of Admirals Tromp and Hein, the famous naturalist Leeuwenhoek, and other worthies. The magnificent mausoleum of William, and the burial-place of the Orange family, are in the new church (1412-76); and from its huge square tower the town and neighborhood are from time to time regaled with the richest music from a chime of three octaves; the new church contains also the tomb of Hugo Grotius. Delft has long been the seat of an arsenal, and was formerly the centre of the manufacture of the kind of pottery called delftware or delf. The chief manufactures now carried on comprise firearms, carpets, leather, soap, oil, and gin. In 1654 the powder magazine of the arsenal exploded accidentally, when not a single house entirely escaped, and many persons were killed or maimed. Pop. 32,021.

Delftshaven, *dëlfts-hä'vën*, or **Delfshaven**, formerly a small independent town in Holland, but included in Rotterdam (q.v.) since 1886. The place is noted as having been the point of embarkation of the Pilgrim Fathers when, in 1620, they sailed for America.

Delftware, or **Delf-ware**, a kind of pottery originally manufactured at Delft, in Holland, in the 14th century. It was among the best of its day, many examples being considered equal to the Italian in quality, but somewhat inferior in its ornamentation. It is covered with an enamel or white glazing which gives it the appearance of porcelain. The glaze of the delftware is made as follows: Kelp and Woolwich sand are calcined together, to form a vitreous mass called frit. Lead and tin are calcined to form a gray,

powdery oxide. The frit is powdered and mixed with the oxide, zaffre being added to confer blue color, arsenic for dead-white. This is fused, making an opaque enamel; ground and mixed to the consistency of cream. Delftware is made of a calcareous clay of varying color, strained, and evaporated to a plastic consistency; it is then tempered, and stored in cellars to ripen. Prolonged storage increases its tenacity and plasticity. It is then kneaded without sand; formed on the wheel, dried, and partially burned, reaching the biscuit condition. The bibulous ware is then glazed, dried, packed in saggars, which are piled in the kiln and baked.

Del'hi, India, city in the Punjab, capital of a division of the same name, and anciently of the Patan and Mogul empires; about 700 miles northeast of Bombay, and about 790 miles northwest of Calcutta. It was at one time the largest city in Hindustan, covering a space of 20 square miles, and having a population of 2,000,000. It is now reduced to a circumference of seven miles. A vast tract covered with ruins marks the extent of the ancient metropolis of the Mogul empire. The present city, built on two rocky eminences, is surrounded by walls of red sandstone 30 feet high, and from three to five feet thick, with a moat 20 feet broad. There are seven colossal arched gates, defended by round bulwarks, and all built of freestone. The streets of the old part of the city are narrow, but in the modern portion they are broad. The houses here are of sandstone and brick, and are of two and three stories in height. The palace or residence of the Great Mogul, built by Shah Jehan, commenced in 1631, and finished in 10 years, is by far the most interesting building in Delhi, and the most magnificent structure of the kind in India. The Great Mosque, a magnificent structure in the Byzantine-Arabic style, is considered by the Mohammedans the wonder of the world. It is built of white marble and red sandstone, inlaid like mosaic, in lines and arabesques; at the two extreme corners rise minarets 150 feet high, and between them two lofty domes. This imposing edifice was built by the Emperor Shah Jehan, in the 17th century, and took several thousand men for six successive years (1631 to 1637) to complete it. There are no fewer than 40 other mosques in different parts of the city, many of them having lofty minarets and gilded domes. The fine structure which stands near the Ajmeer gate was formerly the Delhi College. The famous observatory of Jye Singh, rajah of Jyepoor, at the southwest extremity of the city, has been much dilapidated, and its astronomical instruments nearly all destroyed or carried off. A monument was erected in 1888 by the government to Willoughby, one of the heroes of the siege in 1857. The principal manufactures of the town are cotton cloths, indigo, finely embroidered shawls and jewelry, for which, as well as for delicately carved ivory, Delhi is somewhat noted. The chief imports are by the northern caravans, which bring from Cashmere and Cabul shawls, fruit, and horses. Precious stones of good quality are to be had at Delhi, particularly the large red and black carnelians. The agricultural products of the district consist chiefly of wheat, rice, millet, and indigo. The trade of the neighborhood is centred in Delhi, and the Rajputana State Railroad traverses the district.

DELHI — DELIRIUM

Delhi, or as anciently called, Indraprastha, is one of the oldest cities of India. The modern name Dilli or Delhi is first met with in the 1st century B.C. It has been taken frequently by hostile powers. In the beginning of the 19th century the prosperity of the city and country around was threatened with destruction, and the Mogul emperor and royal family were reduced to poverty and distress, by the Mahrattas, who took possession of his capital, of his gardens and houses, and used his name to oppress and impoverish the people by fraud and extortion. From this miserable state of desolation and ruin the city was rescued by the British in 1803, when it was entered and taken possession of by Lord Lake. On the breaking out of the Indian mutiny in May 1857, Delhi became the centre of the operations of the rebels, who flocked to it from all quarters. The nominal representative of the Great Mogul, who held the sovereignty of the place under British protection, joined cause with the rebels; and in addition to assuming the character of an independent potentate, gave his sanction to the massacres and atrocities perpetrated on the European residents. By the middle of June a British army assembled in front of the city, and a siege commenced, which, from the smallness of the besieging force, was necessarily slow and protracted. It was brought to a successful termination on 20 September, when Delhi was entered by the British troops, and the nominal sovereignty heretofore possessed by the king was declared ended; and he himself, after being tried for the murders committed under his authority, was found guilty, and sentenced as a convict to perpetual banishment. A large part of the place was reduced to ruins in the mutiny and siege, but it has since recovered much of its former appearance, and has also been much improved in its sanitary condition. Pop. 208,385.

Delhi, N. Y., village and county-seat of Delaware County; on the Delaware River, and a branch of the New York, Ontario & Western Railroad, about 55 miles east of Binghamton. It is in one of the best dairying regions in the country, and the trade is largely in butter, cheese, eggs, and agricultural products. Pop. 2,100.

Delibes, Clément Philibert Léon, klā-môn fē-lē-bār lā-ôn dē-lēb, French composer: b. St. Germain du Val 21 Feb. 1836; d. 18 Jan. 1891. He entered the Paris Conservatoire in 1848, and in 1855 produced an operetta, 'Two Bags of Charcoal.' At the Grand Opera, where he became second director in 1865, his music for the ballet 'The Fountain' (1866), met with great success, and his ballet-music for 'Coppélia' (1870), his finest work, secured his position as a composer. He wrote music for a third ballet and for three comic operas, one of which, 'The King Said So' (1873), became very popular. In 1880 he was appointed professor in the Conservatoire.

Delilah, dē-lī'lā, the Philistine mistress of Samson. She persuaded him to reveal to her the secret of his great strength, and learning that it lay in his long and thick hair, cut off his locks while he was asleep and then treacherously delivered the helpless man into the hands of his enemies.

Delille, Jacques, zhāk dē lēl, French didactic poet: b. Aigueperse, Auvergne, 22 June 1738;

d. Paris 1 May 1813. His translation of Virgil's 'Georgics,' published in 1770, with a 'Discours Préliminaire' and numerous annotations, established his fame and obtained him admission to the French Academy. He became professor of Latin poetry in the College of France, and of belles-lettres at the University of Paris. Though an adherent of the old system, Robespierre spared him on every occasion. At his request Delille wrote the 'Dithyrambe sur l'Immortalité de l'Âme,' to be sung on the occasion of the public acknowledgment of the Deity. His reputation mainly rests on the 'Georgics' and 'Les Jardins,' a didactic poem. Other works are 'L'Homme des Champs'; 'La Pitié'; 'Les Trois Règnes de la Nature'; 'La Conversation'; 'L'Énéide de Virgile.'

Deliques'cence (Lat. "to melt away"), in chemistry the property manifested by many salts, of absorbing moisture from the atmosphere until they become distinctly damp. The name is usually applied to the more pronounced cases, in which the moisture absorbed is so copious that the salt becomes visibly wet, or even dissolves entirely; salts in which the action is less pronounced being called "hygroscopic." Carbonate of potash, caustic potash, and chlorid of calcium are familiar examples of deliquescent substances.

Delirifa'cient, any drug that induces an irritability of the brain leading to forms of delirium. Thus alcohol for some susceptible minds invariably leads to delirium in the early stages, and also induces delirium in chronic poisoning. Belladonna is a drug that causes a certain amount of delirium, as do also cannabis indica, cocaine and its allies. Opium in small doses brings about an exhilaration and for some delirium. Mescal, a drug widely used among the Indians of South America and of the southwestern United States, also induces a form of delirium. Delirifacients are rarely used in medicine for the effect on delirium.

Delirium is a temporary general disturbance of consciousness, a perversion of the intellectual and perceptive faculties, characterized by a greater or less degree of mental irritation or confusion, by more or less transitory delusions and fleeting hallucinations, accompanied by disordered, senseless speech and muttering, and motor unrest. It varies in degree from the ordinary wandering or flightiness of the lower form, to the higher, excited or more violent form, closely approaching mania.

Delirium is one of those conditions or symptoms to which the word "functional" is applicable, since it is not a disease *sui generis*. The word itself is a curious derivative from "de," from, and "lira," a ridge between two furrows. The Latin word *delirare*, signifying to deviate or wander from a straight line, figuratively—to be crazy, deranged, out of one's wits, to be foolish, to rave. Hence the term "wandering" so often associated with, and used to express, the presence of delirium. This wandering need not necessarily imply that of speech alone, for a deaf-mute or an aphasiac may become as delirious as any other person. Delirium is unquestionably experienced by dumb animals.

Continuous or chronic delirium necessarily merges into insanity; though the term delirium should not be used synonymously with insanity, even admitting that the former implies, or pre-

DELIRIUM TREMENS—DELITZSCH

supposes, an unsound mind at the time of its inception.

False beliefs, false or perverted sense perceptions, also constitute a part of the mental condition known as delirium.

Two distinct varieties of delirium are recognized (although transient forms exist), namely, the primary active or wild form, *delirium acutum*, *delirium grave*,—and the secondary or lower form. The former is not an individual affection, but a condition of varying mental disturbance which occasionally attends different states of bodily disorder such as collapse, intoxication, katatonia, etc., and often, if not altogether, dependent upon, at least associated with, demonstrable lesions of the gray matter of the brain. It is characterized by increased restlessness, in which the patient tries to escape from bed, shouts, struggles with imaginary enemies and requires physical or even mechanical restraint. This form is generally associated with alcoholics (*delirium tremens*).

The secondary or lower form is by far the most common, and less understood, the patient lying with comparative quietness but incessantly engaged in incoherent and disjointed converse with imaginary personages, or communing with his own disordered brain. It generally appears in the exanthematous diseases of children, measles, scarlet fever, etc., also in the second and third weeks of typhoid fever.

The outset of delirium may be sudden or slow. If coming slowly, the first indication of its presence may be a certain confusion and difficulty in recognizing surroundings, after awakening from sleep; the mental confusion lasting a longer period on each occasion and finally developing into a well-marked delirium. A practical point to bear in mind is that a quiet delirium may shift very suddenly into an active one.

There are innumerable causes of delirium, the more prominent ones being infectious fevers, in the young and able-bodied, diseases dependent upon some specific micro-organism, such as is seen in typhoid fever, pneumonia, scarlet fever, yellow fever, puerperal fever, pyemia, and malaria; although delirium occurs also in analogous diseases not proven directly due to any specific micro-organism, also in trauma. Surgical operations are frequently followed by delirium.

In the delirium of intoxication the causes may be divided into endogenous and exogenous, the former arising from within the body proper, such as septic intoxication, pyemic or uremic absorption, cholemia, diabetes, auto-intoxication and insolation, that is, sunstroke. The latter (exogenous) causes are alcohol, drugs, mydriatics, for example, belladonna, duboisin, atropin. Also cocaine, morphine, mineral poisons, for example, iodoform.

Delirium due to exhaustion and inanition is seen in acute anæmia, resulting from hemorrhage of any cause, or the presence in the blood of powerful hæmic poisons, for example, plasmodium of malaria. It is also due to wasting diseases and lactation.

Delirium may originate in central or peripheral lesions of the brain, for example, blood clot from accidental injury, trauma, surgical operations, meningitis or encephalitis. Delirium may also be due to, or associated with, central depression, notably that occasioned by epilepsy, hysteria major, etc.

Delirium of senility is due to inanition and pathologic changes in the cerebral vascular supply.

The delirium of disease, or acute delirium, resembles that arising during febrile diseases; it is ordinarily accompanied by rise of temperature, which pursues no definite course, and by rapid and progressive body weakness (asthenia), and the typhoid state. The treatment consists of utilizing remedial agents that rapidly produce sleep, and fighting the progressive weakness, by stimulating drugs and nutrition, quieting the motor unrest and reducing fever by hydrotherapy, etc.

Mild forms of delirium, such as occur in children suffering from measles, auto-infection from the gastro-intestinal tract, etc., require no treatment *per se*, the treatment being directed against the exciting cause. In typhoid fever and pneumonia delirium is best controlled by the ice pack or sponging with cold water and cold bath. The early inception of delirium in these fevers is a grave and dangerous symptom.

The treatment of delirium in general is first: Induce sleep, and quiet motor unrest; this is best accomplished by the reduction of fever, the exhibition of proper narcotics, thorough cleansing of the intestinal tract, and hydrotherapy. In the selection of hypnotics, the one or the group which is followed by the least depression is advisable. Hyoscamin, in sthenic cases is safe and reliable. Bromide of potash, chloral hydrate, hyoscin, morphine and opium and the various synthetic coal tar derivatives are frequently used. Second: Discover, if possible, and remove the inciting cause of delirium; to do this the pathological factor must be determined and treated accordingly.

Delirium Tremens. See DELIRIUM.

De Lisle, Charles. See LECONTE DE LISLE, C.M.R.

Delisle, Guillaume, gē-yōm dé-lél, French geographer: b. Paris 28 Feb. 1675; d. there 25 Jan. 1726. He was instructed by Cassini, and soon conceived the idea of reforming the whole system of geography. He published, in his 25th year, a map of the world, maps of Europe, Asia, and Africa, and a celestial and a terrestrial globe of a foot in diameter. By rejecting Ptolemy's statements of longitude, or rather by comparing them with the astronomical observations and the statements of modern travelers, he founded the modern system of geography.

Delisle, Joseph Nicolas, zhō-zěf nīk-ō-lä, French astronomer: b. Paris 4 April 1688; d. there 11 Sept. 1768. He was a brother of Guillaume Delisle (q.v.). Among his works are: 'Mémoires pour servir à l'histoire et au progrès de l'astronomie' (1738); 'Mémoire sur les nouvelles découvertes au nord de la Mer du Sud' (1752).

Delitzsch, Franz, German Hebraist and theologian: b. Leipzig 23 Feb. 1813; d. there 4 March 1890. He was educated in the university of his native city, became professor of theology at Rostock in 1846, at Erlangen in 1850, and in 1867 at Leipzig. His earlier works dealt with post-biblical Jewish literature, and he afterward wrote commentaries on various books of the Old Testament. He was also the author of numerous theological and devotional works, among which were 'Biblico-prophetic Theology' (1845); 'The House of God' (1848); 'Biblical

Psychology' (1855); 'Jesus and Hillel' (1867); 'Christian Apologetics' (1869). He was chiefly eminent as a commentator on the Old Testament, and his honesty as a theologian was shown in the concessions he was willing to make (in the last edition of his commentaries on Genesis and Isaiah, 1887) to the latest critical views of the Pentateuch.

Delitzsch, Friedrich, frēd'rīh dā'lich, German Assyriologist: b. Erlangen, Bavaria, 5 Sept. 1850. He is a son of Franz Delitzsch (q.v.). He has published among other works: 'Assyrian Studies' (1874); 'Where is Paradise?' (1881); 'Prolegomena of a New Hebrew and Aramaic Vocabulary to the Old Testament' (1886); 'Assyrian Vocabulary' (1887 onward); 'Assyrian Grammar' (1889); 'Assyrisches Handwörterbuch' (1894-6); 'Das Babylonische Welterschöpfungsepos' (1896); and a translation of George Smith's 'Chaldean Account of Genesis.' In 1877 he became extraordinary professor in Leipsic, ordinary professor at Breslau in 1893, and in 1899 professor of Assyriology in the University of Berlin.

Delitzsch, Germany, a town of Prussian Saxony, on the Lösser, 15 miles north of Leipsic. The manufactures are chiefly woolen goods; several important fairs are held each year. Pop. 9,560.

Delius, dā-lē-oos, Nikolaus, German Shakespearian critic: b. Bremen 19 Sept. 1813; d. Bonn 18 Nov. 1888. He studied philology at Bonn and Berlin, and in England and France. He settled in 1846 in Bonn, where he became extraordinary professor in 1855, and professor in 1863. He published a critical edition of Shakespeare (1854-61).

Delivery, in law (1) the delivery of a deed, or the handing of it over to the grantee, which is expressed in the attestation, "sealed and delivered," and is one of the requisites to a good deed. A deed takes effect only from this delivery; for if the date be false or impossible, the delivery ascertains the time of it. A delivery may be either absolute, that is, to the grantee himself, or to a third person, to hold till some conditions be performed on the part of the grantee. In certain cases, as wills, bonds made by a parent in favor of his children, or deeds in which the grantee has himself an interest, or where there is a mutual obligation between the parties delivery is not required. (See DEED.)

(2) An expression peculiar to England, also called jail delivery, a term applied to the sessions at the Old Bailey, London, or the assizes, when the jail is delivered or cleared of the prisoners.

Delivery. See OBSTETRICS.

Della Crusca, dēl'la krūs'kanz, a coterie of English poetasters resident about 1785 in Florence (and so named from the Accademia della Crusca of that city), who took to penning verses, which they published under the name of the 'Florence Miscellany.' Notwithstanding the inconceivable silliness and affectation of these productions they found numerous admirers. The newspapers of the day began to give publicity to their lucubrations. Genuine poetry seemed for a time at a discount, and nonsense and Della Crusca prevailed. The frenzy was, however, of short duration. The 'Baviad' (1794) and 'Mæviad' (1796) of William Gifford swept the butterfly Orlandos, Carlos, Lauras, Marias, "and

a thousand other nameless names" into merited oblivion.

Della Maria, Dominique, dōm-ē-nēk dē-lā mā-rē-ā, French musician: b. Marseilles 1768; d. Paris 9 March 1800. He was very precocious, but his fame rests upon the score he wrote for 'The Prisoner' by Duval.

Della Robbia, Luca. See ROBBIA, LUCA DELLA.

Della Robbia Ware, brown terra-cotta bas-reliefs thickly enameled with tin-glaze; made at Florence (chiefly in 1450-1530); in France (1530-67); so called from the name of the artist and its attributed inventor, Luca Della Robbia. The most important and largest work in this ware, perhaps, is the frieze on the hospital at Pistoia, made after the artist's death. At Tamworth, England, there is a plant, founded in 1847, that turns out this style of pottery, especially for architectural decorations, with great success.

Dellys, dēl-lēz', Algeria, a seaport in the department of Algiers, 49 miles east of the city of Algiers. The inhabitants are mostly French and Arabs. It contains the mosque of the Mohammedans and the mission school of the Christians. The trade is principally in grain, oil, and salt. Pop. 3,987.

Delmar, Alexander, American political economist: b. New York 9 Aug. 1836. He established the 'Social Science Review' and was its editor in 1864-6. He is the author of 'Gold Money,' and 'Paper Money' (1862); 'Essays on Political Economy' (1865); 'Letter on the Finances' (1868); 'History of Money in Ancient Countries' (1884); 'The Science of Money'; 'The National Banking System'; 'Statistical Almanac'; 'The History of Money in America' (1899); etc.

Delmonte y Tejada, Antonio, ān-tō'nē-ō dēl-mōn'tā ē tā-hā'dā, Dominican historian: b. Santiago de los Caballeros, Santo Domingo, 29 Sept. 1783; d. Havana 19 Nov. 1861. He is the author of 'Historia de Santo Domingo' (1853), a history of the island from its discovery.

Delolme, Jean Louis, zhōn loo-ē dē-lōlm, Swiss writer: b. Geneva in 1740; d. Switzerland 16 July 1806. He at first practised as a lawyer in his native city, but the part which he took in its internal commotions obliged him to go to England, where he passed some years in great poverty. He became known by his once-celebrated but superficial 'Constitution de l'Angleterre,' translated by the author himself into English in 1772. Delolme also published in English his 'History of the Flagellants or Memorials of Human Superstition' (1783); an 'Essay on the Union with Scotland' (1796). He returned to Switzerland about 1775.

De Lome, Enrique Dupuy, ēn-rēk' dū pwē' dē-lōm, Spanish diplomatist: b. Valencia, Spain, August 1851. He became first secretary of the Spanish legation in Washington in 1882, and minister to the United States in 1892 and 1895. In February 1898 it was discovered by the authorities in Washington that he had written a letter to Señor Canalejas, a Spaniard of high rank who had been in the United States a short time previous supposably to make observations for the Spanish government. The letter, which followed Canalejas to Havana, and was

probably abstracted from his apartments there by some friend of the insurgents, contained disparaging phrases regarding the President of the United States, and otherwise plainly showed that neither the writer nor the recipient of it believed that Spain was acting in good faith with the United States government. De Lome at first denied the genuineness of the letter, but it was proved beyond a doubt that he was the author, and he telegraphed his resignation to Madrid on February 9.

De Long, George Washington, American naval officer and Arctic explorer: b. New York 22 Aug. 1844; d. Siberia 30 Oct. 1881. Graduating from the Naval Academy in 1865, he reached the grade of lieutenant-commander, and perished of cold and exposure while in command of the *Jeannette* Expedition in 1879-81. His journals have been published, entitled 'The Voyage of the *Jeannette*' (1883); and the story of the search for the survivors is told in Melville's 'In the *Lena Delta*' (1884).

Deloo', an African antelope, one of the duiker-bok (q.v.).

Delorme, Marion, mā-rē-ōñ dē-lōrm, French courtesan: b. Blois 3 Oct. 1613; d. Paris 2 July 1650. Her beauty and wit soon made her house the rendezvous of all that was gallant and brilliant in Paris. The king, the princes of Condé and Conti, Buckingham, Cinq-Mars, St. Evremont, were among her admirers. The leading spirits of the Fronde regularly assembled in her house, and she is said to have assisted them in their enterprises. Mazarin was about to have her arrested when she died suddenly. The legend arose in France that the death and funeral were a mere pretense, got up to permit her to make her escape. She is said to have crossed over to England and married a rich lord, who shortly afterward died. She then returned to France, married a chief of brigands, who was captivated by the charms of his victim. After his death she married a procurator of finance in Franche-Comté, with whom she spent 22 years of her life. Upon his death prosperity forsook her. Plundered by adventurers and her own servants, she died in extreme poverty in 1706, or according to another story in 1741, at the age of 129 years. Victor Hugo has taken her as the subject of one of his dramas.

De l'Orme, Philibert, fē-lē-bār, French architect: b. Lyons 1515; d. Paris 8 Jan. 1570. He studied in Rome, aided by Cardinal de Ste. Croix, and became the favorite architect of Henry II. and Diane de Poitiers. On the death of Henry II. he remained in disfavor for some time. He began the Tuileries for Catharine de Medici. The Château d'Anet, begun in 1552, is one of his chief works. He wrote two books which were long a high authority on architecture.

Delorme, Pierre Claude François, pē-ār klōd frān-swā, French genre painter: b. Paris 28 July 1783; d. there 8 Nov. 1859. He was a pupil and imitator of Girodet. Among his works are: 'Death of Abel' (1810); 'Hero and Leander' (1814); 'Raising of Jairus' Daughter' (1817), in Church of St. Roch, Paris; 'Christ Reappearing' (1819), in Notre Dame, Paris; 'Cephalus Carried Off by Aurora' (1882), in the Luxembourg; 'Hector Reproaching Paris' (1824); 'Sappho Reciting an Ode to

Phaon' (1833); 'Eve Plucking the Forbidden Fruit' (1834); 'Magdalen at the Sepulchre' (1835); 'Adam and Eve After the Fall' (1839); 'Holy Family in Egypt' (1850).

Delort, Charles Edouard, shārl ā-doo-ār dē-lōr, French painter: b. Nîmes 4 Feb. 1841. He was a pupil of Gleyre and of Gérôme. Among his works are: 'Daphnis and Chloe'; 'The Stolen Cattle' (1866), Museum of Nîmes; 'Confidence'; 'Starting for the Chase' (1873); 'Marauders' (1874); 'Embarking of Manon Lescaut' (1875); 'After Breakfast' (1876); 'A Poacher'; 'Admonition' (1880); 'Capture of the Dutch Fleet by the Hussars of the French Republic' (1882); and 'Return from Exile' (1889).

Delos, dē'lōs (ancient ASTERIA; CYNTHUS; ORTYGIA), the central and smallest island of the Cyclades, in the Aegean Sea, a rugged mass of granite about two square miles in extent. Delos, according to old legends, was raised from the sea-bottom by Poseidon. It was then a naked rock floating about in the ocean, and was accidentally driven by the waves into the centre of the Cyclades. The Earth had promised Hera (Juno), with an oath, not to grant a resting-place to the fugitive Latona where she might be delivered. The unhappy goddess wandered restlessly over the earth until she perceived the floating island. As this was not stationary, it was not comprehended in the oath of the Earth, and offered her an asylum. Here Latona bore the infant gods Apollo (who was hence called *Delios*) and Artemis (who was called *Delia*). Both were worshipped on this island. Delos was thenceforth no longer the sport of the winds; it was moored to the bottom of the Aegean with adamantine chains by Zeus, and the fame of the isle spread over the world. Thus far mythological tradition.

At an early period the island, occupied by the Ionians, had kings of its own, who also held the sacerdotal office. In the course of time it came under the dominion of Athens. In 477 Delos became the common treasury of the league against Persia, but the money was afterward transferred to Athens. In 426 the Athenians purified Delos by removing all the tombs, and thenceforth they prohibited births and deaths from taking place on the island. In 422 they removed all the Delians from the island in order to complete its purification, but soon afterward these were allowed to return. After the destruction of Corinth the rich Corinthians fled thither, and made Delos the seat of a flourishing commerce. Delos had a famous temple of Apollo, built of Parian marble, and containing, besides the beautiful statue of the god, a remarkable altar, from which the Delian problem (Doubling the Cube), as it is called, had its name. The inhabitants, having consulted the oracle concerning the remedy of a plague which raged in Delos, were ordered to double the altar of Apollo, which was a cube. A solution of this problem of the duplication of the cube was attempted in different ways by several of the ancient mathematicians. The Grecians celebrated the Delian festival here every five years; and the Athenians performed annually the pilgrimage called *theoria*, with processions and dances. Delos was celebrated in ancient times for the number and the excellence of its artists, and workers in silver and bronze. Cicero, in his

oration for Roscius, has many eulogiums upon the fine vases of Delos and Corinth. Delos, called Dili or Sdili, is now without permanent inhabitants; a few shepherds from the neighboring islands pay it summer visits with their flocks. Some ruins of its former magnificence yet exist. Among these are remains of the Temple of Apollo above referred to, of one to Latona, of an amphitheatre, etc., besides a curious primitive temple of Apollo, called the Cave of the Dragon, which is not a real cave.

Since 1877 the French School at Athens has been making excavations on the island of Delos, largely under the direction of Théophile Homolle. The procedure has been slow and economical and the results excellent. Homolle, who previously carried on excavations at Delphi, was appointed by President Loubet director of the Louvre Museum. According to the report made to the Institut de France by Prof. Dürbach, Delos is the only ancient Greek city that remains approximately intact. It may almost be termed the Greek Pompeii in view of the scientific results which it has yielded. The complete plan of the sacred precinct of Apollo has been recovered; together with the theatre, the temple on Mount Cynthus, the temples of foreign gods, and an extensive part of the commercial section of Hellenistic and Roman days. Sculpture of all periods has been found in abundance, as well as inscriptions throwing light on various points of discussion. Joseph Florimund, Duc de Loubat (Papal nobility), an American, placed at the disposal of Homolle a yearly sum of \$10,000 to continue until the excavations are finished.

From the ancient mole, there is an approach to the precinct of Apollo through an avenue flanked by porticoes. The temple of Apollo is the centre of the precinct. It is a Doric work, with 13 columns at either side, and 6 in front and rear; and having comparatively few sculptural decorations. It dates from the early 4th century B.C. The decorative groups on the two gables have been in part recovered, and are now in the National Museum, Athens. To the north of the precinct of Apollo are large remains of the commercial Delos. In the 2d and 1st centuries B.C., Delos was the chief commercial town of the eastern Mediterranean. The most extensive building in this region is a kind of exchange, with a very large court encircled by apartments. The shore, facing Rhenea, is lined with docks and warehouses. A well of six metres in depth was found filled with tablets of marble and bronze, having upon them 20 ancient inscriptions regarded as of great value. The sanctuaries contain exvotos, stelæ, and inscriptions on marble and bronze giving in full detail accounts of the high priests and catalogues of the offerings brought by pilgrims. Streets, gardens, and sewage canalization may all be distinctly traced. Interesting private houses have also been discovered. Mention should also be made of the long and narrow hall, extending north and south and entered through a portico at its southern end, having at its northern end the famous "altar of horns," composed of the horns of the victims and accounted one of the seven wonders of the world. The entire building is often called "The Sanctuary of the Bulls," from the design of the capitals of the two columns separating the altar from the remainder of the hall. Consult Homolle, 'Les Archives de l'Intendance Sacrée de Délos'; Diehl, 'Ex-

cursions in Greece' (Eng. trans. by Perkins 1893); 'Bulletin de Correspondance Hellénique' (1877).

Del'phi, the seat of the most famous oracle of ancient Greece, was situated in Phocis, on the southern side of Parnassus. Apollo, according to fable, having killed the serpent Python, and determining to build his sanctuary here, perceived a merchant vessel from Crete sailing by. He immediately leaped into the sea in the form of an immense dolphin (Greek, *delphis*), took possession of the vessel, and forced it to pass by Pylos, and to enter the harbor of Crissa, not far from Delphi. After the Cretans had landed he assumed the figure of a beautiful youth, and told them that they must not return to their country, but should serve as priests in his temple. Inspired, and singing hymns, the Cretans followed the god to his sanctuary on the rocky declivity of Parnassus; but, discouraged by the sterility of the country, they implored Apollo to save them from famine and poverty. The god, smiling, declared to them the advantage which they would derive from serving as his priests. They then built Delphi, calling the city at first Pytho, from the serpent which Apollo had killed at this place.

The oracles were delivered from a cave called Pythium. Tradition ascribes its discovery to a shepherd who pastured his flocks at the foot of Parnassus, and was filled with prophetic inspiration by the intoxicating vapor which arose from it. Over the cave, which was contained in a temple, was placed the holy tripod, upon which the priestess called Pythia, by whose mouth Apollo was to speak, received the vapors ascending from beneath, and with them the inspiration of the Delphian god, and proclaimed the oracles (hence the proverb, to speak *ex tripode*, used of obscure sentences, dogmatically pronounced). After having first bathed herself, and particularly her hair, in the neighboring fountain of Castalia, and crowned her head with laurel, she seated herself on the tripod, which was also crowned with a wreath of the same, then, shaking the laurel tree and eating perhaps some leaves of it, she was seized with a fit of enthusiasm. Her face changed color, a shudder ran through her limbs, and cries and long protracted groans issued from her mouth. This excitement soon increased to fury. Her eyes sparkled, her mouth foamed, her hair stood on end, and almost suffocated by the ascending vapor, the priests were obliged to retain the struggling priestess on her seat by force; then she began, with dreadful howlings, to pour forth detached words, which the priests collected with care, arranged them, and delivered them in writing to the inquirer. At first the answers were given in verse, or were put into hexameters by priests of the temple who were poets, but in later times, the authority of the oracle being diminished, they contented themselves with delivering them in prose.

This oracle was always obscure and ambiguous; yet it served, in earlier times, in the hands of the priests, to regulate and uphold the political, civil, and religious relations of Greece. It enjoyed the reputation of infallibility for a long time; for the Dorians, the first inhabitants of the place, who soon settled in all parts of Greece, spread an unbounded reverence for it. At first only one month in the year was assigned for the

DELPHI — DELPHIN CLASSICS

delivery of oracles; afterward, one day in each month; but none who asked the god for counsel dared approach him without gifts. Hence the splendid temple possessed immense treasures, and the city was adorned with numerous statues and other works of art, the offerings of gratitude. Delphi was at the same time the bank in which the rich deposited their treasures, under the protection of Apollo, though this did not prevent it from being repeatedly plundered by the Greeks and barbarians. Although the sanctuary and its treasures had been almost miraculously preserved from the Persians and Gauls, they were forced by Sulla to contribute to the payment of his soldiers, and Nero removed 500 brazen images from the sacred precincts. Constantine the Great enriched his new city by the sacred tripods, the statues of the Heliconian Muses, the Apollo, and the celebrated Pan dedicated by the Greek cities after the conclusion of the war with the Medes.

The ancients believed Delphi to be the centre of the earth: this, they said, was determined by Jupiter, who let loose, from the east and from the west, two eagles, which met here. The tomb of Neoptolemus (or Pyrrhus), son of Achilles, was at Delphi, and near it the famous Lesche, adorned by Polygnotus with the history of the Trojan war. In the plain between Delphi and Cirrha the Pythian games were celebrated. These national games, and the protection of the Amphictyons, gave Delphi a lasting splendor. It is now a village called Castri, near which the Castalian spring may still be seen.

In 1892 the site of Delphi, until that time occupied by the village of Castri, was purchased by the French government, a new village was established farther westward, and the French School at Athens, under the direction of Théophile Homolle, began important excavations. The entire precinct has been revealed, and, with the assistance of Pausanias' 'Itinerary,' many structures have been identified, including the altar, temple, stadium, theatre, treasuries, and other buildings. More than 3,000 inscriptions have been found, many of great value for Grecian history. The sculpture discovered contributes much to the history of art in the late 6th and early 5th century B.C. The ancient wall (the Hellenico), extending east and west, has been recovered in its entire length, and the two boundary walls, climbing the hill at either end of the Hellenico, have been traced. The main entrance was in the eastern of these two walls, and from this the Sacred Way proceeds by a zigzag course to the temple. Just within the precinct wall, on the northern side of the Sacred Way, stood the large building dedicated as an offering by the Lacedæmonians after the battle at Ægospotamos (q.v.). To the west, on the southern side of the way, was the Sicyonian treasury, in the form of a Doric temple, distyle *in antis*. Still farther westward, on the same side of the way, is the Cnidian treasury, originally a small marble Ionic temple, distyle, with a sub-structure of tufa. The sculpture from the pediment and frieze of this building, and the fragments of moldings, are of very considerable interest. The structure has been described as perhaps the most nearly perfect extant example of the transitional style of the early 5th century B.C. Here the Sacred Way makes a decided turn; and farther north, but still on the same side of the way, is the Athen-

ian treasury — a Doric temple *in antis*, of small size, with a basis bearing the remains of a dedicatory inscription which announces that it was built with the spoils from the battle of Marathon (q.v.). It was on stones in this treasury that the hymns to Apollo with ancient musical notation were found. Beyond this treasury was the many-fluted "Column of the Naxians," which supported the colossal marble sphinx, now in the museum.

The site of the temple shows the remains of various successive buildings. Many remains have been recovered of that built by the Alcmaeonids (6th century), which was destroyed by an earthquake. Some archaic sculptures discovered have been assigned to the gables of this structure. The foundations now extant are those of the temple built in the 4th century. No definite information can be gained as to the oracle. The theatre, in the northwest corner of the precinct, dates from the early 2d century and is one of the best preserved in all Greece. The walls and seats of the auditorium remain; there are 33 tiers of seats arranged in seven sets, with a paved longitudinally-intersecting passage, or diazoma. Consult the 'Bulletin de Correspondance Hellénique,' and the 'Comptes Rendus de l'Académie des Inscriptions.'

Delphi, Ind., a city of Carroll County, of which it is the county-seat, about 20 miles southwest of Logansport, and 60 miles north by west of Indianapolis; on the Wabash River and the Louisville, New Albany, and Chicago, the Wabash, and other railways. The water-power is excellent. There are lime-works, the lime interests being extensive; besides paper-mills, wagon and carriage manufactories, flour and planing-mills, and a bent-wood factory. Pop. (1890) 1,923; (1900) 2,135.

Delphin (del'fin) **Classics** (*Auctores Classici in usum Serenissimi Delphini*), a collection of the works of the Latin classic authors, prepared by order of Louis XIV., at the suggestion of the Duke of Montausier for the use of the dauphin of France. The Duke of Montausier was the dauphin's governor, and in making a selection of authors, texts, and editors, employed the services of Bossuet, "the Eagle of Meaux," and Huet, bishop of Avranches, both preceptors to the young prince. This collection of the Latin classics does not comprise all the works of Latin writers that are extant, and it contains a few authors to whom the title classic can be given only by a very generous interpretation of the word. A notable omission of a genuine classic is the 'Pharsalia' of Lucan, which seems to have been dropped, as having no place in the library of the heir of an absolute monarch. The series was completed in 64 volumes 4to, including a 'Dictionary of Antiquities' in one volume. The text is accompanied by copious explanatory notes (in Latin), and, in the case of all poets and of difficult prose writers (Tacitus, for instance), by an interpretation in easier Latin. The same is done in the case of all difficult phrases occurring anywhere in the prose authors. The complete works of the several classics, as far as extant, are given; as well as the spurious works commonly attributed to them. A valuable feature of this collection is the very complete verbal index to the works of each author. In the years 1819-30

DELPHINE—DELTA

Valpy, of London, republished the *Delphin Classics*, with the whole of the notes and interpretations, but usually with the texts as amended by later critical research. To the notes of the *Delphin* edition Valpy added very voluminous *Nota Variorum*. These last far exceed in bulk both the text and notes of the original *Delphin Classics*.

Delphine, děl-fën, a romance by Madame de Staël, published in 1802. Its bold imagery, keenness of observation, and power of impassioned description, perhaps justify 'Delphine's' position among the masterpieces of French literature. But neither situations nor characters are true to nature. The romance had a special interest for Madame de Staël's contemporaries, for several of the great men and women of the time appear in it under the thinnest of disguises. As in the case of "Corinne," the liberal ideas scattered through the story drew down on the author the anger of Napoleon, who ordered her to leave France.

Delphin'ia, a festival celebrated in honor of Apollo (Delphinios being one of his names) at Athens, on the 7th of the month Munychion (April). On this occasion a procession of girls bearing garlands, marched to the temple of the god to seek his favor more especially, perhaps, in the interests of seamen.

Delphin'idæ, the dolphin family of cetaceans. See DOLPHIN; NARWHAL; PORPOISE.

Delphin'ium, a genus of beautiful annual and perennial plants of the crowfoot family (*Ranunculaceæ*), with large irregular flowers, comprising about 60 species, natives for the most part of the north temperate zone; some few species are found in the mountains of Mexico. The name is a reference to the supposed resemblance to a dolphin. The genus is represented in America by about 25 species, which are known as larkspur, with blue or purple flowers, rarely white. The field larkspur (*D. consolida*) is found in waste places in southern New Jersey, Pennsylvania and farther southward, naturalized from Europe. It has for a companion at times (*D. Ajacis*) the cultivated larkspur, which has escaped from gardens. The cultivated plants have shorter spurs and longer and denser racemes of flowers. The tall larkspur (*D. urecolatum*) is found in the woods of central Pennsylvania, west to Minnesota, south to Nebraska, northern Alabama, and North Carolina. Other species extend the habitat of the genus, north to Manitoba and south and west to Texas. From the European (*D. staphisagria*, stavesacre) is extracted an alkaloid known as delphinine. The field larkspur is a simple astringent.

Delphinus, děl-fr'nūs (the dolphin), one of Ptolemy's original 48 constellations, situated between Vulpecula, Pegasus, Equuleus, Aquarius, and Aquila. It has no stars brighter than the third magnitude. The names Sualocin and Rotanev assigned to its stars Alpha and Beta, are merely reversals of the name Nicolaus Venator, an astronomer's assistant, who wished to commemorate himself.

Delphos, Ohio, city in Allen and Van Wert Counties, situated on the Miami & E. C., the N. O., the Pittsburg, Ft. W. & C., and other railroads; about 70 miles southwest of Toledo. The principal industries of the city are the Fort Wayne railroad repair shops,

and manufactures of furniture and wooden ware. Pop. (1900) 4,517.

Del Rio, děl rê'ô, Texas, county-seat of Vel Verde County; about five miles from the Rio Grande River; on the Southern Pacific Railroad. Its industries are those of an agricultural and stock-raising region, and it has several small cotton and wool manufacturing plants. Pop. (1900) 2,500.

Delsarte, François Alexandre Nicolas Chérie, frän-swä ä-lëks-ändr nîk-ô-lä shâ-rê děl-särt, French educator: b. Solesmes 19 Dec. 1811; d. Paris 19 July 1871. He attained distinction as a tenor singer in the Opéra Comique, suddenly lost his voice, and thereafter applied himself to musical and dramatic instruction, having among his pupils many who afterward achieved operatic and dramatic celebrity. He was author of several melodies and romances, but his chief work was the elaboration of a system of dramatic expression, by which the voice and entire action of the body were trained by fixed rules. He aimed to make elocution a science. His system, at least in part, has of late been gaining many adherents among elocutionists.

Delsarte Method. See GYMNASICS.

Delta, the name of the fourth letter of the Greek alphabet, the capital form of which is an equilateral triangle. The name is also applied to a tract of land triangular in shape, generally formed by the deposit of river sediment, especially at the mouths of rivers which flow into lakes or seas. A mountain stream changing the force and rapidity of its current upon entering a level plateau deposits at the base of the mountain sediment which assumes the triangular form and is called a cone-delta or a fan-delta, or an alluvial fan.

The nature of the current in the body of water receiving the river deposit has much to do with the size of the delta. A swiftly-flowing current or high tides carry off the deposit from the shore line, sometimes forming long coast islands or sand-bars or sand-spits, or distributing the sediment over the ocean bed; but slowly moving waters are conducive to large deltas. The almost tideless Mediterranean and Gulf of Mexico have deltas at the mouths of the large rivers which bring deposits to the sea. Usually the finest particles of land waste are swept away by currents, but the rest accumulates at the mouth of the river and builds up a fan-shaped land mass, or delta, in front of the old shore line. Old rivers that bring down much sediment, may, if the coast is neither uplifted nor depressed, build deltas of great size. In the case of a river emptying into a sea even the fine waste brought down falls to the bottom before long, as the salts in the sea water precipitate matter in suspension. The river usually enters the sea over the front of its delta by several channels, these branches of the main stream being called distributaries. An excellent example is the way the Mississippi divides up at its mouth. As a large river bringing down waste can build a delta even where waves and tidal currents are active in distributing the material, the absence of a delta at the mouth of a large river indicates generally some recent change of level. Thus the absence of deltas along the Atlantic coast of the United States is due to a slow depression of the coast, still in progress. This submergence of the coast has

DELTA METAL—DELUGE TABLET

a tendency to create estuaries at the mouths of rivers. Some notable deltas are those of the Po, Hoangho, Ganges, and Niger. As showing how rapidly a delta may grow, Adria in Italy was a seaport in the time of Augustus, but the growth of the Po delta has left it 20 miles inland. The Mississippi delta is advancing into the Gulf of Mexico at the rate of one mile in 16 years. The Mississippi delta is, in area, about 12,500 square miles; that of the Nile about 10,000 square miles. Large rivers frequently change the channel of their distributaries, thus making the deltas unsafe for dwelling places. Consult: Geikie, 'Elementary Lessons in Physical Geography,' and 'Text Book of Geology'; Tarr, 'Physical Geography.'

Delta Metal, an alloy containing 56 parts of copper, 42 of zinc, and 2 of iron. It is said to be as strong as mild steel, over which it has the advantage of not rusting by exposure to the weather. Delta metal is largely used in England and Germany, and is also employed in the United States, though to a more limited extent.

Delta Territory, Venezuela, the delta of the Orinoco River, bounded on the north and east by the Gulf of Paria, the Atlantic Ocean, and British Guiana; on the south by the Yururari territory; on the west by the Maturin section of the old state of Bermudez (now divided into states of Barcelona and Sucre). Its numerous streams and low-lying coasts are not well adapted to navigation of large vessels. Pedernales, a small town on the Gulf of Paria, is the capital. Pop. of territory about 2,500.

Deltoid Muscles. See **MUSCLES**.

Deluc, Jean André, zhōñ ān-drā dē-lūk, Swiss geologist and meteorologist: b. Geneva 8 Feb. 1727; d. Windsor, England, 8 Nov. 1817. He passed the first half of his life in commercial pursuits. In 1773, obliged by commercial disaster to quit his native city, he went to England, was elected a Fellow of the Royal Society of London, and appointed reader to the queen, a situation he held for 44 years. He made numerous geological excursions in central Europe and in England, of which he has published accounts. He enriched science with very important discoveries. Among his numerous writings are his 'Recherches sur les Modifications de l'Atmosphère' (1772); 'Nouvelles Idées sur la Météorologie' (1786); 'Traité élémentaire de Géologie' (1810).

Deluge (through the French, from Lat. *diluvium*, "a flood"). There is scarcely any considerable race of men among whom there does not exist, in some form, the tradition of a great deluge, which destroyed all the human race except their own progenitors. The classical story of Deucalion and Pyrrha is but a typical example of similar myths found everywhere, and savages and fathers of the Church alike have argued that the shells, corals, and other marine objects often found on the tops of mountains, offered distinct proof of the historical reality of a deluge. That the Noachian deluge recorded in Scripture covered the whole earth and destroyed all mankind save one family, was the universal opinion until toward the close of the 18th century. The organic remains, on which the science of palæontology is now founded, were regarded as its wrecks, and were held to prove that it had covered every known country, and risen over the highest hills. In the progress of geol-

ogy, it soon became evident that most of the stratified rocks demanded an earlier origin than a few thousand years, and the influence of the deluge was consequently restricted to the slightly altered superficial deposits; but many of these were, after a few years, found to belong to a period vastly anterior to any historical epoch, and to have been produced by long-continued and persistent agencies, differing totally from a temporary cataclysm. The more common modern opinion regards the flood of Noah as partial and local, although the universality seems fairly enough to be implied in the biblical description, and although the old theory has been revived by writers of some authority, other noted men have argued and maintained the partial character of the flood from the absence of all record of a deluge among the black races of the world, as the negroes and Papuans, asserting that this opinion is quite consistent with the exegesis of Scripture, with tradition, and the doctrine of the Church, while it is the only theory that avoids all the ethnological and linguistic difficulties presented by the existence of the great negro and yellow races marked off so distinctly from the Noachian type. The deluge traditions of many primitive races are connected with religious mysteries, and it is scarcely true, as has often been asserted, that it is the Old Testament alone that gives a moral reason for the deluge sent upon the world. The Chaldean account discovered by George Smith presents a striking resemblance to the Genesis story, and agrees with it also in making the flood distinctly a divine retribution for human sin, although it of course differs from the Jewish account in being polytheistic instead of monotheistic. The vessel in which Xisuthros, the Chaldean Noah, sails, is a ship guided by a steersman, and others beside his own family are admitted into it. The flood is seven days at its height, and Xisuthros sends out in succession a dove, a swallow, and a raven. The ship finally rests on Rowandiz, the highest mountain of eastern Kurdistan, and the peak which supports the heavens, instead of upon Ararat, the northern or Armenian continuation of the range. Babylonian tradition also confounds Noah with Enoch, for Xisuthros is taken to the skies immediately after coming out of the ark. Two deluge poems were amalgamated together in an Akkadian epic, in 12 books, describing the adventures of Gizdhubar.

Bibliography.—Buckland, 'Reliquiæ Diluvianæ'; Howorth, 'The Mammoth and the Flood'; Lenormant, 'Histoire Ancienne de l'Orient'; Motais, 'Le Déluge Biblique.' Compare: Sayce, 'Fresh Light from the Ancient Monuments'; Prestwich, 'On Certain Phenomena Belonging to the Close of the Last Geological Period.'

Deluge Tablet, or Deluge Tablets, the name given to the tablet or tablets (the 11th of the Izdubar Legends) inscribed with cuneiform writing, which being translated is found to contain the Chaldean account of the deluge. Perhaps it may have been originally Acadian. A paper on the subject was read by George Smith, of the British Museum, before the Society of Biblical Archaeology, on 3 Dec. 1872, and a revised translation published in 1874. What Mr. Smith called the Flood-hero was Adra-hasis. In Babylonian proper names compounded of two elements, either might at pleasure be placed first.

Reversing the relative positions of the two elements, the name becomes *Hasis-adra*, which being imperfectly heard by the Greeks was by them written *Xithurus* or *Xisuthrus*.

Delun'dung (native name), the *linsang* or weasel-cat (*Prionodon gracilis*), a small quadruped inhabiting the vast forests of the eastern extremities of Java and Malacca. It is of pale yellowish-white color, with elegantly marked stripes and bands of a deep brown. It is allied to the civets, but is destitute of a scent-pouch.

Delusions. A delusion is a mental state in which the mind, reasoning from definite facts, arrives at erroneous, undemonstrable, and perhaps foolish conclusions, and is unable to modify these conclusions, whatever proof may be brought to show their falsity. Thus a patient suffering from delusions may read into the actions of others ideas and conclusions relating to himself that have no basis in actual logic. Seeing several people on a corner, a man with persecutory delusions may infer that they are gathering to do him harm; hearing people talking, he imagines they are talking about him, and planning to deprive him of his liberty, his money, his life, etc. See **INSANITY**.

Delyannis, *dēl-i-ān'is*, **Theodoros**, Greek statesman: b. Kalavryta, Peloponnesus, 1826. He entered politics early in life and in his long career has held many cabinet positions. While prime minister for the third time, 1895-7, he brought about the Greco-Turkish war, whose disastrous result obliged him to resign with his whole cabinet.

Demades, *dēm-ā'dēz*, Athenian orator: d. 318 B.C. Originally a fishmonger, he rose to high places in the republic. He was captured by Philip of Macedon in the battle of Chæronea, but soon set at liberty. He afterward exerted his influence in favor of the Macedonian party at Athens, but betraying Antipater, was put to death by Cassander, the son of the latter.

Demagogue (Gr. *demagogos*), one who leads or directs the people in political matters. In its original acceptation it was considered an honorable designation, and in this sense Pericles, Demosthenes, and Cicero were demagogues. On the other hand, the tanner, Cleon, satirized by Aristophanes in his play of the 'Knights,' is a portrait of the personage to whom the epithet in its bad sense is applied. It is a handy nickname to throw at a popular politician with whose views you have no sympathy. Usually an unprincipled orator or political agitator who curries popularity and power with the masses by pandering to their ignorance or prejudice.

Demand, a term in law, of comprehensive meaning. When referred to contracts it means a claim, a legal obligation. Its correlative is release, and a release of all demands is a release of all covenants real and personal, whether the conditions are broken or not, of all annuities, recognizances, obligations, and contracts. Demand, in the practice of law, is a requisition made by one individual to another to do a particular thing, namely, pay some debt, fulfil some contract, release some person or property. Demands are either express or implied. Sometimes an express demand is required before action can be taken, in other cases the law requires no more than the demand implied by bringing an action. Whether an express demand is required

before a plaintiff can commence action to enforce fulfilment of a contract depends upon the express or implied stipulations of the parties to the contract. When no date is given in a contract for its fulfilment, whether in the case of a promissory note, or in the contracting of a debt, the payment of the obligation is due on the present day, or immediately on demand. It is requisite, in some cases arising *ex delicto*, that is, in some criminal cases, to make a demand for the restoration of the right before the commencement of an action, or, for instance, when the wife or other member of the plaintiff's household has been enticed away, in order to constitute the party a wilful wrongdoer, a demand for restoration must be made. When property lawfully obtained possession of is unlawfully detained, or converted, a demand for the delivery of its possession to the owner is requisite before an action can be laid. When an order to pay, or to do something has been made a rule of court, a demand for the payment of the money, or performance of the thing must be made before an attachment will be made for contempt. In like manner, before action can be taken for breach of promise of marriage, a demand for marriage must be made by the plaintiff, unless the defendant has married another person, or has refused to marry at any time. See **CONTRACT**; **RECOGNIZANCES**; **RELEASE**.

Demand and Supply, in political economy, the desire for services or utilities on the one hand, and the production or offer of them on the other, which tend to complete an act of exchange. Demand is commonly said to be relative to supply, but in reality it is reciprocal to it. Certain political economists qualify the term demand by the word effectual, but it is scarcely necessary to make such a limitation. A mere desire for objects has no commercial significance, but that desire simply which contemplates a mutual benefit. Thus the wish of a beggar to possess a diamond cannot affect the price of the article, as he can offer no desirable object in return. The intensity of demand, and the consequent effect upon values, will be proportionate to the necessity which exists for satisfying the demand. Different rules, therefore, will apply to the increase of price consequent upon increased demand and reduced supply in articles of voluntary use, and to the same rise in price when affecting articles of necessary use. The demand for the latter class of utilities is constant, and a deficiency in supply cannot be met by abstinence, except to a scarcely appreciable degree, whereas any considerable deficiency in the supply of articles of voluntary use is to some extent met by economy. Prices will, therefore, increase in different ratios according to the degree in which the commodities demanded are necessary or convenient. Thus the price of grain may rise, in the case of a bad harvest, from 50 to 100 per cent; cotton or wool, in similar circumstances, would certainly fluctuate, but not to anything like the same extent; wine would vary in price least of all; the deficiency in the last two commodities being artificially restored by the decrease of demand consequent on economy and abstinence. See **POLITICAL ECONOMY**.

Demar'atus, Spartan king. He succeeded his presumed father, Ariston, about 510 B.C.; but lost the throne, partly in consequence of a quarrel with his colleague, Cleomenes, and partly

DEMARICATION — DEMBINSKI

on account of doubts which had been cast upon his real parentage. He retired into private life; but having afterward become a magistrate, was sitting in that capacity at the Gymnopædian games when Leotyichides, who had supplanted him as king, sent tauntingly to ask him how he felt in a secondary place after having occupied the first. The boldness of his reply forced him to take flight, and he passed over into Asia, where he was well received by Darius. He afterward accompanied Xerxes on his expedition against Greece, and is said to have given counsel which, if listened to, would probably have made the issue of it very different from what it eventually proved.

Demarcation, Line of, the boundary established 4 May 1493 by Pope Alexander VI., who assigned to Spain all the lands she had discovered or might discover west of a line running from the North pole to the South, distant 100 leagues west of "any of the" Azores and Cape Verde Islands (provided such lands had not been in the actual possession of any other Christian king or prince up to the preceding Christmas), and to Portugal, on the same conditions, all the territory she had discovered or might discover east of the said line. The governments of the peninsula held that the Pope had sole and absolute authority to dispose of all countries inhabited by heathen peoples; moreover the papal bull *inter cetera* of 4 May 1493, under penalty of excommunication, forbade all persons without special permit to go "for the purpose of trade or any other reason" to the islands and mainlands thus granted exclusively to Spain and Portugal. After this territorial concession had been made, Portugal's possessions in the eastern hemisphere were called the East Indies, and those of Spain in the western hemisphere were called the West Indies. An extension of the papal gift of the Indies was made in the bull dated 25 Sept. 1493. A dispute arising in regard to the position of the line of demarcation, the two countries concerned sent commissioners to the Spanish city of Tordesillas, and on 7 June 1494 the commissioners agreed that the line should pass, north and south, 370 leagues west of the Cape Verde Islands. On the strength of this agreement, Portugal claimed and secured the eastern part of South America (see BRAZIL). After the Victoria returned to Seville (1522) from her voyage to the Moluccas, and so round the world, the Portuguese accused their rivals of having broken the treaty of Tordesillas. The Spaniards in reply said that the Spice Islands (Moluccas) were not within the limits of the Portuguese territory. To settle this important dispute, a congress was convened at Badajos in 1524. Commissioners of both countries were in attendance—Fernando Columbus, Sebastian Cabot, and others. The two main points to be decided were: (1) whether the line of demarcation should be drawn at the stated distance west of the western or eastern limit of the Cape Verde Islands; and (2) where it would pass on the opposite side of the earth. This Badajos junta failed to come to an agreement "owing to the Portuguese experts, who could not overcome this dilemma: If the line was pushed more to the west, Portugal would gain a greater part of Brazil; but she might lose all rights over the Moluccas, as the line, of course, had to be carried to the other hemisphere as well." The treaty of Vitoria, signed

19 Feb. 1524, provided that, inasmuch as some doubt existed between the sovereigns of Castile and the king of Portugal as to the possession and ownership of the Moluccas, there should be appointed by each one of the parties to the treaty "three astrologers and three pilots, and sailors, for the determination of the demarcation." A treaty negotiated at Saragossa and signed by representatives of the Spanish and Portuguese monarchs 22 April 1529 fixed the line of demarcation 297½ leagues east of the Moluccas, Spain selling for a stated sum whatever rights she had formerly claimed to possess in the Spice Islands, and agreeing for the future practically not to colonize, and expressly not to "trade there in any manner whatsoever." It did not seem necessary at that time to raise the question as to the location of the line in the New World, though it is plain that if the circle thus "determined from pole to pole" in the east had been logically completed, Portugal would have been excluded from the South American continent. The bearing of this matter upon Spanish rights in the Philippines is of special interest. The Molucca Islands, the Philippines, and, indeed, the western half of Australia lay within the Portuguese assignment, as a matter of fact. Therefore the principal Spanish settlements and explorations in the Far East appear to have been made in contravention of Portugal's treaty rights.

Consult: Blair and Robertson, 'The Philippine Islands,' Vol. I.; Harris, 'The Diplomatic History of America'; Dawson, 'The Line of Demarcation of Pope Alexander, etc. . . . with an inquiry concerning the Metrology of Ancient and Medieval Times,' in Proceedings of Royal Society of Canada, 1899.

MARRION WILCOX.

Demavend, *dēm-a-vēnd'*, a volcanic mountain, now extinct, of Persia, and the highest peak of the Elbruz chain, 45 miles south of the Caspian Sea, and about 40 miles northeast of Teheran. Its height, according to the most reliable measurement, is 18,464 feet. At a distance the mountain has the form of a smooth cone, and appears to slope evenly from top to bottom at an angle of 45°. The cone terminates in a crater of 85 yards in diameter, and nearly surrounded by jagged rocks, composed partly of basalt and partly of limestone and sulphur. This sulphur is an article of commerce. The basin within is almost entirely filled with snow. Around the base are many hot springs. William T. Thompson was the first European to ascend Demavend (1837).

Dembea, *dēm'bē-a* or *dēm-bē'a*, or **Tzana**, a lake of Abyssinia, in the western part of the country. It is about 50 miles long and 6,000 feet above the level of the sea. It contains many islands, one of which is a place of confinement for state prisoners. The Bahr-el-Azrek, the Abyssinian Nile, flows through it.

Dembinski, *dēm-lēn'skē*, **Henryk**, Polish general: b. Strzalkow, near Cracow, 3 May 1791; d. Paris 13 June 1864. In the year 1825 he became a member of the Polish diet, where he cast in his lot with the opposition party. On the outbreak of the revolution in that country (1830), he was made brigadier-general, and in the following year was nominated governor of Warsaw and commander-in-chief of the Polish army. On the fall of Warsaw in September

into the hands of the Russians, Dembinski made his escape. The Hungarian revolution of 1849 once more offered him a field for his activity, and he was appointed by Kossuth commander of the insurgent troops. He had the misfortune to lose the battle of Kopolna, and resigned his command, but consented to act under Görgei. After the capitulation signed by the latter at Villagos, and the resignation of Kossuth, Dembinski fled to Turkey.

Deme, *dēm*, a subdivision of ancient Attica and of modern Greece. The *dēmoi* were townships or hundreds, subdivisions of the *phulai*, and were equivalent to the Dorian *komai*, Latin *pagi*. The word really meant a country district, or a common name for divisions of the country, and in the time of Herodotus they were 100 in number in Attica (10 in each *phulē*), afterward 170; their origin was commonly referred to Theseus. The word *dēmos* early came to be applied to the commons, and survives significantly in our democracy and demagogue.

Dementia, a mental condition in which there is a breaking down or weakness of what originally was a competent mind. Dementia is usually a secondary condition, although primary and secondary forms are distinguished by alienists. Primary or acute dementia usually follows some violent physical or mental shock, which may paralyze the brain functions for a time or for life. Secondary dementias are those that follow other forms of the insanities, or are the result of senile changes. Acute primary dementia occurring in young adults is now spoken of as dementia *præcox*. The most characteristic symptoms are a somewhat vacant and expressionless face; confused memories, or loss of memory; excitement, which may alternate with periods of stupor; diminished sensibility to pain; loss of desire to eat, or else gluttony; incoherent thinking; stumbling, or muttering speech, or speechlessness; lowered reflexes, etc. Some patients may recover partially, but the usual history is that they remain permanently demented and pass into secondary demented states. Chronic dementias, it has been said, usually follow attacks of mental disease, which, as Maudsley says, "instead of passing away in their due season and leaving a clear mind, lapse by quick or slow steps of degeneration into terminal dementia. Comparative peace remains then, but it is the peace of a desert." Alcoholism, epilepsy, apoplexy, and nutritional changes all bring about chronic dementia. See **INSANITY**.

Demerara, *dēm-ê-râ'ra*, The District of, one of the three parts into which British Guiana is divided. In the uplands coffee is produced, and in the lowlands sugarcane and rice; these being the principal articles of exportation. The capital of this district and of the colony as well is Georgetown, which sometimes is also called Demerara.

Demerara River, British Guiana, rises in the unexplored mountains of the interior, flows northward, and empties into the Atlantic at Georgetown. It is navigable for small vessels to a point about 150 miles above its mouth. The estuary of the Demerara forms a moderately good harbor. See **GEORGETOWN**.

Demesne, *dē-mēn'*, or **Domain** (in French *domaine*), in its popular sense, denotes, under a feudal aristocracy, the lord's domain, his

manor place, with the lands thereto belonging. In England the *demesne* of the crown denotes either the share reserved to the crown in the distribution of landed property at the time of the Conquest, or such as came to it afterward, by forfeitures or other means. They are at present contracted within a very narrow compass, having been almost entirely granted to private subjects. The rents and profits of the *demesne* lands of the British crown are no longer kept separate, but are incorporated with the ordinary revenue. See **CIVIL LIST**.

The alienation of the domains in France, rendered necessary to reward powerful supporters, was the main cause of the fall of the Carolingian dynasty. The succession of the Capets was likewise due to their great possessions, which rendered them the most powerful nobles in France. The policy of this house, particularly of Louis XI. of the Valois branch, in despoiling the great nobles, made them at length absolute masters of the kingdom, although at first their authority, beyond their own domains, was very feeble. The despotic power of the French monarchy reached its climax under Louis XIV., the most powerful of the Bourbon branch of the family. The nobility had now lost nearly all its feudal privileges, and could easily be rewarded by places at court, appointments in the public services, and pensions out of the national revenue. Napoleon, who endeavored as much as possible to revive the traditions and institutions of the monarchy, had also a *domaine extraordinaire* (law of 30 Jan. 1810), which consisted of his acquisitions by conquests, and were kept entirely at his disposal; these supplied the means of donations to his generals, etc. The *domaine extraordinaire* was likewise retained by the Bourbons (law of 22 May 1816). The administration of these donations was conducted with great wisdom; and Napoleon, as Las Casas relates, dwelt with pleasure on this branch of his government.

Demeter, *dē-mē'tēr*, one of the twelve principal Grecian deities, the great mother-goddess, the nourishing and fertilizing principle of nature. She was the daughter of Cronos and Rhea, and mother of Persephone (often called Cora, the Maiden, the Proserpine of Roman mythology), and according to Hesiod, of Dionysus (Bacchus). By later writers Demeter is represented as being the wife of Dionysus. The main feature in the mythus of Demeter, and that which forms the fundamental idea of her worship, is the loss and recovery of her daughter, Persephone. Zeus, without the knowledge of Demeter, had promised Persephone to Pluto, who carried her off as the earth opened in a field where Zeus had caused some flowers to grow to tempt the unsuspecting maid. Her mother, who heard the echo of her cries, but did not see who had carried her away, sought for her in vain over the earth, till Helios told her that Pluto had carried her off with the connivance of Zeus. Demeter vowed never to return to Olympus until her daughter accompanied her. Zeus sent first Iris, and then all the gods, to implore her to return, but without success; at last, fearing lest the race of mortals should perish, she having afflicted the earth with sterility, he despatched Hermes to Erebus to bring back Persephone. Pluto consented to her return, but gave her a pomegranate, and she

DEMETER — DEMI-MONDE

having eaten of the fruit of Erebus, was compelled thenceforth to spend a part of every year in the infernal regions. Hermes conducted her to her mother at Eleusis, and Zeus sent Rhea to urge Demeter to revisit Olympus, and tell her that he had consented that Persephone should remain two thirds of the year with her mother, the remaining third (the winter season) being passed with Pluto. Demeter now consented to return and to restore fertility to the earth; but before departing from Eleusis, which she had made her abode, she taught Triptolemus how her worship was to be conducted, and initiated him into the mysteries of the Eleusinia. In ancient monuments Demeter is represented as a beautiful matronly woman, with a mild and benevolent expression of face; she is always enveloped with ample drapery, which is usually close up to the neck; sometimes, however, one of her breasts is left exposed. Prof. Max-Müller identifies her with the Sanskrit *Dyâvâ Mâtar* (the Dawn). By the Romans she was identified and worshipped with Ceres (q.v.).

Demeter, Dimitrija, dē-mē-trē'zhā dē-mē'tēr, Croatian dramatist and poet: b. Agram 21 July 1811; d. there 24 June 1872. His principal dramas are: 'Love and Duty'; 'Blood-Revenge'; and the tragedy 'Teuta.' He wrote a lyro-epic poem, 'The Battlefield of Grobnik,' and several stories. He translated several foreign dramatic works into Croatian.

Deme'trius I., surnamed **Poliorcetes**, king of Macedonia: d. Pella, Syria, 284 B.C. He appeared before Athens with a fleet, and restored to the people their ancient form of government (307 B.C.). Having lost the battle of Ipsus against Seleucus, Cassander, and Lysimachus (301 B.C.), he fled to Ephesus, and passing over to Corinth, embarked on an expedition against the Thracian dominions of Lysimachus. He then went to Asia, to bestow his daughter Stratonice in marriage on Seleucus, and on his way took possession of Cilicia, by which his friendship with Seleucus was broken off. He conquered Macedonia (294 B.C.), and reigned seven years, but lost this country by his arbitrary conduct.

Demetrius II. (called "Nicator"), king of Syria: d. 126 B.C. Ptolemy Philometer, king of Egypt, placed him on the throne of his father, after expelling the usurper, Alexander Balas, 146 B.C. He married Cleopatra, the wife of the same Alexander, and daughter of Ptolemy.

Demetrius, or **Dmitri**, a series of impostors who usurped supreme authority in Russia, and led to some of its remarkable revolutions. Ivan Wasiliewitch, who had put his eldest son to death, left the throne in 1584 to another son, Fedor, whom Boris Godunow entirely supplanted in his authority. Ivan had left another son, Dmitri, by a second marriage; and Boris, fearing that he might one day prove a formidable obstacle to his ambitious projects, made away with him, but no one exactly knew how. Shortly after, in 1598, Fedor died, and Boris took possession of the throne. Mystery still hung over the fate of Dmitri, and Grishka, or Gregory Otrepieff, determined to turn it to account. Several persons had been struck with his resemblance to Dmitri, and he at once explained the fact by declaring that he was Dmitri indeed, and that the design of Boris to murder him had been frustrated. The report quickly spread, and

Otrepieff fled into Poland, where Sigismund III., king of Poland, who saw in him a useful instrument for introducing Polish influence into Russia, aided him to enter that kingdom at the head of a body of troops. Boris was deserted by his soldiers, and ended his life by poison. Otrepieff in 1605 entered Moscow in triumph, and, as the genuine son of Ivan, was proclaimed grand duke of Russia. He was now firmly seated on the throne, and might have transmitted it to his descendants had he governed with prudence. Conspirators, after exciting a tumult, forced their way into the palace and put the false Dmitri to death. His body was exposed to public view, but in such a state that its features could not be recognized; and a rumor of his being still alive having spread, another impostor quickly appeared to personify him. The Poles espoused the cause of the second false Dmitri, and had made it triumphant, when he was assassinated in 1610 by the Tartars whom he had selected as his body guards. A state of anarchy ensued, and continued for nearly half a century, during which a number of other false Dmitri appeared in different quarters.

Demetrius Phalereus, *fa-lē'rē-ūs*, Greek orator. He was made Macedonian governor of Athens, and archon (309 B.C.), and embellished the city by magnificent edifices. The gratitude of the Athenians, over whom he ruled, erected him as many statues as there are days in the year, but these were afterward scornfully broken, and he himself condemned to death by that fickle people. He fled to Egypt, where he is said to have promoted the establishment of the Alexandrian Library, and of the museum, the superintendence of which Ptolemy Lagus entrusted to him. Under Ptolemy Philadelphus, he fell into disgrace, and was banished to a remote fortress, where he died from the bite of an asp. Demetrius was among the most learned of the Peripatetics, and wrote on several subjects of philosophical and political science. But the work on rhetoric, under his name, belongs to a later age.

Demetz, dē-mās, Frédéric Auguste, French philanthropist and prison reformer: b. Paris 12 May 1796; d. there 22 Nov. 1872. He was judge, vice-president of the chamber of correctional police, and court counselor. He founded in 1840, the penitential and agricultural colony of Mettray for juvenile delinquents, devoting himself wholly to this establishment, which has served as a model in France and elsewhere. He was elected corresponding member of the Academy of Moral and Political Sciences, Paris, in 1864. He wrote many essays and reports upon penitentiary methods and reforms.

Demi Lune (same as ravelin), in fortification, is a work constructed to cover or protect the curtain or wall of a place, and the shoulders of the neighboring bastions. It is composed of two faces forming a salient angle toward the open country outside the place. It has two demi-gorges formed near the counterscarp, and is surrounded by a ditch.

Demi-monde, *dēm'ī-mônd*, an expression first used by the younger Dumas in a drama of the same name (first performed in 1855), to denote that class of gay female adventurers who differ from honest women in being the objects of public scandal, and from courtesans by their non-venality. When the word is used elsewhere

than in France the last-mentioned difference is seldom kept in mind.

Demi-relief, or **demi-rilievo**, *rĕ-lĕ'vō*, a term applied to sculpture projecting moderately from the face of a wall; half raised, as if cut in two, and half only fixed to the plane. *Mezzorilievo*, which is the more correct term used to designate this style of sculpture, is lower than alto-rilievo and higher than basso-rilievo.

Demidoff, *dĕm'ĕ-dōf*, or **Demidov**, a noble Russian family, whose head, Nilka Demidoff, was an armory-founder at Toula. This Demidoff was intrusted by Peter the Great with the business of casting the cannon for that prince's numerous warlike expeditions. He actively seconded all the exertions of the czar, and in 1725 discovered the mines of Kolyvan, the working of which speedily enriched him. He left a son, Nitika, and several grandsons, who distinguished themselves in the same career as their progenitor, and amassed colossal fortunes. The best known of these are Prokop Demidoff, who worked with great profit the iron, copper, and gold mines of the Ural Mountains; Nikolai Nikitich (about 1773-1828), a zealous philanthropist, who introduced into his country several branches of industry, founded establishments of public utility, and carried to a great state of perfection the working of mines. He had an annual income of more than \$1,000,000. His last years he passed in France and Italy, enjoying the society of learned men, and heaping benefits on all around him. He left two sons, Paul and Anatole (1812-70), who, as well as inheriting his fortune, had also the same high taste and benevolence.

Demijohn, a jug in a wickerwork casing or box. The name naturally suggests "half-John," or somebody or something directly or indirectly connected with some "John" and liquor. But demijohns are used for holding all sorts of liquors—not necessarily intoxicants.

The origin of the word is uncertain. We get it from the French "*damejeanne*," which signifies a "demijohn," just as in our language. And that word appears to have been originally a corruption of "*Dame Jeanne*," or Lady Jane—or else to have gone into the French tongue directly from the Arabic "*damagan*" (a demijohn), said to be so called from Damagan, a town in Khorasan, a northern province in Persia, once famous for its glass-works, and to have been the spot where glass jugs enclosed in wickerwork were originally made.

The demijohns themselves are a most important article in the liquor, oil, drug and paint trades, not to mention other branches generally not so well known. The largest demijohn regularly made for the trade has a capacity of five gallons. The smallest holds $1\frac{1}{2}$ ounces, or less than a gill. This size is used chiefly for perfumery and cordials. Between the five-gallon and the gill size demijohns are made in many sizes, including quarts, pints and half-pints. Demijohns are not very costly, but the very smallest are the most expensive proportionately. A gill demijohn sells for more than one that will hold half a gallon, the reason being that the little ones must be covered and finished with great care, while in the larger sizes the chief thing required is serviceability. For the basket work on the smaller demijohns takes more time and costs more for labor than a demijohn some

sizes larger. Demijohns are used for many purposes. They are filled with vinegar, molasses, perfumery, bay rum, cordials, extracts, essences and for various waters. Almost all the demijohns used in America are made here, though some are imported from Germany and France. Before sending them to this country they pack their big demijohns in cork scraps, or shredded sponges for their protection and transportation. Our big five-gallon demijohns are made in the form of box-demijohns, the bottle being incased not in wickerwork, but in a box, or a wooden crate. Sometimes smaller ones are made in this way. The big demijohns are known as carboys and are regularly employed to transport chemicals.

De Mille, Henry Churchill, American playwright: b. North Carolina about 1853; d. Pompton, N. J., 10 Feb. 1893. He was graduated at Columbia College, and was by turns preacher and teacher till 1882, when he became examiner of plays at the Madison Square Theatre, and later for a short time an actor. His first successful play was the "*Main Line*," in which he collaborated with Charles Barnard. In 1887, having become associated with David Belasco, he wrote the well-known society dramas: "*The Wife*" (1887); "*Lord Chumley*" (1888); "*The Charity Ball*" (1889); "*Men and Women*" (1890). His last work was a melodrama adapted from the German, entitled "*Lost Paradise*," which was successfully produced in 1892.

De Mille, James, Canadian novelist: b. St. John, N. B., Aug. 1837; d. Halifax, N. S., 28 Jan. 1880. Graduated at Brown College in 1854. He was professor of classics in Acadia College (1860-5), and of history and rhetoric in Dalhousie College, Halifax, from 1865 until his death. Among his publications are: "*The Dodge Club*" (1866); "*Cord and Creese*" (1867); "*A Comedy of Terrors*" (1872); "*The Living Link*" (1874); and many books for boys, including "*Treasures of the Sea*." A posthumous work, "*A Strange Manuscript Found in a Copper Cylinder*," appeared in 1888. A treatise of his on rhetoric was published in 1878.

Deming, Clarence, American journalist: b. Litchfield, Conn., 1 Oct. 1848. He was graduated at Yale College 1872; was assistant editor of the *Troy Whig*, 1872-3, and served as night editor of the *New Haven Palladium* 1874-5. He was on the staff of the *New York Evening Post* 1874-84, and was afterward for several years editor of the *New Haven News*. He is the author of "*By Ways of Nature and Life*."

Deming, Philander, American lawyer and author: b. Carlisle, N. Y., 6 Feb. 1839. He was graduated at the University of Vermont 1861, and at the Albany Law School. From 1878-9 he was president of the New York State Law Stenographers' Association. He began to write stories for the magazines in 1873, and his published books include "*Adirondack Stories*"; "*Tompkins and Other Folks*."

Demise, *de-mīz'* (literally, a "laying down"), a grant by lease; it is applied to an estate either in fee-simple, or for a term of life or years. The word demise in a lease implies an absolute covenant on the part of the lessor for the lessee's peaceable enjoyment during the term. As applied to the crown of England, demise signifies its transmission to the next heir on being laid down by the sovereign. "So tender

DEMISEMIQUAVER — DEMOCRACY

is the law of supposing even a possibility of the sovereign's death, that his natural dissolution is called his demise, an expression which merely signifies a transfer of property" (Blackstone).

Demiseมิချာဝါး, in musical notation it is half a semiquaver (sixteenth note), or the thirty-second part of a semibreve (whole note). When written as a note or rest it has three little crooks or bars appended to the stem.

Demiurge, *dēm'i-ěrj* (Greek, *demiourgos*, "a handicraftsman"), designation applied by Plato and other philosophers to the Divine Being, considered as the Architect or Creator of the universe. The Gnostics made a distinction between the Demiurge and the Supreme Being; with them the first is the Jehovah of the Jews, who, though deserving to be honored as the Creator, was only the instrument of the Most High. He was also called Archon and Son of Chaos, chief of the lowest order of spirits or sons of the Pleroma. He corresponds to the Logos or Word of St. John.

In some of the Peloponnesian states of ancient Greece the name Demiurge seems to have been given to a chief magistrate, probably corresponding to the Roman tribune. The origin of evil was sometimes attributed to the Demiurge.

Democe'des, Greek physician: b. Crotona about 550 B.C.; d. 504 B.C. He was for a time physician to Polycrates, tyrant of Samos; was taken prisoner by the Persians and rose to a position of considerable influence at the court of Darius I. through his medical skill. He persuaded the king to send him with others on a secret mission to Greece, but escaped from his companions and fled to Crotona.

Democracy (Gr. *δημοκρατία* = *dēmos*, the people, and *κράτος*, power), a form of government in which the people, either directly or through their representatives, are supreme; according to Lincoln's definition, a government of the people, by the people, for the people. A pure democracy was for many centuries the dream of political idealists, because it meant liberty with the full power of self-development to the individual. The Greeks were the first people who tried to realize the democratic ideal. Aristotle enumerates among the three possible forms of government the monarchy, the oligarchy, and the democracy. The monarchy however may be a despotism, like that of Russia; a monarchy, like that of Germany overruling by the power of the army the will of chancellor or prime minister and parliament, and claiming the divine right of kings; or a limited monarchy, like that of England, in the history of which the parliament has more than once proved itself paramount. The oligarchy, the supremacy of a small class, may be based on hereditary rank, or property qualifications. The democracy may be mixed and partial, as when it tolerates the existence of slaves in its territory, as Athens did; or it may degenerate into ochlocracy, mob government, as in the early days of the French republic, whose counsels were swayed alternately by the power of a sort of oligarchical minority, and the stormy and fluctuating passions of the mob. More important is the distinction in a democracy between direct and indirect representation. The Athenian democracy professed to establish direct representation of the demos. In the agora or place of legislative assembly everyone but slaves might

speak and vote. Such was the theory, but as a matter of fact only 1 in 40 was qualified to vote out of a population of more than half a million. Nor can it be forgotten that direct representation in the agora, or parliament of Athens, was practically limited to the city of Athens; not even the whole territory of Attica was represented there, much less the Athenian islands and dependencies. Even at Athens, the importance of the masses was never recognized. The main power was aristocratic, and the conflicts of the agora exhibited the people swayed hither and thither by speeches of men like Pericles and Alcibiades, or lashed into fury by plebeian Cleon in his vain attempt to break through the phalanx of aristocratic exclusiveness. The Roman republic was not a democracy in the sense of giving full voice to the will of the people; its republicanism consisted in a hatred for the name of king. The essence of a democracy lies in the abolition of institutions which shall give constitutional permanence to class distinctions. In the light of this principle it will plainly be seen that the mediæval communes or republics of Italy fell very far short of being democratic in their character. Here we may point out how much confusion there exists in men's minds in distinguishing between political and social democracy, between the democracy of laws and the democracy of sentiment and manners. The principle of the legal and political equality of men is not inconsistent with the utmost variety of natural and social distinctions. It only forbids the creation by law of artificial distinctions. The example of the American people shows that democratic political institutions are compatible with very great inequalities in cultivation, manners, style of living, social consideration and the distribution of property.

Modern democracy, as we now see it, is the result of a gradual process of development continued through centuries amidst the severest struggles. Such struggle will appear to be inevitable, when we consider that democracies have grown up in large states in which absolutism formerly prevailed, and in which the military system prevails even yet. Among the decisive steps in the modern struggle of the people against the old classes and systems should be noted the long contest of the Dutch against Spain, the great English revolutions of 1642 and 1688, the war of American Independence in 1776, the great French Revolution of 1789, and the revolutionary periods of 1830 and 1848. The English revolutions of 1642 and 1688 established parliamentary rule in England, though on a narrow basis. Yet they had the important result of proving the fitness of a new type of government, which further became a model for similar institutions in other countries. The greatest event in the evolution of democracy, however, was the French Revolution of 1789; though it failed for the time, it shook the old system to its foundations; it everywhere spread new ideas, and raised questions that could not again be set aside. The revolution of 1830 showed that the reactionary conditions prevalent after Waterloo had no claim to permanency. The revolutionary movements of 1848, which affected France, Italy, Austria and Germany, were apparently a failure, yet they overthrew what remained of the feudal system in western and central Europe. But the most significant thing connected with that period is the fact that

DEMOCRATIC PARTY

only a few years afterward universal suffrage was introduced in all the countries where its influence had been felt. Governments which had been most active in suppressing the revolution found it expedient to adopt its cardinal principles. The fundamental basis of democracy is the recognition of the rights of man as man. Its central principle is the equality of all men before the law, without regard to birth, property, or social rank; from which principle is deduced the right of all men to an equal voice or vote in deciding upon public affairs, or in selecting agents and representatives to perform the functions of legislation and to execute the laws. The principles of democracy are forcibly and clearly stated in the American Declaration of Independence, in the words of Thomas Jefferson, who has been called "the apostle of democracy": "We hold these truths to be self-evident; that all men are created equal; that they are endowed by their Creator with certain inalienable rights; that among these are life, liberty, and the pursuit of happiness. That, to secure these rights, governments are instituted among men, deriving their just powers from the consent of the governed." These principles are still more fully developed in the constitutions of the States of the Union. The constitution of New Hampshire (1792) says: "All men are born equally free and independent; therefore all government of right originates from the people. All power residing originally in and being derived from the people, all the magistrates and officers of the government are their substitutes and agents, and at all times accountable to them." These principles are enunciated with equal clearness in the Constitutions of other States of the Union. It is as representing these principles that the government of the United States, as also of the several States that constitute the Union, is democratic in fullest sense of the term.

As we have seen, the distinctive features of the modern democracy are the widest personal freedom, by which each man has the liberty and responsibility of shaping his own career; equality before the law; and political power in the form of universal suffrage, exercised through the representative system. With these are associated universal education, and on the continent of Europe universal liability to military service. In Great Britain and the United States universal liability to military service exists also in theory as regards the militia. On the European continent it is a momentous fact imposed upon its peoples by the necessities of the struggle for existence, which the moral development of mankind has not yet been able so to regulate as to put an end to war. Anglo-Saxon countries are happily freer from such necessities. It is an interesting fact, however, that Prussia, which was the first great nation to adopt universal education, was also the first to introduce universal military service.

It is important to remember that the growth of the modern democracy has gone hand in hand with the general development of the most advanced nations of the world. The consolidation of the political power of the people is the result of far-reaching causes operating on a great scale throughout the history of modern nations. The growth of the democracy is intimately connected with the growth of every other factor in the social life. For example, the different stages in the rise of the democracy could be paralleled by the improvements in the art of printing. The

development of the democracy has on the one hand created the demand for cheap literature and cheap newspapers, but it has also on the other hand depended on the supply of them. Further, the growth of the cheap newspaper and of cheap literature depends on the industrial development, on the improvement of our technical capacities and resources, on man's growing mastery over nature. To the production of the daily newspaper a thousand technical appliances are subsidiary. Steam and electricity are the great forces that move the vast mechanism on which society is now based. In fact the growth of the democracy is intimately connected with an industrial and technical development which has culminated in the railway, the penny post, the electric telegraph, and the steam printing-press. The peculiar influence of the human voice has not been superseded, yet it is chiefly through the telegraph and the printing-press that the modern democracy obtains the education which the ancient democracy received in their popular assemblies and in the daily intercourse of the market-place.

Democratic Party, The, one of the chief political organizations in the United States. To Thomas Jefferson belongs the honor of being the founder, and for a third of a century the undisputed leader, of the Democratic party. Scarcely had the present Constitution been adopted before there appeared a line more or less distinct dividing those who, like Jefferson (q.v.), believed the people fully capable of self-government and trusted them, and those who, like Hamilton (q.v.), thought that the masses needed to be under the control of a strong and centralized government. This fundamental difference of opinion manifested itself in the treatment of every important question, and party organizations were soon perfected.

As Jefferson himself has described the birth of parties in the United States, his opinion can be accepted as authoritative. In a letter written in June 1823, near the close of his life, to William Johnson, he said:

At the formation of our government, many had formed their political opinions on European writings and practices, believing the experience of old countries, and especially of England abusive as it was, to be a safer guide than mere theory. The doctrines of Europe were that men in numerous associations cannot be restrained within the limits of order and justice, but by forces physical and moral, wielded over them by authorities independent of their will. Hence their organization of kings, hereditary nobles, and priests. Still further to constrain the brute force of the people, they deem it necessary to keep them down by hard labor, poverty and ignorance, and to take from them as from bees, so much of their earnings, as that unremitting labor shall be necessary to obtain a sufficient surplus barely to sustain a scanty and miserable life. And these earnings they apply to maintain their privileged orders in splendor and idleness, to fascinate the eyes of the people, and excite in them an humble adoration and submission, as to an order of superior beings. Although few among us had gone all these lengths of opinion, yet many had advanced, some more, some less, on the way. And in the convention which formed our government, they endeavored to draw the cords of power as tight as they could obtain them, to lessen the dependence of the general functionaries on their constituents, to subject to them those of the States, and to weaken their means of maintaining the steady equilibrium which the majority of the convention had deemed salutary for both branches, general and local. To recover, therefore, in practice the powers which the nation had refused and to warp to their own wishes those actually given, was the steady object of the Federal party.

DEMOCRATIC PARTY

Ours, on the contrary, was to maintain the will of the majority of the convention and of the people themselves. We believed, with them, that man was a rational animal endowed by nature with rights and with an innate sense of justice; and that he could be restrained from wrong and protected in right, by moderate powers confided to persons of his own choice, and held to their duties by dependence on his own will. We believe that the complicated organization of kings, nobles, and priests, was not the wisest nor best to effect the happiness of associated man; that wisdom and virtue were not hereditary; that the trappings of such a machinery, consumed by their expense, those earnings of industry they were meant to protect, and, by the inequalities they produced, exposed liberty to suzerainty. We believe that men, enjoying in ease and security the full fruits of their own industry, enlisted by all their interests on the side of law and order habituated to think of themselves and to follow their reason as their guide, would be more easily and safely governed, than with minds nourished in error and vitiated and debased, as in Europe, by ignorance indigence, and oppression. The cherishment of the people then was our principle, the fear and distrust of them that of the other party. Composed, as we were, of the landed and laboring interests of the country, we could not be less anxious for a government of law and order than were the inhabitants of the cities, the strongholds of federalism. And whether our efforts to save the principles and form of our Constitution have not been salutary, let the present republican freedom, order, and prosperity of our country determine.

Jefferson not only gave a history of the formation of parties, but fortunately for later generations, he enumerated the elements which each party contained. In a letter to C. E. Ebeling in 1795 he said:

Two parties exist within the United States. They embrace respectively the following descriptions of persons. The Anti-Republicans consist of: (1) The old refugees and Tories; (2) British merchants residing among us, and composing the main body of our merchants; (3) American merchants trading on British capital, another great portion; (4) speculators and holders in the banks and public funds; (5) officers of the Federal government with some exceptions; (6) office hunters willing to give up principles for places,—a numerous and noisy tribe; (7) nervous persons, whose languid fibres have more analogy with a passive than active state of things. The Republican party of our Union comprehends: (1) The entire body of landholders throughout the United States; (2) the body of laborers not being landholders whether in husbanding or the arts. The latter is to the aggregate of the former party probably as 500 to 1; but their wealth is not as disproportionate, though it is also greatly superior and is in truth the foundation of that of their antagonists. Trifling as are the numbers of the Anti-Republican party, there are circumstances which give them an appearance of strength and numbers. They all live in cities together, and can act in a body and readily at all times; they give chief employment to the newspapers, and, therefore, have most of them under their command. The agricultural interest is dispersed over a great extent of country, have little means of intercommunication with each other, and feeling their own strength and will, are conscious that a single exertion of these will at any time crush the machinations against their government.

Jefferson's philosophical mind sought not only the facts, but the reason for the facts, and in 1824, in a letter to H. Lee he thus classified men according to their party tendencies:

Men by their constitutions are naturally divided into two parties: (1) Those who fear and distrust the people and wish to draw all powers from them into the hands of the higher classes; (2) those who identify themselves with the people, have confidence in them, cherish and consider them as the most wise depository of the public interests. In every country these two parties exist, and in every one where they are free to think, speak, and write, they will declare themselves. Call them, therefore, liberals and serviles, Jacobins and ultras, Whigs and Tories, Republicans and

Federalists, aristocrats and Democrats, or by whatever name you please, they are the same parties still, and pursue the same object. The last appellation of aristocrats and Democrats is the true one expressing the essence of all.

Jefferson's purpose was to found a party that would be really democratic in personnel, in purpose and in method. The party, however, was at first called the Republican party, and afterward the Democratic-Republican party. It was not until in Jackson's time that it became universally known by its present name. As there were no national conventions and no national platforms in the early days of the Republic the position of the party on public questions must be gathered from the words and speeches of the leaders and from the votes of the members of the party in Congress. Jefferson's first inaugural address contained the essence of the party creed as generally accepted during the first quarter of the 19th century. In fact, it is still the creed of the party, and no group of men desiring to maintain an influence in the party can even now admit any essential departure from it. It will be found below:

About to enter, fellow-citizens, on the exercise of duties which comprehend everything dear and valuable to you, it is proper you should understand what I deem the essential principles of our government, and consequently those which ought to shape its administration. I will compress them within the narrowest compass they will bear, stating the general principle, but not all its limitations. Equal and exact justice to all men, of whatever State or persuasion, religious or political; peace, commerce, and honest friendship with all nations, entangling alliances with none; the support of the State governments in all their rights, as the most competent administrations for our domestic concerns and the surest bulwarks against Anti-Republican tendencies; the preservation of the general government in its whole constitutional vigor, as the sheet anchor of our peace at home and safety abroad; a jealous care of the right of election by the people—a mild and safe corrective of abuses which are lopped by the sword of revolution where peaceable remedies are unprovided; absolute acquiescence in the decisions of the majority and vital principle of republics, from which is no appeal but to force, the vital principle and immediate parent of despotism; a well-disciplined militia, our best reliance in peace and for the first moments of war, till regulars may relieve them; the supremacy of the civil over the military authority; economy in the public expense that labor may be lightly burdened; the honest payment of our debts and sacred preservation of the public faith; encouragement of agriculture, and of commerce as its handmaid; the diffusion of information and arraignment of all abuses at the bar of the public reason; freedom of religion, freedom of the press, and freedom of person under the protection of the *habeas corpus*, and trial by juries impartially selected. These principles form the bright constellation which has gone before us and guided our steps through an age of revolution and reformation. The wisdom of our sages and blood of our heroes have been devoted to their attainment. They should be the creed of our political faith, the text of civic instruction, the touchstone by which to try the services of those we trust; and should we wander from them in moments of error or of alarm, let us hasten to retrace our steps and to regain the road which alone leads to peace, liberty, and safety.

The first and most fundamental difference between the Democratic party (when it was known as the Republican party, afterward as the Democratic-Republican party, and to-day as the Democratic party) and the party which has opposed it (first known as the Federal party, then as the Whig party and more recently as the Republican party), was upon the construction of the Constitution. The former party has insisted upon a strict construction, while the latter

DEMOCRATIC PARTY

has leaned toward a liberal construction of the Federal constitution. This difference is a natural one for the Democratic party, believing in the right of the people to, and in the capacity of the people for, self-government, has insisted upon giving them as large a part as possible in the control of their own affairs.

It follows, therefore, that the Democratic party favors local self-government and opposes the centralization of power in remote centres. It believes that the nearer the people are to their government the more effective will be their control over it. The various parties that have opposed the Democratic party have given more or less emphasis to the Hamiltonian view and have increased the power of the representative at the expense of the constituents.

While this distinction has not at all times been clearly marked, and while these views have not been held by all the individual members, the general tendency has existed.

In the very beginning this tendency was illustrated in the Alien and Sedition laws, enacted by the Federalists and in the Kentucky and Virginia resolutions supported by the Democrats. (See ALIEN AND SEDITION ACTS, also Kentucky resolutions and Virginia resolutions.) Both parties in this instance went to the extreme, the Federalists attempting to confer dangerous power upon the Federal government, the Democrats asserting views which were afterward so misconstrued as to weaken the Federal Union. The preservation of the balance between the Federal government and the State governments has always been a delicate matter, and as the line cannot be drawn with mathematical accuracy there has always been room for dispute; the public sentiment having gone to the one side or the other as it was necessary to maintain the equilibrium. It is likely that this discussion will continue, but the efforts to carry the government to an extreme in either direction will be thwarted by the conservative middle class, which rallies to the support of the side that is attacked.

Beginning with Jefferson's administration in 1801, and continuing to the end of Monroe's administration in 1825, the Democratic party held undisputed sway in the nation. Jefferson, like Washington, refused to consider a third term, and his secretary of state, James Madison (q.v.), succeeded him. Madison, following the example set by his predecessor, retired at the end of his second term, and James Monroe (q.v.), who had been his secretary of state, succeeded him.

The War of 1812 was conducted by the Madison administration, and it was during this period that the Hartford resolutions were adopted by a convention of Federalists which met at Hartford, Conn., in December 1814. These resolutions went further in the direction of States rights than either the Kentucky resolutions or the Virginia resolutions. They began by recommending "to the legislatures of the several States represented in this convention, to adopt all such measures as may be necessary effectually to protect the citizens of said States from the operation and effects of all acts which have been or may be passed by the Congress of the United States, which shall contain provisions subjecting the militia or other citizens to forcible drafts, conscriptions, or impressments

not authorized by the Constitution of the United States."

While the Hartford resolutions announced a political policy, they had their origin in the commercial interests which were affected by the War of 1812, and by the embargo act (see EMBARGO) which was enacted as a war measure.

The Federal party which supported Clinton's candidacy in 1812 laid great stress upon the commercial interests. The platform adopted by the New York Federalists urged the election of Clinton as the surest method of guaranteeing the protection of those commercial interests which were flagging "under the weakness and imbecility of the administration." The Federalists attacked what they called the Virginia regency, and the Hartford resolutions recommended a constitutional amendment making the President ineligible for renomination, and another prohibiting the selection of two Presidents in succession from the same State.

It was during the administration of James Monroe that the doctrine, afterward known by his name, and followed ever since, was promulgated. The doctrine was set forth in a message sent to Congress by James Monroe on 2 Dec. 1823. (See MONROE DOCTRINE.) The following is the text covering this subject:

In the wars of European powers, in matters relating to themselves, we have never taken any part, nor does it comport with our policy so to do. It is only when our rights are invaded or seriously menaced that we resent injuries or make preparations for our defense. With the movements on this hemisphere we are, of necessity, more immediately connected, and by causes which must be obvious to all enlightened and impartial observers. The political system of the allied powers (the Holy Alliance) is essentially different in this respect from that of America. This difference proceeds from that which exists in their respective governments. And to the defense of our own, which has been achieved by the loss of so much blood and treasure, and matured by the wisdom of their most enlightened citizens and under which we have enjoyed unexampled felicity, this whole nation is devoted. We owe it, therefore, to candor and to the amicable relations existing between the United States and those powers to declare that we should consider any attempt on their part to extend their system to any portion of this hemisphere as dangerous to our peace and safety. With the existing colonies or dependencies of any European power we have not interfered, and shall not interfere. But with the governments who have declared their independence and maintained it we have on great consideration and on just principles, acknowledged we could not view any interposition for the purpose of oppressing them, or controlling in any other manner their destiny, by any European power, in any other light than as the manifestation of an unfriendly disposition toward the United States. Our policy in regard to Europe, which was adopted at an early stage of the wars which have so long agitated that quarter of the globe, nevertheless remains the same, which is not to interfere in the internal concerns of any of its powers; to consider the government *de facto* as the legitimate government for us; to cultivate friendly relations with it, and to preserve those relations by a frank, firm, and manly policy; meeting in all instances the just claims of every power, submitting to injuries from none. But in regard to these continents, circumstances are eminently and conspicuously different. It is impossible that the allied powers should extend their political system to any portion of either continent without endangering our peace and happiness; nor can any one believe that our southern brethren, if left to themselves, would adopt it of their own accord. It is equally impossible, therefore, that we should behold such interposition, in any form, with indifference.

This message was written after consultation with Jefferson, who was then living in retire-

DEMOCRATIC PARTY

ment at Monticello. The following extract from a letter written by Jefferson to Monroe in October 1823, not only shows Jefferson's part in the formulation of the doctrine, but also proves his foresight and his comprehension of American interests, and his devotion to the welfare of his country:

The question presented by the letters you have sent me, is the most momentous which has been offered to my contemplation since that of Independence. That made us a nation, this sets our compass and points the course which we are to steer through the ocean of time opening on us. And never could we embark on it under circumstances more auspicious. Our first and fundamental maxim should be, never to entangle ourselves in the broils of Europe. Our second, never to suffer Europe to intermeddle with cis-Atlantic affairs. America, North and South, has a set of interests distinct from those of Europe and peculiarly her own. She should, therefore, have a system of her own, separate and apart from that of Europe. While the last is laboring to become the domicile of despotism, our endeavor should surely be to make our hemisphere that of freedom. One nation most of all, could disturb us in this pursuit; she now offers to lead, aid, and accompany us in it. By acceding to her proposition, we detach her from the bands, bring her mighty weight into the scale of free government, and emancipate a continent at one stroke, which might otherwise linger long in doubt and difficulty. Great Britain is the nation which can do us the most harm of any one, or all on earth; and with her on our side we need not fear the whole world. With her, then, we should most sedulously cherish a cordial friendship; and nothing would tend more to knit our affections than to be fighting once more side by side in the same cause. Not that I would purchase even her amity at the price of taking part in her wars. But the war in which the present proposition might engage us, should that be its consequence, is not her war, but ours. Its object is to introduce and establish the American system, of keeping out of our land all foreign powers, of never permitting those of Europe to intermeddle with the affairs of our nations. It is to maintain our own principle, not to depart from it. And if to facilitate this, we can effect a division in the body of the European powers, and draw over to our side its most powerful member, surely we should do it. But I am clearly of Mr. Canning's opinion, that it will prevent instead of provoke war. With Great Britain withdrawn from their scale and shifted into that of our two continents, all Europe combined would not undertake such a war. For how would they propose to get at either enemy without superior fleets? Nor is the occasion to be slighted which this proposition offers, of declaring our protest against the atrocious violations of the rights of nations by the interference of any one in the internal affairs of another, so flagitiously begun by Bonaparte, and now continued by the equally lawless Alliance calling itself Holy. But we have first to ask ourselves a question. Do we wish to acquire to our own confederacy any one or more of the Spanish provinces? I candidly confess that I have ever looked on Cuba as the most interesting addition which could ever be made to our system of States. The control which, with Florida Point, this island would give us over the Gulf of Mexico, and the countries and isthmus bordering on it, as well as all those whose waters flow into it, would fill up the measure of our political well-being. Yet, as I am sensible that this can never be obtained, even with her own consent, but by war; and its independence, which is our second interest (and especially its independence of England), can be secured without it, I have no hesitation in abandoning my first wish to future chances and accepting its independence, with peace and the friendship of England, rather than its association, at the expense of war and her enmity. I could honestly, therefore, join in the declaration proposed, that we aim not at the acquisition of any of those possessions, that we will not stand in the way of any amicable arrangement between them and the mother country; but that we will oppose, with all our means, the forcible interposition of any other power, as auxiliary, stipendiary, or under any other form or pretext, and most especially, their transfer to any power by conquest, cession, or acquisition in any other way.

Jefferson died on 4 July 1824, just 50 years after the signing of the Declaration of Inde-

pendence. The year that marked his demise marked the entrance of the second great Democratic leader into the arena of politics.

Andrew Jackson (q.v.) of Tennessee, the hero of the War of 1812, had grown in fame and popularity from the day of his victory over the English at New Orleans. In 1824 he became the nominee of his party, and in the election following received 155,872 votes, as against 105,321 cast for John Quincy Adams; 44,282 cast for Crawford; and 46,587 cast for Henry Clay. In the Electoral College, Jackson received 99 votes, Adams 84, Crawford 41, and Clay 37. As no one of the candidates had a majority of the Electoral College the election of the President devolved upon the House of Representatives; and by a coalition between the friends of Adams and the friends of Clay, the former received the votes of 13 States, while Jackson received but 7 and Crawford 4.

The defeat of Jackson after he had secured a large plurality of the popular vote, and a considerable plurality in the Electoral College, aroused great partisan feeling, and from that time until 1828, Jackson was the candidate of the party, his campaign growing in strength as the years proceeded until when election day arrived he had a popular majority of nearly 140,000, and a majority of nearly 100 in the Electoral College. Calhoun was chosen Vice-President at the same time.

The chief features of Jackson's administration were his treatment of the nullification act of the South Carolina legislature, and his veto of the act for the rechartering of the United States bank. He took vigorous steps to enforce the Federal authority and, in an elaborate message, presented the arguments against the right of secession with a force and clearness never since surpassed. His action in this matter resulted in the alienation of John C. Calhoun, who up to that time had been a staunch political friend.

The fight over the bank charter not only occupied a large part of the time of his administration, but resulted in a controversy that permeated other issues. The Senate passed a resolution censuring him for removing the deposits from the bank, and this became an issue. Under the leadership of Thomas H. Benton, of Missouri, the Democrats began a fight for the reversal of the action of the Senate, and finally secured a majority of that body and expunged the resolution.

While Jackson's military achievements were the foundation for his early popularity, his great political fame was due to championing the cause of the masses, as against the concentrated power of wealth. In his message vetoing the bank charter he presented with emphasis and accuracy the Democratic view of the sphere of government. He said:

Distinctions in society will always exist under every just government. Equality of talents, of education, or of wealth, cannot be produced by human institutions. In the full enjoyment of the gifts of heaven and the fruits of superior industry, economy, and virtue every man is equally entitled to protection by law. But when the laws undertake to add to those natural and just advantages artificial distinctions—to grant titles, gratuities, and exclusive privileges—to make the rich richer and the potent more powerful—the humble members of society—the farmers, mechanics, and the laborers—who have neither the time nor the means of securing like favors for themselves,

DEMOCRATIC PARTY

have a right to complain of the injustice of their government.

Jackson's position on the bank charter represented the views of his party adherents. His veto was sent to Congress on 10 July 1831, and it was the main issue of the campaign of 1832, when with Henry Clay as his opponent he secured a popular plurality of 157,000. In the Electoral College he had 219 votes as against 49 cast for Clay. His secretary of state, Martin Van Buren, succeeded him as the Democratic candidate, and was elected, having both a popular majority and a majority in the Electoral College. Van Buren defeated William Henry Harrison in that year, and was defeated by him in the following campaign. In the earlier campaigns the nominations were made by a Congressional caucus, or by the various States, but Jackson's renomination in 1832 was made by a national convention held at Baltimore, and Van Buren was nominated by a convention held at the same place four years later.

In 1840 the Democratic convention was again held at Baltimore, Van Buren was renominated and a lengthy platform was adopted. As this platform was the basis of all platforms adopted from that time to the breaking out of the Civil War it is worthy of reproduction. It was as follows:

1. Resolved, That the Federal government is one of limited powers, derived solely from the Constitution, and the grants of powers shown therein ought to be strictly construed by all the departments and agents of the government, and that it is inexpedient and dangerous to exercise doubtful constitutional powers.

2. Resolved, That the Constitution does not confer upon the general government the power to commence and carry on a general system of internal improvements.

3. Resolved, That the Constitution does not confer authority upon the Federal government directly or indirectly, to assume the debts of the several States, contracted for local internal improvements or other State purposes; nor would such assumption be just or expedient.

4. Resolved, That justice and sound policy forbid the Federal government to foster one branch of industry to the detriment of another, or to cherish the interests of one portion to the injury of another portion of our common country—that every citizen and every section of the country has a right to demand and insist upon an equality of rights and privileges, and to complete an ample protection of persons and property from domestic violence or foreign aggression.

5. Resolved, That it is the duty of every branch of the government to enforce and practice the most rigid economy in conducting our public affairs, and that no more revenue ought to be raised than is required to defray the necessary expenses of the government.

6. Resolved, That Congress has no power to charter a United States bank; that we believe such an institution one of deadly hostility to the best interests of the country, dangerous to our Republican institutions, and the liberties of the people, and calculated to place the business of the country within the control of a concentrated money power and above the laws and the will of the people.

7. Resolved, That Congress has no power under the Constitution to interfere with or control the domestic institutions of the several States; and that such States are the sole and proper judges of everything pertaining to their own affairs, not prohibited by the Constitution; that all efforts by Abolitionists or others, made to induce Congress to interfere with questions of slavery or to take incipient steps in relation thereto, are calculated to lead to the most alarming and dangerous consequences, and that all such efforts have an inevitable tendency to diminish the happiness of the people, and endanger the stability and permanence of the Union, and ought not to be countenanced by any friend to our political institutions.

8. Resolved, That the separation of the moneys of the government from banking institutions is indispensable for the safety of the funds of the government and the rights of the people.

9. Resolved, That the liberal principles embodied by Jefferson in the Declaration of Independence, and sanctioned in the Constitution, which make ours the land of liberty and the asylum of the oppressed of every nation, have ever been cardinal principles in the Democratic faith; and every attempt to abridge the present privilege of becoming citizens, and the owners of soil among us ought to be resisted with the same spirit which swept the Alien and Sedition laws from our statute book.

As the names of several different persons had been presented for Vice-President the convention of 1840 made no nominations for that office, but advocated resolutions leaving the decision to members of the party in the various States, and trusting that "before the election took place the opinion would be so concentrated as to enable the Electoral College to secure the choice of a Vice-President."

Upon the death of Harrison, John Tyler became President, and during his term vetoed two bills, which had for their object the re-establishing of the United States bank. Tyler favored the annexation of Texas, which had separated from Mexico and had existed under an independent government since 1836. Jas. K. Polk, the Democratic candidate, also favored annexation, while Henry Clay, for a third time a candidate for the Presidency, opposed annexation.

In the platform of 1844, the first nine resolutions of the platform of 1840 were reaffirmed, and new resolutions added demanding, first, that the proceeds of public lands be sacredly applied to the national object specified in the Constitution, rather than distributed among the States; second, sustaining and defending the veto of the President which had "thrice saved the Americans from the corrupt and tyrannical domination of the banks of the United States, and third, declaring for the annexation of Texas. The campaign resulted in the election of Polk and Dallas, although the majority in the Electoral College was proportionately larger than the popular majority.

The campaign of 1848 was waged with Lewis Cass of Michigan and William O. Butler of Kentucky as the Democratic candidates for President and Vice-President. The platform of 1848 reaffirmed that of 1840 and 1844, and added new planks covering new questions. Resolution No. 19 of the platform of 1848 is given below because it reiterates the Democratic contention in regard to the value of self-government. It reads:

Resolved, That in view of the recent development of this grand political truth, of the sovereignty of the people and their capacity and power for self-government, which is prostrating thrones and erecting republics on the ruins of despotism in the Old World, we feel that a high and sacred duty is devolved, with increased responsibility, upon the Democratic party of this country, as the party of the people, to sustain and advance among us constitutional liberty, equality, and fraternity, by continuing to resist all monopolies and exclusive legislation for the benefit of the few at the expense of the many, and by a vigilant and constant adherence to those principles and compromises of the Constitution, which are broad enough and strong enough to embrace and uphold the Union as it was, the Union as it is, and the Union as it shall be, in the full expansion of the energies and capacity of this great and progressive people.

DEMOCRATIC PARTY

The Whig candidates, however, Zachary Taylor and Millard Fillmore, were successful that year, having both a popular majority and a majority in the Electoral College. In the campaign of 1852, Franklin Pierce of New Hampshire and William R. King of Alabama were the Democratic nominees, and the platform reiterated the leading planks of 1840, 1844 and 1848.

The platform of 1852 also reiterated the principles laid down in the Kentucky and Virginia resolutions, and defended the Mexican war "as just and necessary." The campaign of 1852 resulted in an overwhelming Democratic victory, the popular plurality being more than 200,000.

The slavery question was constantly growing in prominence, and at last exerted an influence upon every issue that arose. The position taken by the various parties in regard to the Mexican war was largely determined by the slavery views held by the members of the parties.

The Fugitive Slave laws of the various States also came up for consideration, and each election showed an increase in the anti-slavery sentiment. In 1856 the Democratic platform again reaffirmed the principles set forth in 1840, and reiterated in subsequent campaigns. It quoted resolution 7 of the platform of 1840, and said:

That the foregoing proposition covers, and was intended to embrace, the whole subject of slavery agitation in Congress; and, therefore, the Democratic party of the Union, standing on this national platform, will abide by, and adhere to, a faithful execution of the acts known as the compromise measures settled by the Congress of 1850; That "the act for reclaiming fugitives from service labor" included; which act, being designed to carry out an express provision of the Constitution, cannot, with fidelity thereto, be repealed, or so changed as to destroy or impair its efficiency; that the Democratic party will resist all attempts at renewing in Congress, or out of it, the agitation of the slavery question, under whatever shape or color the attempt may be made.

The Republican party took the name by which the Democratic party was originally known, and it held its first national convention in 1856, John C. Fremont and William L. Dayton being the nominees. James Buchanan and John C. Breckinridge were the Democratic nominees. They received a majority of 60 in the Electoral College and a popular plurality of about 500,000. The American party, led by Millard Fillmore and Andrew J. Donelson, secured only 8 electors but polled 874,000 votes. During the Buchanan administration the Dred Scott decision was rendered, and this, while it was a legal victory for the friends of slavery, resulted in an anti-slavery agitation that inured to the advantage of the Republican party.

In 1860 the conflict between the northern and southern Democrats became irreconcilable, and the Charlestown convention, which met 23 April, having failed to harmonize the differences, adjourned without a nomination. The northern Democrats met at Baltimore 18 June and nominated Stephen A. Douglas of Illinois for President and Herschel V. Johnson of Georgia for Vice President, while the southern wing of the party met at the same place 10 days later, and nominated John C. Breckinridge of Kentucky for President and Joseph Lane of Oregon for Vice-President. As the Douglas platforms adopted at that time represented the positions taken by the two wings of the party they will be found below:

1. Resolved, That we, the Democracy of the Union in convention assembled, hereby declare our affiance of the resolutions unanimously adopted and declared as a platform of principles by the Democratic convention at Cincinnati, in the year 1856, believing that Democratic principles are unchangeable in their nature when applied to the same subject matters; and we recommend, as the only further resolutions, the following:

Inasmuch as differences of opinion exist in the Democratic party as to the nature and extent of the powers of a Territorial legislature, and as to the powers and duties of Congress, under the Constitution of the United States, over the institution of slavery within the Territories.

2. Resolved, That the Democratic party will abide by the decisions of the Supreme Court of the United States on the question of constitutional law.

3. Resolved, That it is the duty of the United States to afford ample and complete protection to all its citizens, whether at home or abroad, and whether native or foreign.

4. Resolved, That one of the necessities of the age, in a military, commercial, and postal point of view, is speedy communication between the Atlantic and Pacific States; and the Democratic party pledge such constitutional government aid as will insure the construction of a railroad to the Pacific coast at the earliest practicable period.

5. Resolved, That the Democratic party are in favor of the acquisition of the island of Cuba, on such terms as shall be honorable to ourselves and just to Spain.

6. Resolved, That the enactments of State legislatures to defeat the faithful execution of the Fugitive Slave Law are hostile in character, subversive of the Constitution, and revolutionary in their effect.

7. Resolved, That it is in accordance with the true interpretation of the Cincinnati platform, that, during the existence of the Territorial governments, the measure of restriction, whatever it may be, imposed by the Federal Constitution on the power of the Territorial legislature over the subject of domestic relations, as the same has been or shall hereafter be finally determined by the Supreme Court of the United States, shall be respected by all good citizens, and enforced with promptness and fidelity by every branch of the general government.

The "Breckinridge platform" was as follows:

Resolved, That the platform adopted by the Democratic party at Cincinnati be affirmed, with the following explanatory resolutions:

1. That the government of a Territory, organized by an act of Congress is provisional and temporary; and, during its existence, all citizens of the United States have an equal right to settle, with their property in the Territory, without their rights, either of person or property, being destroyed or impaired by congressional or territorial legislation.

2. That it is the duty of the Federal government, in all its departments, to protect when necessary, the rights of persons and property in the Territories, and wherever else its constitutional authority extends.

3. That when the settlers in a Territory having an adequate population, form a State Constitution in pursuance of law, the right of sovereignty commences, and, being consummated by admission into the Union, they stand on an equal footing with the people of the other States, and the State thus organized ought to be admitted into the Federal Union, whether its Constitution prohibits or recognizes the institution of slavery.

4. That the Democratic party are in favor of the acquisition of the island of Cuba, on such terms as shall be honorable to ourselves, and just to Spain, at the earliest practicable moment.

5. That the enactments of State legislatures to defeat the faithful execution of the Fugitive Slave law are hostile in character, subversive of the Constitution and revolutionary in their effect.

6. That the Democracy of the United States recognize it as the imperative duty of this government to protect the naturalized citizens in all their rights, whether at home or in foreign lands, to the same extent as its native-born citizens.

Whereas, One of the greatest necessities of the age, in a political, commercial, postal, and military point of view, is a speedy communication between the Pacific and Atlantic coasts; therefore be it

DEMOCRATIC PARTY

Resolved, That the Democratic party do hereby pledge themselves to use every means in their power to secure the passage of some bill to the extent of the constitutional authority of Congress, for the construction of a Pacific railroad, from the Mississippi River to the Pacific Ocean, at the earliest practicable moment.

It will be seen that both conventions reaffirmed the Cincinnati platform of 1856. It will also be noticed that the only difference between the platforms grew out of the slavery question, the Douglas platform leaving the question to the Supreme Court, promising to abide by its decision; the Breckinridge platform declaring that the people of a territory had the right to decide the slavery question for themselves, and also declaring that the citizens of the various States had the right to settle in a territory and carry their property with them (meaning slaves) without being interfered with by congressional action.

The election of 1860 resulted in a victory for the Republican party, whose candidates, Abraham Lincoln and Hannibal Hamlin, ran upon a platform denouncing "threats of disunion," and saying that "the new dogma, that the Constitution, of its own force, carries slavery into any or all of the Territories of the United States," was a "dangerous political heresy." The platform did not call for the abolition of slavery in the States where it existed, but asserted "that the normal condition of all the territory of the United States is that of freedom; that as our Republican fathers, when they had abolished slavery in all our national territory, ordained that 'no person shall be deprived of life, liberty or property, without due process of law,' it becomes our duty by legislation, whenever such legislation is necessary, to maintain this provision of the Constitution against all attempts to violate it; and we deny the authority of Congress, of a territorial legislature, or any individuals, to give legal existence to slavery in any Territory of the United States."

Lincoln received a popular plurality of nearly 500,000, and a plurality of 108 in the Electoral College. Douglas came second in the popular vote, but fell behind both the Breckinridge ticket and Bell and Everett ticket in the Electoral College. This was due to the fact that the Douglas vote was large in the States which Lincoln carried.

In the war between the States the supporters of Douglas enlisted side by side with the supporters of Lincoln, Douglas himself having urged the support of Lincoln in the war for the maintenance of the Union. During the War, however, many things were done which aroused criticism from the Democratic leaders, and by the Democrats generally. Among the things complained of were arrests and courts-martial in States not in insurrection, and where the civil authority was undisturbed.

The Democratic platform of 1864 announced "unswerving fidelity to the Union under the Constitution, as the only solid foundation of our strength, security and happiness as a people, and as a framework of government equally conducive to the welfare and prosperity of all the States, both Northern and Southern"; and then declared

as the sense of the American people, that after four years of failure to restore the Union by the experiment of war, during which, under the pretense of a military

necessity of a war power higher than the Constitution, the Constitution itself has been disregarded in every part and public liberty and private right alike trodden down, and the material prosperity of the country essentially impaired, justice, humanity, liberty, and the public welfare demand that immediate efforts be made for a cessation of hostilities, with a view to an ultimate convention of all the States, or other peaceable means, to the end that, at the earliest practicable moment, peace may be restored on the basis of the Federal union of all the States.

Gen. George B. McClellan of New Jersey was nominated by the Democratic party for President and George H. Pendleton of Ohio for Vice-President. The election resulted in a popular majority of 408,000 for the Republican ticket, and in an electoral majority of 191—Kentucky, New Jersey and Delaware being the only three of the 24 States giving their electoral vote to the Democratic ticket. It will be seen that the Republican plurality was less than it was in 1860.

The assassination of Abraham Lincoln and the inauguration of Vice-President Andrew Johnson (q.v.) as President precipitated a struggle in which most of the Republican senators and members of Congress were arrayed against the President. The Democrats took the side of the President, and with the aid of a few Republicans prevented the adoption of the articles of impeachment presented by the House.

During the reconstruction period that followed, the Democrats insisted that the States which were held in the Union should be given the rights and privileges of other States.

The campaign of 1868 was fought under the leadership of Horatio Seymour of New York and Francis P. Blair of Missouri, and the platform demanded:

1. Immediate restoration of all the States to their rights in the Union under the Constitution, and of civil government to the American people.
2. Amnesty for all past political offenses, and the regulation of the elective franchise in the States by their citizens.
3. Payment of all the public debt of the United States as rapidly as practicable—all money drawn from the people by taxation, except so much as is requisite for the necessities of the government, economically administered, being honestly applied to such payment; and when the obligations of the government do not expressly state upon their face, or the law under which they were issued does not provide that they shall be paid in coin, they ought, in right and justice, to be paid in the lawful money of the United States.
4. Equal taxation of every species of property according to its real value, including government bonds and other public securities.
5. One currency for the government and the people, the laborer and the office-holder, the pensioner, and the soldier, the producer and the bondholder.
6. Economy in the administration of the government; the reduction of the standing army and navy; the abolition of the Freedman's Bureau and all political instrumentalities designed to secure negro supremacy; simplification of the system and discontinuance of inquisitorial modes of assessing and collecting internal revenue; that the burden of taxation may be equalized and lessened, and the credit of the government and the currency made good; the repeal of all enactments for enrolling the State militia into national forces in times of peace; and a tariff for revenue upon foreign imports, and such equal taxation under the internal-revenue laws as will afford incidental protection to domestic manufactures, and as will, without impairing the revenue, impose the least burden upon, and best promote and encourage the great industrial interests of the country.
7. Reform of abuses in the administration; the expulsion of corrupt men from office; the abrogation of useless offices; and the restoration of rightful author-

DEMOCRATIC PARTY

ity to, and the independence of, the executive and judicial departments of the government; the subordination of the military to the civil power, to the end that the usurpations of Congress and the despotism of the sword may cease.

8. Equal rights and protection for naturalized and native-born citizens, at home and abroad; the assertion of American nationality which shall command the respect of foreign powers, and furnish an example and encouragement to people struggling for national integrity, constitutional liberty, and individual rights; and the maintenance of the rights of naturalized citizens against the absolute doctrine of immutable allegiance and the claims of foreign powers to punish them for alleged crimes committed beyond their jurisdiction.

Besides this statement of the position of the parties, the platform arraigned the Republican party for its reconstruction policy, charging that instead of restoring the Union it had "so far as was in its power dissolved it and subjected 10 States in time of profound peace to military despotism and negro supremacy," and that it had "nullified the right of trial by jury, abolished the right of *habeas corpus* and overthrown the freedom of speech and press." The Republicans nominated Gen. Grant and Schuyler Colfax, and secured a popular plurality of about 300,000 (less than the plurality of 1864), and an electoral majority of 134.

In May 1872, a convention known as the Liberal Republican Convention was held at Cincinnati, Ohio, and nominated Horace Greeley of New York for President and Benjamin Gratz Brown of Missouri for Vice-President. The platform demanded the recognition of the doctrines of equality of all men before the law, and pledged the party's support to Articles 13, 14 and 15 of our amended national Constitution. It favored the sacred maintenance of the public credit, opposed repudiation and insisted upon the return to specie payments.

The Democrats met on 9 July at Baltimore and nominated the same ticket and adopted a platform substantially like the one adopted by the Liberal Republicans.

Those members of the Democratic party describing themselves as "straight-out" Democrats met 3 September following, and nominated Charles O'Connor of New York for President and John Quincy Adams of Massachusetts for Vice-President; although both declined, nearly 30,000 votes were cast for the head of the ticket. The platform declared that the Baltimore convention had betrayed the party into a false creed and false leadership, and proclaimed that the members of the "straight-out" Democratic party preferred principle to power, and would not surrender those principles in exchange for offices which Presidents confer." The election resulted in an overwhelming victory for the Republican ticket, Grant and Wilson receiving 286 electoral votes out of 317, and a popular plurality of more than 750,000.

The nomination of Horace Greeley brought to his party a large number of influential Republicans and alienated many Democrats, yet the party's vote was only about 125,000 more than the Democratic vote of 1868; while the Republican vote of 1872 was nearly 600,000 greater than the vote of four years before.

The Democrats entered the campaign of 1876 with courage and confidence. The discovery of corruption in several of the departments, and the conviction of officials high in authority, together with the panic of 1873, had broken the

prestige of the Republican party and caused a wide-spread demand for reform. The Democratic party took advantage of the situation, and nominated as its candidates Samuel J. Tilden of New York, who had become conspicuous in reform in his State, and Thomas A. Hendricks of Indiana, who represented all that was highest, purest and best in Democratic principle and purpose. The platform described the abuses of power and demanded reform in every department. Among other things it demanded reform in the tariff, and condemned the resumption clause of 1875.

The campaign resulted in a popular plurality of 250,000 for Tilden and Hendricks. The result, however, was disputed, and charges of fraud were made in the election of several States. The situation grew so serious that Congress created an Electoral Commission to which the whole matter was referred. This commission was composed of five senators selected by that body, five members of Congress selected by that body, and the five senior members of the Supreme Court. (See ELECTORAL COMMISSION.)

The Senate being Republican selected 3 Republicans and 2 Democrats; the House being Democratic selected 3 Democrats and 2 Republicans, and of the judges 3 were Republicans and 2 Democrats. The Electoral Commission thus contained 8 Republicans and 7 Democrats, and on every contested question the vote stood 8 to 7, each member throwing his vote so that it would aid his party.

The Democrats of 1880 endorsed the principles embodied in the platform of 1876, protested against centralization as dangerous to the government, and denounced the "great fraud of 1876 and 1877 by which upon a false count of the electoral votes of two States the candidate defeated at the polls was declared to be President, and for the first time in American history the will of the people was set aside under a threat of military violence." The righting of the wrong of 1876 was declared to be the paramount issue. Gen. Winfield Scott Hancock, the Democratic nominee, weakened his campaign by putting the tariff question aside as "a local issue." He was defeated, however, by a popular vote of less than 10,000, and only by 59 votes in the Electoral College.

In 1884 the Democrats met at Chicago and nominated Grover Cleveland of New York for President and Thomas A. Hendricks of Indiana for Vice-President. A platform of great length was adopted; the tariff question being the one discussed at most length. The platform contained the following plank on the money question: "We believe in honest money, the gold and silver coinage of the Constitution, and a circulating medium convertible into such money without loss." This platform also contained a plank reaffirming that portion of the Democratic platform of 1856, which endorsed the liberal principles of Jefferson.

The Republican ticket, headed by James G. Blaine and John A. Logan, received a plurality of a little more than 20,000 in the popular vote, but Mr. Cleveland had 37 majority in the Electoral College.

The Democratic platform of 1888 reaffirmed the platform adopted in 1884, and endorsed the President's views on the tariff question as ex-

DEMOCRATIC PARTY

pressed in the tariff message which he sent to Congress in December 1887. The tariff question was made the paramount issue, and the campaign waged on this question, and resulted in the election of the Republican ticket, and its candidates, Benjamin Harrison and Levi P. Morton, that ticket having a majority of 65 in the Electoral College, although the Democratic ticket had a popular plurality of about 100,000.

During the Cleveland administration an attempt was made to reduce the tariff, and the Mills Bill received the support of the Democratic members of the Senate and House. The Republicans, however, took advantage of the Republican victory of 1888 to propose and enact a high tariff law, known as the McKinley Act, taking its name from the chairman of the Ways and Means Committee of the House. The passage of this law was followed by an increase in prices of commodities, and it became the paramount issue in the following campaign of 1892. The Democratic party that year nominated Grover Cleveland for a third time, and named Adlai E. Stevenson of Illinois as his running mate.

There was a fight in the convention over the tariff plank, and as finally adopted it declared that the Federal government had no constitutional power to impose and collect tariff duties except for revenue only. The trusts were denounced, and the party pledged to the enactment of laws made to prevent and control them.

The money plank of the platform was as follows:

We denounce the Republican legislation known as the Sherman Act of 1890 as a cowardly makeshift, fraught with possibilities of danger in the future which should make all of its supporters, as well as its author, anxious for its speedy repeal. We hold to the use of both gold and silver as the standard money of the country, and to the coinage of both gold and silver without discrimination against either metal or charge for mintage, but the dollar unit of coinage of both metals must be of equal intrinsic and exchangeable value or be adjusted through international agreement, or by such safeguards of legislation as shall ensure the maintenance of the parity of the two metals, and the equal power of every dollar at all times in the markets and in the payments of debts; and we demand that all paper currency shall be kept at par with and redeemable in such coin. We insist upon this policy as especially necessary for the protection of the farmers and laboring classes, the first and most defenseless victims of unstable money and a fluctuating currency.

President Harrison was renominated by the Republicans and Whitelaw Reid was placed upon the ticket with him. In the election the Democratic ticket polled a plurality of 132 in the Electoral College and popular plurality of about 380,000. The People's Party nominated James B. Weaver of Iowa for President and James G. Field of Virginia for Vice-President, and polled a little more than 1,000,000 votes.

During President Cleveland's second term, two questions occupied public attention, the money question and the tariff question. Congress was called together in extraordinary session in August 1893, and the President recommended the unconditional repeal of the Sherman law. By reference to the Democratic platform of 1892 it will be seen that the money plank contained a statement of the party's faith in the double standard, as well as its desire for the repeal of

the Sherman Act, and an effort to repeal the makeshift without restoring the double standard caused a division in the ranks of the party, but the President succeeded in securing the legislation which he desired; doing this, however, he had the support of a larger percentage of the Republican senators and members than he had of the Democrats.

Congressman Wilson, chairman of the Ways and Means Committee, reported a measure which bears his name, and the bill as it passed the House was satisfactory to the friends of tariff reform, but it was emasculated by the Senate, where a coterie of Democratic senators refused to support it until the rates of several schedules were raised. The President refused to sign the bill, but allowed it to become a law without his signature. The bill contained an income tax, but this clause was declared unconstitutional by the Supreme Court, the vote standing 5 to 4. The decision was rendered at the second hearing; at the first hearing the vote stood 4 to 4, and as the 9th judge who was not present until the second hearing favored the tax, it required a change of opinion on the part of one of the judges to render the income tax inoperative.

After the passage of the tariff law the currency question again occupied the attention of Congress and became the paramount issue in the campaign of 1896. The money issue was fought out in the party and the delegates to the Chicago convention were instructed to carry out the financial policy endorsed by the members of the State convention selecting them, who in turn had been instructed by county conventions. As a result of this inter-party contest, the advocates of bimetallism won a decisive victory, having more than two thirds of the national delegates.

The following platform was adopted:

We, the Democrats of the United States in National Convention assembled, do reaffirm our allegiance to those great essential principles of justice and liberty, upon which our institutions are founded, and which the Democratic party has advocated from Jefferson's time to our own—freedom of speech, freedom of press, freedom of conscience, the preservation of personal rights, the equality of all citizens before the law, and the faithful observance of constitutional limitations.

During all these years the Democratic party has resisted the tendency of selfish interests to the centralization of governmental power, and steadfastly maintained the integrity of the dual scheme of government established by the founders of this Republic of republics. Under its guidings and teachings the great principle of local self-government has found its best expression in the maintenance of the rights of the States and in its assertion of the necessity of confining the general government to the exercise of the powers granted by the Constitution of the United States.

The Constitution of the United States guarantees to every citizen the rights of civil and religious liberty. The Democratic party has always been the exponent of political liberty and religious freedom, and it renews its obligations and reaffirms its devotions to these fundamental principles of the Constitution.

Recognizing that the money question is paramount to all others at this time, we invite attention to the fact that the Federal Constitution named silver and gold together as the money metals of the United States, and that the first coinage law passed by Congress under the Constitution made the silver dollar the monetary unit and admitted gold to free coinage at a ratio based upon the silver-dollar unit.

We declare that the act of 1873 demonetizing silver without the knowledge or approval of the American people has resulted in the appreciation of gold and a corresponding fall in the prices of commodities produced by the people; a heavy increase in the burden of taxation and of all debts, public and private; the

DEMOCRATIC PARTY

enrichment of the money-lending class at home and abroad; the prostration of industry and impoverishment of the people.

We are unalterably opposed to monometallism, which has locked fast the prosperity of an industrial people in the paralysis of hard times. Gold monometallism is a British policy, and its adoption has brought other nations into financial servitude to London. It is not only un-American, but anti-American, and it can be fastened on the United States only by the stifling of that spirit and love of liberty which proclaimed our political independence in 1776 and won it in the War of the Revolution.

We demand the free and unlimited coinage of both silver and gold at the present legal ratio of 16 to 1 without waiting for the aid or consent of any other nation. We demand that the standard silver dollar shall be a full legal tender, equally with gold, for all debts, public and private, and we favor such legislation as will prevent for the future the demonetization of any kind of legal-tender money by private contract.

We are opposed to the policy and practice of surrendering to the holders of the obligations of the United States the option reserved by law to the government of redeeming such obligations in either silver coin or gold coin.

We are opposed to the issuing of interest-bearing bonds of the United States in time of peace and condemn the trafficking with banking syndicates, which, in exchange for bonds and at an enormous profit to themselves, supply the Federal treasury with gold to maintain the policy of gold monometallism.

Congress alone has the power to coin and issue money, and President Jackson declared that this power could not be delegated to corporations or individuals. We, therefore, denounce the issuance of notes intended to circulate as money by national banks as in derogation of the Constitution, and we demand that all paper which is made a legal tender for public and private debts, or which is receivable for dues to the United States, shall be issued by the government of the United States and shall be redeemable in coin.

We hold that tariff duties shall be levied for purposes of revenue, such duties to be so adjusted as to operate equally throughout the country, and not discriminate between class or section, and that taxation should be limited by the needs of the government, honestly and economically administered. We denounce as disturbing to business the Republican threat to restore the McKinley law, which has twice been condemned by the people in national elections, and which, enacted under the false plea of protection to home industry, proved a prolific breeder of trusts and monopolies, enriched the few at the expense of the many, restricted trade and deprived the producers of the great American staples of access to their natural markets.

Until the money question is settled we are opposed to any agitation for further changes in our tariff laws, except such as is necessary to meet the deficit in revenue caused by the adverse decision of the Supreme Court on the income tax. But for this decision by the Supreme Court there would be no deficit in the revenue under the law passed by a Democratic Congress in strict pursuance of the uniform decisions of that court for nearly two years, that court having in that decision sustained constitutional objections to its enactment which had previously been overruled by the ablest judges who have ever sat on that bench. We declare that it is the duty of Congress to use all the constitutional power which remains after that decision, or which may come from its reversal by the court as it may hereafter be constituted, so that the burdens of taxation may be equally and impartially laid, to the end that wealth may bear its due proportion of the expense of the government.

We hold that the most efficient way of protecting American labor is to prevent the importation of foreign pauper labor to compete with it in the home market, and that the value of the home market to our American farmers and artisans is greatly reduced by a vicious monetary system which depresses the prices of their products below the cost of production, and thus deprives them of the means of purchasing the products of our home manufactures; and as labor creates the wealth of the country, we demand the passage of such laws as may be necessary to protect it in all its rights.

We are in favor of the arbitration of differences between employers engaged in interstate commerce and their employees, and recommend such legislation as is necessary to carry out this principle.

The absorption of wealth by the few, the consolidation of our leading railroad systems, and the formation of trusts and pools require a stricter control by the Federal government of those arteries of commerce. We demand the enlargement of the power of the Interstate Commerce Commission and such restriction and guarantees in the control of railroads as will protect the people from robbery and oppression.

We denounce the profligate waste of the money wrung from the people by oppressive taxation and the lavish appropriations of recent Republican congresses, which have kept taxes high, while the labor that pays them is unemployed and the products of the people's toil are depressed in price till they no longer repay the cost of production. We demand a return to that simplicity and economy which befits a Democratic government and a reduction in the number of useless offices the salaries of which drain the substance of the people.

We denounce arbitrary interference by Federal authorities in local affairs as a violation of the Constitution of the United States and a crime against free institutions, and we especially object to government by injunction as a new and highly dangerous form of oppression by which the Federal judges, in contempt of the laws of the States and rights of citizens, become at once legislators, judges, executioners; and we approve the bill passed at the last session of the United States Senate, and now pending in the House of Representatives, relative to contempts in Federal courts and providing for trials by jury in certain cases of contempt.

No discrimination should be indulged in by the government of the United States in favor of any of its debtors. We approve of the refusal of the Fifty-third Congress to pass the Pacific Railroad Funding Bill and denounce the effort of the present Republican Congress to enact a similar measure.

Recognizing the just claims of deserving Union soldiers, we heartily endorse the rule of the present commissioner of pensions, that no names shall be arbitrarily dropped from the pension roll; and the fact of enlistment and service should be deemed conclusive evidence against disease and disability before enlistment.

We favor the admission of the Territories of New Mexico, Arizona, and Oklahoma into the Union as States, and we favor the early admission of all the Territories having the necessary population and resources to entitle them to Statehood, and, while they remain Territories, we hold that the officials appointed to administer the government of any Territory, together with the District of Columbia and Alaska, should be *bona fide* residents of the Territory or District in which their duties are to be performed. The Democratic party believes in home rule and that all public lands of the United States should be appropriated to the establishment of free homes for American citizens.

We recommend that the Territory of Alaska be granted a delegate in Congress and that the general land and timber laws of the United States be extended to said Territory.

The Monroe Doctrine, as originally declared, and as interpreted by succeeding Presidents, is a permanent part of the foreign policy of the United States and must at all times be maintained.

We extend our sympathy to the people of Cuba in their heroic struggle for liberty and independence.

We are opposed to life tenure in the public service, except as provided in the Constitution. We favor appointments based on merit, fixed terms of office, and such an administration of the civil-service laws as will afford equal opportunities to all citizens of ascertained fitness.

We declare it to be the unwritten law of this Republic, established by custom and usage of one hundred years and sanctioned by the examples of the greatest and wisest of those who founded and have maintained our government, that no man should be eligible for a third term of the Presidential office.

The Federal government should care for and improve the Mississippi River and other great waterways of the Republic, so as to secure for the interior States easy and cheap transportation to tide water. When any waterway of the Republic is of sufficient importance to demand aid of the government, such aid should be extended upon a definite plan of continuous work until permanent improvement is secured.

Confiding in the justice of our cause and the necessity of its success at the polls, we submit the foregoing declaration of principles and purposes to the considerate judgment of the American people. We invite the support of all citizens who approve them and who desire to have them made effective through legislation,

DEMOCRATIC PARTY

for the relief of the people and the restoration of the country's prosperity.

The minority, led by Senator Hill of New York, submitted the following, which was refused by the convention:

To the Democratic National Convention: 16 delegates, constituting the minority of the Committee on Resolutions, find many declarations in the report of the majority to which they cannot give their assent. Some of these are wholly unnecessary. Some are ill considered and ambiguously phrased, while others are extreme and revolutionary of the well-recognized principles of the party. The minority content themselves with this general expression of their dissent, without going into a specific statement of the objectionable features of the report of the majority; but upon the financial question, which engages at this time the chief share of public attention, the views of the majority differ so fundamentally from what the minority regard as vital Democratic doctrine as to demand a distinct statement of what they hold to as the only just and true expression of Democratic faith upon the paramount issue, as follows, which is offered as a substitute for the financial plank in the majority report:

"We declare our belief that the experiment on the part of the United States alone of free silver coinage and a change of the existing standard of value independently of the action of other great nations, would not only imperil our finances, but would retard or entirely prevent the establishment of international bimetalism, to which the efforts of the government should be steadily directed. It would place this country at once upon a silver basis, impair contracts, disturb business, diminish the purchasing power of the wages of labor, and inflict irreparable evils upon our nation's commerce and industry.

"Until international co-operation among leading nations for the coinage of silver can be secured we favor the rigid maintenance of the existing gold standard as essential to the preservation of our national credit, the redemption of our public pledges, and the keeping inviolate of our country's honor. We insist that all our paper and silver currency shall be kept absolutely at a parity with gold. The Democratic party is the party of hard money and is opposed to legal tender paper money as a part of our permanent financial system, and we therefore favor the gradual retirement and cancellation of all United States notes and Treasury notes, under such legislative provisions as will prevent undue contraction. We demand that the national credit shall be resolutely maintained at all times and under all circumstances."

The minority also feel that the report of the majority is defective in failing to make any recognition of the honesty, economy, courage and fidelity of the present Democratic administration. And they therefore offer the following declaration as an amendment to the majority report: "We commend the honesty, economy, courage and fidelity of the present Democratic National Administration."

The main resolutions submitted by the minority were rejected by more than a two thirds vote, and the platform as reported by the committee was adopted by the same vote. The resolution endorsing the President was defeated by a little less than two thirds.

The convention named as its candidates William Jennings Bryan of Nebraska, and Arthur Sewall of Maine. The "National" Democrats met at Indianapolis in September following, issued a platform endorsing the gold standard and named John M. Palmer and Simon B. Buckner as their national ticket. William McKinley of Ohio, and Garrett A. Hobart of New Jersey were the nominees of the Republican convention. The platform contained a plank favoring a protective tariff, and a plank opposing free coinage until foreign co-operation could be secured, but pledging the party to promote international bimetalism.

The People's party, generally known as the Populist party, met at St. Louis and adopted a platform containing the same silver plank as the

Democratic platform and endorsed and nominated the Democratic candidate for President. Instead of endorsing Mr. Sewall for the Vice-Presidency, the convention named Thomas E. Watson of Georgia for that office. The Silver Republicans met at the same time, endorsed the Democratic ticket and adopted a silver plank identical with the Democratic plank.

The campaign aroused deep feeling on both sides, and was warmly contested in the Central States. It became apparent early in the campaign that the Democratic ticket would carry the Western and Southern States, and that the Republican ticket would sweep the Eastern States. A very large vote was polled, the total that year being nearly 2,000,000 in excess of the total vote of four years before. The Republican party secured a popular plurality of 603,514. The electoral vote stood, McKinley and Hobart 271; Bryan and Sewall, 176.

Between 1896 and 1900 there was an improvement in industrial conditions; an increase in the volume of money, and a series of wars throughout the world. In 1898 the United States interfered in behalf of the Cubans and became involved in a war with Spain, which war resulted in Cuban independence, but during the war a naval victory in the Philippines put this nation in temporary control of those islands and resulted in our possession of them as an indemnity for the expenses incurred in behalf of the Cubans. The cession of the Philippine Islands to the United States raised a question which has not yet been settled. The sentiment is at present divided, the Democrats favoring the immediate promise that independence will be given as soon as a stable government is established, this independence to be accompanied by protection from outside interference. Some of the Republicans desire that the Philippine Islands be held under a colonial system, and others desire that the islands be given a territorial form of government with a view to ultimate statehood.

The Democratic convention which met at Kansas City 4 July 1900 endorsed the Declaration of Independence, and adopted the following platform:

"We, the representatives of the Democratic party of the United States, assembled in national convention on the anniversary of the adoption of the Declaration of Independence, do reaffirm our faith in that immortal proclamation of the inalienable rights of man and our allegiance to the Constitution framed in harmony therewith by the fathers of the Republic. We hold with the United States Supreme Court that the Declaration of Independence is the spirit of our government, of which the Constitution is the form and letter.

We declare again that all governments instituted among men derive their just powers from the consent of the governed; that any government not based upon the consent of the governed is tyranny, and that to impose upon any people a government of force is to substitute the methods of imperialism for those of a republic. We hold that the Constitution follows the flag, and denounce the doctrine that an Executive or Congress, deriving their existence and their powers from the Constitution, can exercise lawful authority beyond it or in violation of it.

We assert that no nation can long endure half republic and half empire, and we warn the American people that imperialism abroad will lead quickly and inevitably to despotism at home.

Believing in these fundamental principles, we denounce the Porto Rican law, enacted by a Republican Congress against the protest and opposition of the Democratic minority, as a bold and open violation of the nation's organic law and a flagrant breach of the national good faith. It imposes upon the people of

DEMOCRATIC PARTY

Porto Rico a government without their consent and taxation without representation. It dishonors the American people by repudiating a solemn pledge made in their behalf by the commanding general of our army, which the Porto Ricans welcomed to a peaceful and unresisted occupation of their land. It doomed to poverty and distress a people whose helplessness appeals with peculiar force to our justice and magnanimity.

In this, the first act of its imperialistic programme, the Republican party seeks to commit the United States to a colonial policy inconsistent with republican institutions and condemned by the Supreme Court in numerous decisions.

We condemn and denounce the Philippine policy of the present administration. It has involved the public in unnecessary war, sacrificed the lives of many of our noblest sons and placed the United States, previously known and applauded throughout the world as the champion of freedom, in the false and un-American position of crushing with military force the efforts of our former allies to achieve liberty and self-government. The Filipinos cannot be citizens without endangering our civilization; they cannot be subjects without imperiling our form of government, and as we are not willing to surrender our civilization or to convert the republic into an empire, we favor an immediate declaration of the nation's purpose to give the Filipinos, first, a stable form of government; second, independence; and, third, protection from outside interference, such as has been given for nearly a century to the republics of Central and South America.

We are not opposed to territorial expansion when it takes in desirable territory which can be erected into States in the Union and whose people are willing and fit to become American citizens. We favor expansion by every peaceful and legitimate means. But we are unalterably opposed to seizing or purchasing distant islands to be governed outside the Constitution and whose people can never become citizens.

We are in favor of extending the Republic's influence among the nations, but believe that influence should be extended, not by force and violence, but through the persuasive power of a high and honorable example. The importance of other questions now pending before the American people is no wise diminished, and the Democratic party takes no backward step from its position on them, but the burning issue of imperialism growing out of the Spanish war involves the very existence of the republic and the destruction of our free institutions. We regard it as the paramount issue of the campaign.

The declaration in the Republican platform adopted at the Philadelphia convention, held in June 1900, that the Republican party "steadfastly adheres to the policy announced in the Monroe Doctrine," is manifestly deceptive. This profession is contradicted by the avowed policy of that party, in opposition to the spirit of the Monroe Doctrine, to acquire and hold sovereignty over large areas of territory and large numbers of people in the eastern hemisphere. We insist on the strict maintenance of the Monroe Doctrine in all its integrity, both in letter and in spirit, as necessary to prevent the extension of European authority on this continent and as essential to our supremacy in American affairs. At the same time we declare that no American people shall ever be held by force in unwilling subjection to European authority.

We oppose militarism. It means conquest abroad and intimidation and oppression at home. It means the strong arm which has ever been fatal to free institutions. It is what millions of our citizens have fled from in Europe. It will impose upon our peace-loving people a large standing army and unnecessary burden of taxation, and will be a constant menace to their liberties. A small standing army and a well disciplined State militia are amply sufficient in time of peace. This republic has no place for a vast military service and conscription.

In time of danger the volunteer soldier is his country's best defender. The National Guard of the United States should ever be cherished in the patriotic hearts of a free people. Such organizations are ever an element of strength and safety. For the first time in our history and coeval with the Philippine conquest has there been a wholesale departure from our time-honored and approved system of volunteer organization. We denounce it as un-American, un-Democratic and un-Republican and as a subversion of the ancient and fixed principles of a free people.

Private monopolies are indefensible and intolerable. They destroy competition, control the price of all

material and of the finished product, thus robbing both producer and consumer. They lessen the employment of labor, and arbitrarily fix the terms and conditions thereof, and deprive individual energy and small capital of their opportunity for betterment. They are the most efficient means yet devised for appropriating the fruits of industry to the benefit of the few at the expense of the many, and unless their insatiable greed is checked all wealth will be aggregated in a few hands and the republic destroyed.

The dishonest paltering with the trust evil by the Republican party in State and national platforms is conclusive proof of the truth of the charge that trusts are the legitimate product of Republican policies, that they are fostered by Republican laws, and that they are protected by the Republican administration for campaign subscriptions and political support.

We pledge the Democratic party to an unceasing warfare in nation, State and city against private monopoly in every form. Existing laws against trusts must be enforced, and more stringent ones must be enacted providing for publicity as to the affairs of corporations engaged in interstate commerce, requiring all corporations to show, before doing business outside the State of their origin, that they have no water in their stock, and that they have not attempted, and are not attempting, to monopolize any branch of business or the production of any articles of merchandise, and the whole constitutional power of Congress over interstate commerce, the mails and all modes of interstate communication shall be exercised by the enactment of comprehensive laws upon the subject of trusts.

Tariff laws should be amended by putting the products of trusts upon the free list, to prevent monopoly under the plea of protection.

The failure of the present Republican administration, with an absolute control over all the branches of the national government, to enact any legislation designed to prevent or even curtail the absorbing power of trusts and illegal combinations, or to enforce the anti-trust laws already on the statute books, proves the insincerity of the high-sounding phrases of the Republican platform.

Corporations should be protected in all their rights, and their legitimate interests should be respected, but any attempt by corporations to interfere with public affairs of the people or to control the sovereignty which creates them should be forbidden under such penalties as will make such attempts impossible.

We condemn the Dingley tariff law as a trust-breeding measure, skillfully devised to give the few favors which they do not deserve and to place upon the many burdens which they should not bear.

We favor such an enlargement of the scope of the interstate commerce law as will enable the commission to protect individuals and communities from discriminations and the public from unjust and unfair transportation rates.

It will be seen that the question of imperialism was made the paramount issue, the trust question coming next in the amount of attention given to it. The convention, however, reaffirmed the principles embodied in the Chicago platform, and reiterated the position taken four years before on the money question and on several other questions.

Mr. Bryan was renominated and Adlai E. Stevenson of Illinois was placed upon the ticket as the candidate for Vice-President. This ticket was endorsed later by the People's Party convention, and by the Silver Republican convention, both of which parties adopted platforms in line with the Democratic platform upon the leading issues. The Democratic ticket was also endorsed by the Anti-imperialists.

While the Democrats tried to focus public attention upon the menace of imperialism, the Republicans said: "Let well enough alone," and credited the improved conditions of the people in part to the gold standard and in part to the high-tariff law enacted in 1898. They protested against any change in the financial laws or the tariff law, and denied that they intended any

DEMOCRATIC SOCIETIES IN THE UNITED STATES—DEMOCRITUS

departure from the principles of free government.

The Republican ticket, headed by President McKinley and Theodore Roosevelt of New York, was again successful, the popular plurality being 849,455. The electoral vote stood, McKinley and Roosevelt 292, Bryan and Stevenson 155. The campaign of 1900 did not excite as much interest as the preceding campaign, the total vote being practically the same in 1900 as it was in 1896.

In the foregoing narrative an attempt has been made to present a history of the Democratic party from its organization to the present time, and the party's position on public issues has been shown by quotations from the platforms adopted by its national conventions. While platforms are not so specific as laws, and not so elaborate as speeches, they are probably a better index to the general thought and purpose of parties than either laws and speeches—for the reason that laws are often compromises, and speeches may represent the individual opinions of the speakers rather than the conclusion of the party, while platforms are written by delegates chosen for that purpose.

It will be seen that the party has met with successes and reverses, but it is also noticeable that it has adhered to its principles regardless of the immediate effect of those principles upon it. For instance, it was defeated in 1840, and yet the platform of 1840 was constantly reaffirmed and reiterated for 20 years afterward. The platform of 1892 reaffirmed and even made stronger the platform of 1888, upon which the party had suffered defeat. As the purpose of this article is merely to present as clearly as possible the attitude of the Democratic party on public questions, it would be out of place to enter upon the defense of the party's principles.

It may be said, however, in conclusion, that there is to-day and will continue to be an imperative need for a party thoroughly committed to the defense of the inalienable rights of the individual and to local self-government, and jealous of the encroachments of Federal power. Even when such a party is not in power, it exercises a potent influence in molding public opinion and in restraining excesses, because it is very quick to champion the cause of an individual whose rights have been trespassed upon, or the cause of a community whose rights have been ignored. In proportion as the organization is true to the principles promulgated by Jefferson and defended by Jackson, it may hope to appeal to the confidence of those who seek neither favoritism nor privileges, but are content to enjoy the blessings of a government in which each individual is protected in the enjoyment of life and liberty and in the pursuit of happiness.

WILLIAM JENNINGS BRYAN.

Democratic Societies in the United States, 1793. The masses in this country sympathized with the French Revolution, as essentially the

same with their own, and would have liked an open stand by the government on that side. Instead, the attempt of Edmond Genet (q.v.) to drag the country into an active alliance with France, forced Washington to proclaim neutrality. This irritated popular feeling, and made it worth while for local politicians to organize a faction on the basis of French sympathies, ignoring American questions wholly. It is curious that this basic element of the Democratic or "people's party," which charged the Federalists with being anti-national, monarchic, and a "British party," was itself the only purely foreign party ever known in the United States. In all the considerable towns, clubs were organized in imitation of the Jacobin clubs of France: indeed, that of Charleston openly claimed to be a branch of them, and was formally recognized as such. As usual in such cases, they mimicked ludicrously the outer semblance of their prototypes, without regard to American fitness: wore cockades and liberty caps, called each other "citizen" and "citizenship," held banquets of fraternity, etc. They were at first looked down upon by the "Republicans" or opponents of the Federalists on American questions, who accepted their votes but scorned their antics and irrelevancy; but common political opposition soon forced them into a common organism, which was called Democratic-Republican, still the official name of the party. Washington's denunciation of the societies in 1794, as having fostered the Whiskey Insurrection (q.v.), which in fact they approved, the atrocities of the Reign of Terror, and the final downfall of Robespierre and the Jacobin Club of Paris,—perhaps equally the fact that the craze had become a bore,—caused the general disappearance of the clubs or societies in 1794-5.

Democritus, Greek philosopher of the new Eleatic school: b. Abdera between 470 and 460 B.C.; d. 370 B.C. Some Magi and Chaldeans, whom Xerxes left on his return from his Grecian expedition, are said to have excited in Democritus the first inclination for philosophy. After the death of his father he traveled to Egypt, where he studied geometry, and probably visited other countries, to extend his knowledge of nature. Among the Greek philosophers he enjoyed the instruction of Leucippus. He afterward returned to his native city, where he was placed at the head of public affairs. Indignant at the follies of the Abderites, he resigned his office, and retired to solitude, to devote himself exclusively to philosophical studies.

In his system he developed still further the mechanical or atomical theory of his master Leucippus. Thus he explained the origin of the world by the eternal motion of an infinite number of invisible and indivisible bodies, atoms, which differ from one another in form, position, and arrangement, and are alternately separated and combined by their motions in infinite space. In this way the universe was formed, fortuitously, without the interposition of a First Cause. Although denying the presence of design in nature, he admitted that of law. He called the common notion of chance a cover of human ignorance, the refuge of those who are too idle to think. The eternal existence of atoms (of matter in general) he inferred from

DEMOGEOT — DEMON

the consideration that time could be conceived only as eternal and without beginning. In the atoms he distinguished figure, size, gravity, and impenetrability. Fire consists, according to him, of active globules, and spreads, like a light envelope, round the earth. The soul consists, in as far as it is a moving power, of the finest fire-atoms; but since it is acquainted with the other elements, and anything can be known only by its equal, it must be composed in part also from the other elements. The continuation of the soul after death was denied by Democritus, who divided it into two parts: into the rational part, which has its seat in the breast; and the sensual part, which is diffused through the whole body. Both constitute only one substance. He applied his atomical theory, also, to natural philosophy and astronomy. Even the gods he considered to have arisen from atoms, and to be perishable like the rest of things existing. In his ethical philosophy Democritus considered the acquisition of peace of mind as the highest aim of existence. The purest joy and the truest happiness are only the fruit of the higher mental activity exerted in the endeavor to understand the nature of things, of the peace of mind arising from good actions, and of a clear conscience.

Demogeot, Jacques Claude, zhāk klōd dē-mō-zhō, French historian and poet: b. Paris 5 July 1808; d. there 9 Jan. 1894. He wrote a 'Study of Pliny the Younger'; 'Letters and Men of Letters in the 19th Century'; 'French Literature in the 17th Century,' his greatest work. His poetical writings are a drama, 'Romeo and Juliet' (1852); 'New Paris,' consisting of epico-lyric descriptions; and 'Stories and Talks in Verse' (1860).

Demogor'gon, dē-mō-gōr'gōn, a mysterious divinity in pagan mythology, viewed as an object of terror rather than of worship. First mentioned by Lactantius (or Lutatius) Placidus in a commentary on Statius, about the 5th century A.D. By some regarded as the author of creation, and by others as a famous magician, to whose spell all the inhabitants of Hades were subjected. In Shelley's 'Prometheus Unbound' it is this dread power of the Demogorgon that overthrows Love.

Demography, or Demology (Gr. *demos*, the people, and *graphein* to write, describe), is the science of peoples or of population. This science deals with the ethnical affinities of nations, and the characteristics, physical and intellectual, that result therefrom. This descriptive portion of the science is however quite subsidiary to the economic and statistical object of demography. The increase and decrease of population, and the subsistence obtainable for the support of races, problems such as Malthus discussed, all belong to this science which is more than ever engaging the study of learned men. C. Engels has extended the meaning of the term far beyond the field of mere statistics and has made it to include the political and social idiosyncrasies of races. This opens a wide speculative area, which gives a new importance to the subject. The results of all demographical investigations are such, however, as can be stated in mathematical terms. See Kümelin, 'Zur Theorie der Statistik'; C. Engels, 'Darstellung seines demologischen Systems';

Guillard, 'Éléments de Statistique Humaine ou Démographie comparée.'

Demoiselle, dā-mwā-zēl', the Numidian crane (*Anthropoides virgo*), an African bird which visits the south of Europe. It is about three feet in length, and differs from the true cranes in having the head and neck quite feathered and the tertials of the wings elongated and hanging over the tail. It has its name from its gracefulness and symmetry of form.

Démoivre, dē-mwāvr, **Abraham**, French mathematician: b. Vitry 26 May 1667; d. London 27 Nov. 1754. He settled in London after the revocation of the Edict of Nantes, and gained a livelihood by becoming a teacher of mathematics. His chief works are: 'Miscellanea Analytica'; 'The Doctrine of Chances, or a Method of Calculating the Probabilities of Events at Play'; and a work on 'Annuities'; besides 'Papers' in the 'Transactions' of the Royal Society, of which he was a Fellow.

Demon (Greek, *daimon*), a name given by the ancients to a spirit or genius supposed to hold an intermediate place between men and the celestial deities. In Homer we find the term *daimon* sometimes applied to one or other of the gods; but it is commonly used by him in a general sense, as when we speak of "the Deity" or "Providence." Daimon is probably derived from *daiō*, to divide or distribute, though some look upon it as equivalent to *dæmon*, intelligent or wise. Hesiod uses *daimon* in a different sense from Homer. He admitted four classes of rational beings—gods, demons, heroes, and men. A strict classification was not made until the popular belief had been introduced into the schools of the philosophers. Aristotle divides the immortals into gods and demons: the mortals into heroes and men. In the Greek philosophy these demons early played an important part. Thales and Pythagoras, Socrates and Xenophon, Empedocles and the Stoics, invented many fictions concerning them, each in his own way. The poetic Plato, however, goes further than any of the others. In 'The Banquet Dialogue' the character of the demons is thus explained: "Demons are intermediate between God and mortals; their function is to interpret and convey to the gods what comes from men, and to men what comes from the gods; the prayers and offerings of the one, and the commands of the others. These demons are the source of all prophecy, and of the art of the priests, in relation to sacrifices, consecrations, conjurations; for God has no immediate intercourse with men, but all the intercourse and conversation between the gods and mortals is carried on by means of the demons, both in waking and in sleeping. There are many kinds of such demons or spirits." In other places he says of them, they are clothed with air, wander over heaven, hover over the stars, and abide on the earth; they behold unveiled the secrets of the time to come, and regulate events according to their pleasure; every mortal receives at birth a particular demon, who accompanies him until his end, and conducts his soul to the place of purification and punishment. Later writers divided them, in reference to the effects ascribed to them, into good and bad spirits—Agathodemons and Cacodemons. The Romans still further developed the Greek demonology; with

less, however, of a poetical character, and mixed with Etruscan notions.

A full and systematic development of demonism is found in Buddhism, which recognizes six classes of beings in the universe, two only of which, those of men and angels, are good; the other four—the Asuras, irrational animals, Pretas or goblins, and the denizens of hell—are evil. The Asuras are the most powerful of the wicked spirits, and are at constant war with the gods (Devas). They dwell beneath the three-pronged root of the world-mountain, occupying the nadir; while their great enemy, Indra, the highest Buddhist god, sits upon the pinnacle of the mountain in the zenith. With the Asuras are associated numerous groups, as the Rakshasas, gigantic opponents of the gods, terrible ogres with bloody tongues and long tusks eager to devour human beings, and lurking in fields and forests; the Nagas, snakes with human faces; the Mahoragas, great dragons; the Pisatshas or Vampires, etc. According to their nature and office, the different species of demons dwell in the air, the water, or the earth, in holes, dens, or clefts. See *Religion under Egypt*; and also HEBREWS; ZOROASTER.

In the New Testament we find demons, "devils," or "unclean spirits" occupying a prominent place, the Greek word used being generally *daimonion* (a neuter adjectival noun from *daimon*). These spirits are represented as entering into and "possessing" human beings, injuriously affecting them in some strange manner, and as being "cast out" by Christ and his disciples, and even by some among the Jews themselves (Luke ii. 19). Very different views are held regarding these accounts of demoniacal possession. Some regard them as plain statements of fact, believing that "nothing can be more plainly declared than that demons obtained possession of man's soul and body, so as to assert their mastery, and that by our Lord and his agents they were miraculously driven out." "There is every reason to suppose that as the world has become Christian, the powers of evil have been controlled and rendered unable to gain such possession of men as they did in Judæa, and neighboring places, in the time of our Lord and the apostles, and as they are said to do in some parts of the world now. It is believed, moreover, that when Christ was on earth, the Devil put forth his utmost power, knowing that his time was short, and that he was then suffered to put forth a stronger hand than before or since in order that the triumph of Christ might be more conspicuous." These sentences, from Blunt's 'Dictionary of Doctrinal and Historical Theology,' represent what may be called a highly orthodox view of the subject of possession. The same writer admits that "the symptoms of possession, as described in the Gospels, are those of some ordinary diseases, and we have one case which might be put down as confirmed epilepsy with suicidal mania." The Roman Catholic Church teaches that there can be no doubt of the actuality of demoniacal possession. See EXORCISM.

In the opinion of some writers the persons spoken of in the New Testament as possessed of devils were really sufferers from common diseases, being the unhappy victims of madness, monomania, hypochondria, hysteria, epilepsy, and kindred ailments; and that Christ in dealing

with them merely accommodated his language to the prevalent opinions of the time.

However much the first teachers of Christianity participated in the beliefs of their fellow-countrymen respecting the doctrine of spirits, there can be no doubt that their successors, the fathers and teachers of the Church, were considerably influenced by the popular ideas on this subject. In the early Church the "energumens" or persons possessed were recognized as a distinct class, and the Church originated a regular discipline in regard to them. The lives of the saints and holy men and women contain many a story in which demons figure, and the office of exorcist was long one of importance. It did not readily occur to the Jew or early Christian to deny even the existence of the gods of the heathen nations; they were simply regarded as demons or devils. We thus find in literature up till the Middle Ages, and even on this side of them, the divinities of Oriental, classical, and Scandinavian mythology figuring as princes of hell. See such works as Sir Walter Scott, 'Demonology and Witchcraft'; Conway, 'Demonology and Devil-lore'; and for the demons of Scripture the dictionaries of the Bible, as Smith, Hastings, and the 'Encyclopædia Biblica' (Vol. I. 1899); also Horst, 'Dämonomachie' (2 vols. 1818); and 'Zauberbibliothek' (6 vols. 1821-6); Ukert, 'Ueber Dämonen, Heroen, und Genien' (1850); Bastian, 'Der Mensch in der Geschichte' (3 vols. 1860); Taylor, 'Primitive Culture' (2 vols. 1871); Roskoff's admirably learned 'Geschichte des Teufels' (2 vols. 1869); also some of the older books, as Bodin, 'De Magorum Demonomania' (1581); and the like. See ANGEL; ANIMISM; DEVIL; EVIL; EXORCISM; HELL; SERPENT-WORSHIP; WEREWOLF; WITCHCRAFT; ZOROASTER.

Demonetization. See BIMETALLISM.

Demoniac, a person whose mental faculties are overpowered, and whose body is possessed and actuated by some created spiritual being; especially a person possessed of or controlled by evil spirits. On the other hand there are instances in the histories of every country which go to show that their greatest characters—prophets, seers, and geniuses—have been so called inspired demoniacs. The New Testament has many narratives of demoniacs, and various opinions are entertained in regard to the character of their affliction.

Demonstration, a proof in which the conclusion necessarily follows from the premises, and the rejection of the conclusion, therefore, always involves a contradiction. The great domain of demonstration is mathematics, in which all the proofs, however complicated, are drawn from a few simple axioms, founded on intuitive perception of number, time, and space. In ordinary language, however, demonstration is often used as synonymous with proof, and sometimes even more loosely as synonymous with explanation and exhibition, as when we speak of anatomical demonstration. In military tactics it is an operation, specifically, of almost any kind which may be performed to the end of deceiving the enemy in regard to the real measures to be taken against it.

De Morgan, Augustus, English mathematician: b. Madura, southern India, 27 June 1806; d. London 18 March 1871. In 1828 he was appointed professor of mathematics in University

DEMOSTHENES

College, or as it was then called, London University—a situation which he held until 1866, with the exception of the five years from 1831 to 1836. Previous to this appointment he had turned his mathematical attainments to account in the service of some of the London assurance companies, and continued throughout his life the confidential adviser of some of the most important of these associations. Among his many works are: 'Elements of Arithmetic' (1830); 'Elements of Algebra' (1835); 'Elements of Trigonometry' (1837); 'Essay on Probabilities and on Their Application to Life Contingencies and Insurance Offices' (1838); 'Formal Logic' (1847).

Demos'thenes, famous Greek orator: b. Athens 384 or 385 B.C.; d. 322 B.C. His father left him a considerable fortune, of which his guardians attempted to defraud him. Demosthenes, at the age of 17 years, conducted a suit against them himself, and gained his cause. He studied rhetoric under Isæus, and benefited in some degree from the teachings of Isocrates and Plato. But nature had placed great obstacles in his way, and his first attempts to speak in public were attended with derision. He not only had very weak lungs and a shrill voice, but was unable to pronounce the letter *r*. These natural defects he endeavored to remedy by the greatest exertions. He succeeded by the advice of the actor Satyrus, who advised him to recite with pebbles in his mouth, on the roughest and steepest places. To strengthen his voice he exercised himself in speaking aloud on the seashore, amidst the noise of the waves. At other times he shut himself up for months in a subterranean room, with his head half-shaved, that he might not be tempted to go out, and endeavored to acquire dignity of manner by practising before a mirror. He is also said to have transcribed the history of Thucydides eight times for the purpose of forming his style. After such a laborious preparation he composed and delivered his masterly speeches, of which his enemies said that they smelt of the lamp, but to which posterity has assigned the first rank among the models of eloquence—speeches in which he openly opposed the foolish wishes of the multitude, censured their faults, and inflamed their courage, their sense of honor, and their patriotism. He thundered against Philip of Macedonia in his orations known as the Philippics, and instilled into his fellow-citizens the hatred which animated his own bosom. The first Philippic was delivered in 352 B.C., when Philip could no longer conceal his ambitious scheme of subjugating the whole of Greece. In 349 the city of Olynthus, the northern ally of Athens, was captured and destroyed by the Macedonians, and shortly afterward Philip took possession of the Pass of Thermopylæ. The orator insisted on the necessity of immediately preparing a fleet and an army; urging the Athenians to begin the war themselves; to make Macedonia the theatre, and to terminate it only by an advantageous treaty or a decisive battle. They admired and approved his plans, but did not execute them. The celebrated Phocion, who knew the weakness of Athens, unceasingly advised peace. Demosthenes went twice to the court of Philip to negotiate, but without success. On his return he recommended war, and endeavored to arm not only Athens, but all Greece. When Philip had finally penetrated into Phocis, through the Pass

of Thermopylæ, and had taken possession of the city of Eletea (338), to the terror of Athens, Demosthenes obtained a decree of the people for fitting out a fleet of 200 vessels, marching an army to Eleusis, and sending ambassadors to all the cities of Greece, for the purpose of forming a universal confederacy against Philip. He was himself among the ambassadors, and prevailed on the Thebans to receive an Athenian army within their walls. He also exerted himself actively throughout Bœotia, and by his efforts a numerous army was collected to act against Philip. A battle was fought near Cheronea, and the Greeks were vanquished. Demosthenes fled, like thousands more. Nevertheless he was desirous of delivering a funeral oration over those who had fallen in battle. Æschines, his rival, did not fail to attack him on this account. The hostility between the two orators was the occasion of the speech 'De Corona' (on the crown), which resulted in the triumph of Demosthenes and the exile of his adversary. Philip having been soon after assassinated, Demosthenes endeavored to rouse Athens to regain her independence, but Alexander's dreadful chastisement of her ally Thebes filled the Athenians with such terror that they sued for mercy. It was with difficulty that Alexander could be persuaded to desist from his demand of the surrender of Demosthenes and some other orators; for the Macedonians feared Demosthenes more than they did the armies of Athens. He was afterward fined 50 talents on a charge of bribery, and being unable to pay the fine, was thrown into prison, from which he escaped and fled to Ægina, where he remained till the death of Alexander. Then followed the war with Antipater. Demosthenes again appeared in public, and endeavored to persuade the small Grecian states to unite against Macedonia. The Athenians received him with honor; but the war was unsuccessful, and Antipater insisted upon his being surrendered to him. Demosthenes fled to the Temple of Poseidon, in the island of Calauria, on the coast of Argolis, but finding himself not secure, he took poison, which he always carried about with him. He died, according to the general account, in 322 B.C., at the age of 60 or 62 years.

The character of Demosthenes is by most modern scholars considered almost spotless. Cicero pronounces him to be the most perfect of all orators. He always spoke as circumstances required, and was by turns calm, vehement, or elevated. He carried the Greek language to a degree of perfection which it never before had reached. In energy and power of persuasion, in penetration and power of reasoning, in the adaptation of the parts to the whole, in beauty and vigor of expression, in strong and melodious language, he surpassed all his predecessors. Everything in his speeches is natural, vigorous, concise, symmetrical. This alone can explain his great influence over his contemporaries. We have under his name 61 orations, 56 exordiums, and 6 letters, some of which are not genuine. Among the oldest editions of the orations the best is that of Paris, 1570, in folio, with the commentaries of Ulpian. The first edition of his complete works, Greek and Latin, was edited by Hieronymus Wolf (Basel 1549). The edition by Bekker (Leipsic 1855) is considered among the best of the modern ones. See Schäfer, 'Demosthenes und seine Zeit.'

Demot'ic, or **Enchorial, Alphabet**, from the Greek *demos*, the people, is the name given by antiquarians to that alphabet which is used by the people, in contradistinction to an alphabet used by a certain class or caste; as, for instance, among the Egyptians the 7th century before Christ. We find on the famous Rosetta stone three inscriptions, one in hieroglyphics, one in demotic characters, and one in Greek. According to Champollion the demotic is a simplification of the hieratic, which again was a contraction of the hieroglyphic characters. According to Wilkinson the oldest inscriptions in demotic writing only date from the era of the Ptolemies. The hieroglyphic writing was a mixture of figurative, symbolic, and phonetic characters; the demotic for the most part is made up of the latter. See **HIEROGLYPHIC WRITING**.

Demot'icos, or **Demotika**, Turkey in Europe, a town in the province of Rumelia, on the Maritza, 20 miles south from Adrianople. The town has some silk, woolen, and earthenware manufactures. It is the see of a Greek archbishop, and is defended by a citadel, containing a palace, in which several of the Turkish sultans resided before they gained possession of Constantinople. Charles XII. remained here for some time after the disaster of Pultowa. Pop. 8,000.

Demp'ster, **Charlotte Louisa Hawkins**, Scottish novelist: b. Forfarshire, Scotland, 1835. She has been a frequent contributor to English periodicals. Her first book was 'The Hôtel du Petit St. Jean: a Gascon Story' (1869); the second, 'Vera' (1872), established her reputation. Her other works include: 'Essays' (1872); 'Iseulte' (1875); 'Blue Roses' (1877); 'Within Sound of the Sea' (1878), a Scottish story; 'Ninette' (1888), an idyl of Provence.

Dempster, **Thomas**, Scottish scholar: b. Cliftbog, Aberdeenshire, Scotland, 23 Aug. 1579; d. near Bologna, Italy, 6 Sept. 1625. In France, whither he went at an early period of his life, he represented himself as a man of family (assuming the title of Baron of Muireisk), and possessed of a good estate, which he had abandoned for his religion, the Roman Catholic. He was promoted to a professor's chair at Paris, in the College of Beauvais, and in his latest years was a professor at Bologna. Bayle says that though his business was only to teach a school, he was as ready to draw his sword as his pen, and as quarrelsome as if he had been a duelist by profession; scarcely a day passed, he adds, in which he did not fight either with his sword or at fist-cuffs, so that he was the terror of all the schoolmasters.

Dempster's works are very numerous, and exhibit proofs of great erudition. Among them his 'Historia Ecclesiastica Gentis Scotorum' is the most remarkable, though, instead of being, as its title would indicate, an ecclesiastical history of Scotland, it is merely a list of Scottish authors and Scottish saints. His really most valuable work is 'De Etruria Regali,' an edition of which was published at Florence in 1725.

Demul'cents, remedies of a mucilaginous nature that are used in inflammatory conditions of the mucous membrane. They consist largely of mixtures of the oils, gums, and albumins. Thus sweet oil, acacia, tragacanth, marshmallow, slippery elm, white of egg, cream, milk, and

flaxseed are all types of this class of remedies.

Demur'rage, in maritime law, is used to signify the amount to be paid by the charterer to the owner of a ship for detaining her in port longer than the time specified. The time of delay in port for a cargo, for convoy, etc., is usually stipulated in the charter-party, and also the allowance to be made in case of longer delay for those objects; and this time is sometimes specified in working days or lay days, as distinguished from holy days, when no cargo can be put on board. All ordinary cases of detention, such as port regulations, the overcrowded state of the harbor, and the like, or even from the unlawful acts of the custom-house officers, are at the freighter's risk, and demurrage must be paid although it is proved that the delay was not caused by any fault of his. But demurrage cannot be claimed when the ship is detained by a public enemy or by the hostile occupation of the port, nor if the detention is caused by the owner, master, or crew. The claim ceases whenever the vessel is cleared and ready for sailing, though she should be detained by adverse winds or rough weather.

Demur'rer, a pause or stop put to the proceedings of an action upon a point of difficulty, which must be determined by the court before any further proceedings can be had therein. He that demurs in law confesses the facts to be true, as stated by the opposite party, but denies that, by the law arising upon those facts, any injury is done to the party, or that he has made out a lawful excuse.

A general demurrer is one not specifying an objection, but relies on some defect in substance; a special demurrer specifies some particular defect in the form of the adversary's allegation.

Demy, *de-mi'*, a certain size of paper. In America a sheet of writing paper of the size 16 x 21 inches. English writing demy is 15 x 20 inches, while the printing paper there known as demy is 17½ x 22 inches.

Den (Anglo-Saxon, *denu*, a valley or woody ground) whenever added to the name of a place, denotes it to be in a valley or near timbered land. Used a great deal in Scotland.

Denain, *dé-nân*, France, town in the department of Nord, six miles from Valenciennes, on the left bank of the Scheldt, which is here navigable. It stands in the centre of a coal-field, and both coal and iron are extensively mined, and supply several blast-furnaces and other iron-works. Denain had once a celebrated abbey, founded in 764. A great victory was gained here in 1712 by the French under Villars over the allies under Eugene and Albemarle. Pop. 18,511.

Dena'rius, a Roman silver coin, the principal one under the republic and the empire, originally of the value of 10 asses or pounds of copper; but afterward of 16 asses, when the weight of the as was reduced to one ounce in 217 B.C. It was first minted in 269 or 268 B.C. when it weighed 72 grains. It was equivalent to about 16 or 17 cents of United States money. The obverse bore the helmeted head of Roma and the mark of its value X—that is, 10 asses; the reverse had Castor and Pollux upon it. Later other mythological and historical types were cast upon it. It continued to be the or-

DENBIGH — DENGUE FEVER

inary silver currency down to the age of the Emperor Septimius Severus and his sons, by whom pieces composed of a base alloy were introduced. The name was also given to gold coin struck during the empire; its full title was *denarius aureus*, and it was generally called *aureus*, but by Pliny uniformly *denarius*. It passed for 25 silver *denarii*. Diocletian in 296 A.D. gave the name *denarius* to a coin of copper issued by him. Again, the *denarius* of Tiberius is the penny mentioned in the New Testament.

Denbigh, dĕn'bĭ, Wales. (1) A maritime county; area, 425,038 acres. Its surface, minerals, and productions are as in other parts of Wales. Pop. 129,935. (2) A municipal and parliamentary borough, capital of the county of Denbigh. Pop. 6,439.

Denby, Charles, American diplomatist: b. Mount Doy, Va., 1830; d. Evansville, Ind., 13 Jan. 1904. He was educated at Georgetown University and Virginia Military Institute and became a lawyer. Having served through the Civil War and attained the rank of colonel, he resumed the practice of law. He was appointed minister to China in 1885 and served for 13 years in Peking. In 1898 he was made a member of the commission to investigate the conduct of the war with Spain, and in 1899 a member of the Philippine Commission. During the war between China and Japan the Japanese government placed its interests in China in his care.

Denderah, dĕn'dĕr-ā, Egypt (the Tentyra of the Greeks and Romans), a village on the left bank of the Nile; lat. 26° 10' N.; lon. 32° 40' E.; celebrated for its temple, one of the most magnificent and best preserved remains of antiquity in Egypt, begun under Ptolemy XI. and completed in the reign of the Emperor Tiberius. It was dedicated to the goddess Athor or Aphrodite, and is enclosed within a wall built of sun-dried bricks, in some parts 35 feet high and 15 feet thick. The portico of the temple consists of 24 columns, in three rows four deep on either side, each above 22 feet in circumference, and 50 feet high. The interior consists of a number of apartments, all the walls and ceilings of which are covered with religious and astronomical representations, including the figure of Athor. The roofs are flat, and are formed of oblong masses of stone resting on the side walls, or on rows of columns carried down the middle of the building, and whose capitals are richly ornamented with the budding lotus. The only light admitted to the interior was by small perpendicular holes cut in the ceiling, or by oblique apertures in the sides. The hieroglyphics and ornamentation of the temple belong to the declining period of Egyptian art. The effect of the portico is greatly heightened by the fact of its roof being retained; and on the ceiling is the famous zodiac, at one time regarded as of great antiquity. Another remarkable object belonging to the temple, and which excited the greatest interest, was a celestial planisphere or zodiac, forming the ceiling of one of the upper chambers. This was carefully removed from its original place in 1822, and conveyed to Paris.

Dendermonde, dĕn-dĕr-mōn'dĕ, or **Termonde**, Belgium, town in the province of East Flanders, at the junction of the Dender and the Scheldt rivers, 12 miles northwest from

Brussels. It is strongly fortified, defended by a citadel, and surrounded by low, marshy ground which can be laid under water. It contains manufacturing of woollen and linen goods, tobacco, and other articles. It is an important railroad centre. It possesses a college, a public library, an academy of design and architecture, a music school, a number of paintings by Van Dyke and DeCraey, and a remarkably decorated ancient town-hall. Pop. 10,000.

Dendrerpeton, dĕn-drĕr'pĕ-tōn, a small lizard-like reptile, discovered by Dawson and Lyell in Nova Scotia; so named from its being found in the interior of a fossil trunk, and hence supposed to have been of arboreal habits. It is now regarded as a labyrinthodont, and is ranked by some scientists under the tribe *Microsauria*.

Den'drite (Gr. "tree-like"), any mineral in which arborescent forms resembling trees or mosses occur. These peculiar markings, which are often of great delicacy and beauty, are commonly due to the presence of certain metallic oxides which have separated from the general mass of the mineral. Moss agate is a familiar example of a dendrite, the markings in this case being due to the presence of oxide of manganese. The name "dendrite" is also applied to the complex, tree-like crystalline growths often observed in the case of silver, lead, copper, and certain other metals.

Dendrobium, an extensive genus of epiphytes belonging to the order *Orchidacea*, natives of India, where they are found in great numbers in the damp tropical forests. About 200 species are known, of which 80 are cultivated in hothouses. The genus varies greatly in the character of its bloom, some of the species being among the finest of the epiphytes. Among this class are *D. nobilis*, *D. chrysanthemum*, *D. gibsoni*, and *D. densiflorum*.

Dendrolagus, a genus of marsupial animals, popularly known as tree-kangaroos, from their habit of living in trees. Their fore legs are not much shorter than the hind ones. Four species are known, one of them (*D. lumholtzi*) being a native of northern Queensland, and the other three (*D. ursinus*, *inustus*, and *dorianus*) natives of the island of New Guinea.

Den'drophis, a genus of snakes, family *Dendrophidae*, with smooth scales, which are much larger along the back than on the sides; the sides of the abdomen are slightly keeled. This genus occurs in India, the East Indies, and Australia, and its members are not venomous.

Dengue (dĕn gā) **Fever** (also called dandy, breakbone, and three-days' fever, scarlatina rheumatica, abu rokab), a specific disease usually distinguished by an acute onset with fever, intense muscular and joint pains, and later by a measles-like eruption. In some countries it is endemic and has three times assumed pandemic proportions. It is found in Eastern countries — Arabia, China, India, Africa, especially in Egypt and Zanzibar. It has been found in Spain, Greece, and Asia Minor; in Bermuda, the West Indies, the southern United States; in parts of South America; and in Sydney and Brisbane, Australia. It is essentially a disease of the tropics, where it is usually found in hot weather, in the coast and river districts and low levels more than in inland parts; and it would

seem to be a communicable disease, depending upon some micro-organism. As a rule the disease lasts from four to eight days, and the prognosis is favorable. It is frequently confounded with influenza, yellow fever, rheumatism, measles, scarlet fever. Treatment is by means of quinine, ice, the newer antipyretics, and opium. Consult: 'Encyclopedia Medica' (Vol. II.); Manson, in Albutt's 'System of Medicine' (Vol. II.).

Denham, Dixon, English explorer: b. London 1786; d. Sierra Leone 9 June 1828. In 1823-4 he was engaged, in company with Capt. Clapperton and Dr. Oudney, in exploring the central regions of Africa. His courage, address, firmness, perseverance, and moderation, his bold, frank, energetic disposition, and his conciliating manners, peculiarly fitted him for such an undertaking. The account of the expedition was prepared by Denham, and published under the title 'Narrative of Travels and Discoveries in Northern and Central Africa' (1826). In 1826 he went to Sierra Leone as superintendent of the liberated Africans, and in 1828 was appointed lieutenant-governor of the colony.

Denham, Sir John, English poet: b. Dublin, Ireland, 1615; d. London March 1669. He was the son of Sir John Denham, chief baron of the exchequer in Ireland, and was educated in London and at Oxford. In 1641 he first became known by his tragedy of 'The Sophy.' This piece was so much admired that Waller observed, "Denham had broken out like the Irish rebellion, 60,000 strong, when no person suspected it." In 1643, he published the first edition of his most celebrated poem, called 'Cooper's Hill.' Among the last and best of his productions is a poem in which he commemorated the death of Cowley. His poetry generally is remarkable for its rhythmic flow and smoothness, leading up sometimes to passages of force and dignity.

Den'hart, or Denhardt, Clemens and Gustave, German explorers: b. Zeitz 1852 and 1856, respectively. They made a tour in 1878, through the Tana River region, East Africa, to establish German trade, and another from the Island of Lamu to Vitu in March 1885, the sultan of the Swahili desiring a treaty with Germany. Clemens Denhart transferred part of the territory acquired by him to the German Colonist Society, the Deutsche Witugesellschaft. All rights to this territory were ceded by Germany to England in 1890, in exchange for the island of Helgoland, the brothers receiving an indemnity of 150,000 marks from the German government.

Denina, Carlo Giovanni Maria, kār'lō jō-vān'nē mā-rē'ā dā-nē'nā, Italian historian: b. Revello, Piedmont, 28 Feb. 1731; d. Paris 5 Dec. 1813. He studied at Turin, in 1758 became an extraordinary professor in the university there, and in 1770 full professor. In 1769 he published the first three volumes of his 'History of the Italian Revolutions,' his most important work. He went to Berlin in 1782, and was appointed a member of the Academy. He published 'La Prusse littéraire sous Frédéric II.'; 'Political and Literary History of Greece'; and 'Letters from Brandenburg'; etc. His 'Clef des Langues,' dedicated to Napoleon, brought him the position of librarian to the emperor.

Deni'o, Hiram, American jurist: b. Rome, N. Y., 21 May 1799; d. Utica 5 Nov. 1834. He studied law, was admitted to the bar, and practised at Rome and Utica. He was appointed circuit judge of the Fifth New York circuit, and was three times elected judge of the State court of appeals, the first time in 1853. He retired from that office in 1866. He edited with William Tracy 'Revised Statutes' of New York (1852), and published 'Reports of Cases Argued and Determined in the Supreme Court and in the Court for the Correction of Errors' (5 vols. 1845-8).

Denis, Fr. dé-nē, or Denys, Saint, or Dionysius, Saint, first bishop of Paris, and patron saint of the French nation. Exact information regarding Saint Denis cannot be obtained, but there is no doubt he belongs to the 3d century. In the Middle Ages it was believed by many that Saint Denis, or Dionysius, of Paris was the same as the Dionysius converted at Athens by Saint Paul; but the number of years intervening between the time of Saint Paul and when Saint Denis was bishop of Paris (about 207 years) is proof that the Areopagite of Athens and the apostle of Paris were not the same person.

The most reliable authorities say that Saint Denis of Paris was sent by the Pope to Gaul about 250 A.D. His mission was most successful and many pagans were converted to Christianity. The number of his disciples attracted the attention of the Roman governor who caused the arrest of Denis and several of his companions, among whom were Eleutherius, a deacon, and Rusticus, a priest. The Christians, refusing to denounce Christ and offer sacrifice to the gods, were tortured and put to death. The bodies of Denis, the priest, and the deacon were thrown into the Seine. Catulla, a Christian woman, recovered the bodies and gave them burial. Later a church was built over the place where the bodies were interred. Dagobert I. built (about 636) here the Abbey of Saint Denis. His feast, in the calendar of the Roman Catholic Church, is 9 October. Consult: Butler, 'Lives of Saints'; Tailliar, 'Apostolate of Saint Denis'; Vereilly, 'Vie de Saint Denis.'

Denis, St., sǎn dé-nē, France, town in the department of the Seine, six miles north of Paris, lying within the lines of forts surrounding the capital. It has numerous manufactories of calicoes and other printed cotton goods, gelatine, candles, saltpetre, and soda. In the latter part of the 3d century a chapel was erected on or near the present site to the memory of St. Dionysius or Denis, who is said to have been martyred here. For this chapel Dagobert I., in the 7th century, substituted a large basilica, in which he himself was interred, and afterward it was used as the burial place of the kings of France. Changes were made later but under the Abbot Suger the building became most beautiful. The chapel was destroyed during the Revolution and the bodies of the kings put into a cannon pit. Many of the tombs and relics were, however, preserved in the Musée des Petits Augustins. Napoleon's decree of 20 February 1806 made St. Denis again the burial place of the reigning family of France. Louis XVIII. obliterated from St. Denis all traces of Napoleon's rule; but under Napoleon III. the famous architect Viollet-le-Duc effected a mag-

nificent restoration of the ancient building. The present stained-glass windows are all modern but one. Pop. 53,653.

Denison, Charles Wheeler, American poet and prose writer: b. New London, Conn., 11 Nov. 1809; d. 14 Nov. 1881. He published: 'The American Village and Other Poems' (1845); 'Out at Sea,' poems (1867); 'The Child Hunters' (1867); and a series of biographies: 'The Tanner Boy' (Grant); 'Winfield the Lawyer's Son' (Hancock); etc.

Denison, Frederic, American clergyman: b. Stonington, Conn., 28 Sept. 1819; d. Providence, R. I., 16 Aug. 1901. He was graduated from Brown in 1847; was chaplain in the Union army during the Civil War, and held several pastorates. He has written: 'The Supper Institution'; 'The Sabbath Institution'; 'Notes of the Baptists and Their Principles in Norwich, Conn.'; 'Westerly and Its Witnesses'; 'History of the First Rhode Island Cavalry'; 'Picturesque Rhode Island.'

Denison, George Taylor, Canadian soldier: b. Toronto 31 Aug. 1839. He was educated at Upper Canada College and Toronto University, was called to the bar in 1861, and practised law in Toronto, in 1877 being appointed police magistrate of the city. In 1872 and 1873 he was sent to England as commissioner in behalf of immigration. He began his military service in 1855 and was made lieutenant-colonel in 1866; he was in active service in the Fenian raid of 1866 and in the Riel rebellion in the Northwest Territory in 1885. His 'History of Cavalry' (1877) won the first prize offered by the emperor of Russia for the best book on the subject; he has written also: 'The National Defenses' (1861); 'Canada, Is She Prepared for War?' (1861); 'The Fenian Raid at Fort Erie' (1866); and 'Canada and Her Relations to the Empire' (1895). He was one of the founders of the "Canada First" party, and through his contributions to periodical literature and public addresses has been known as an earnest advocate of Canada's rights and of the preservation of the unity of the empire.

Denison, John Evelyn, English politician, for 14 years speaker of the British House of Commons: b. Ossington, Nottinghamshire, 27 Jan. 1800; d. 7 March 1873. Educated at Eton and Christ Church, Oxford, he entered Parliament in 1823, and was a lord of the Admiralty 1827-8. In 1872 he retired from the speaker's chair, and shortly after was created Viscount Ossington. He was a D.C.L. of Oxford; and it was on his suggestion that the "Speaker's Commentary" to the Bible was undertaken.

Denison, John Henry, American Congregational clergyman: b. Boston, Mass., 3 March 1841. He was college pastor at Williamstown for five years, and is the author of 'Christ's Idea of the Supernatural' (1895).

Denison, John Ledyard, American writer: b. Stonington, Conn., 19 Sept. 1826. He has published: 'Pictorial History of the Wars of the United States' (1859); 'Illustrated History of the New World' (1872); 'Pictorial History of the Navy of the United States' (1860).

Denison, Mary Andrews, American author: b. Cambridge, Mass., 26 May 1826. She married Charles Wheeler Denison (q.v.) in 1846 and became connected with the 'Olive Branch'

of which he was on the editorial staff. Contributing frequently to the American and later to the English magazines, she wrote sketches of native life while living in British Guiana, where her husband was American consul. Among her numerous works are: 'Home Pictures' (1853); 'Gracie Amber' (1857); 'Old Hepsy, a Tale of the South' (1858); 'Opposite the Jail' (1858); 'The Lover's Trials' (1865); 'Annie and Teely' (1869); 'That Husband of Mine' (1874), which sold more than 200,000 copies in a short time; 'That Wife of Mine' (1877); 'Rothmell' (1879); 'Mr. Peter Crewelt' (1878); 'His Triumph' (1883); 'What One Boy Can Do' (1885). She has also written many Sunday-school books.

Denison, Iowa, city, county-seat of Crawford County; on the Boyer River, and on the Chicago & N., and the Illinois C. R.R.'s; about 100 miles west by north of Des Moines. Flouring mills and creameries are the chief manufactures. It is the site of one of the Denison Normal and Business schools, a private institution. Pop. (1900) 2,771.

Denison, Texas, city in Grayson County, on the Missouri, K. & T., the Houston & T. C., and the Texas & P. R.R.'s; 106 miles north of Dallas. It is a noted cattle-shipping place; the trade centre of the surrounding agricultural country, including the Indian Territory; and an important railroad point. It has manufactories of cotton, iron, and machinery, daily and weekly papers, high school, electric lights, waterworks, two national banks, St. Francis Xavier's Academy, and the Washington School. It was settled in 1872 and is now governed under a charter of 1893. Pop. (1902) 12,986.

Denison University, an educational institution in Granville, Ohio; founded in 1831, under the auspices of the Baptist Church, and intended at first as a manual training school. The manual training was soon abandoned, and the theological department was dropped in 1870. The Shepardson College for Women, established in 1887, became affiliated with the university in 1900. In 1902 the library contained about 22,000 volumes, and the attendance was 500.

Denitrification. See NITRIFICATION.

Denizen, in English law, an alien who by letters patent has been constituted a British subject permanently or for a time. A denizen is in a middle state between an alien and a natural born or naturalized subject. He may take lands by purchase, or derive a title by descent through his parents or any ancestor, though they be aliens. No denizen can sit in Parliament, or take office, civil or military.—In natural history, an animal or plant originally introduced into a country or district by human agency, which now maintains itself there without the direct aid of man, is called a denizen of that country or district.

Denman, Thomas, BARON, English jurist: b. London 23 Feb. 1779; d. 22 Sept. 1851. He was associated with Brougham in the courageous defense of Queen Caroline (1820), and shared his consequent popularity. He sat in Parliament in 1818-26, and was attorney-general in Earl Grey's administration in 1830-2; succeeded Lord Tenterden as lord chief justice of England in 1832; and was raised to the peerage in 1834. He retired from the bench in 1850.

DENMARK

Denmark (Danish, *Danmark*), a northern kingdom of Europe, between lat. 54° 40' and 57° 45' N., and lon. 8° 4' and 12° 45' E. It is composed of a peninsular portion, and an extensive archipelago, lying east of it, with a few scattered islands on its west side; and is bounded north by the Skager Rack, which separates it from Norway; northeast and east by the Cattegat and Sound, which separate it from Sweden; east and south by the Baltic; south by the duchy of Sleswick; and west by the German Ocean or North Sea. The peninsular portion is composed of Jutland, and measures, north to south, 185 miles with a breadth varying from 40 to 108 miles—its broadest part being from Fornæs Point, lat. 56° 26' 42" N., on the east coast, to Nissum Fiord on the west coast. The numerous islands lying east of Jutland are mainly comprised in two groups:—first, that of Sjælland, Seeland or Zealand, including, besides the large island of that name, the small adjoining islands east of the Great Belt, the principal of which are Amager, Langøe, Tarøe, Masnedøe, Agersøe, Lolland or Laaland, Falster, and Møen, and second, the Fünen or Fyen group, comprising, besides the large island of that name, the neighboring islands west of the Great Belt, including Langeland, Aerøe, Fanøe, Taasinge, and others. Besides these, there are the outlying islands of Lessøe and Anholt, in the Cattegat, and Bornholm in the Baltic.

Besides these territories, Denmark possesses the Färøe Islands and Iceland, in the North Atlantic Ocean; Greenland, in the Arctic regions; the islands of Santa Cruz or Saint Croix, Saint Thomas, and Saint John, in the West Indies. She also formerly had some establishments on the coasts of Guinea, in Africa, and of Coromandel, in India; but these have been sold to Great Britain.

For administrative purposes Denmark is divided into 18 counties (*Amter*), each county being subdivided into *Herreder* or hundreds. Copenhagen is the capital, and among the towns of importance are Aarhus, Odensee, and Aalborg.

The following table gives the main divisions of the country, with their area and population, as well as the total area and population of the whole monarchy, according to the census of 1 Feb. 1901:

DIVISIONS	Area Eng- lish sq. m.	Population 1901
City of Copenhagen (Kjöbenhavn) without suburbs.....	21	378,235
Islands in the Baltic.....	5,062	1,007,513
Peninsula of Jutland.....	9,765	1,063,792
Färøe Islands (17 inhabited)...	512	15,230
Total.....	15,360	2,464,770

Previous to 1864 the duchies of Schleswig-Holstein and Lauenburg belonged to Denmark, so that the area of the kingdom was then greater by about 7,360 square miles, the corresponding population being more than a million.

Geology and General Aspect.—Denmark is a very low-lying country, there being no elevation of any consequence throughout the whole kingdom. The greatest height is attained on the eastern side of the peninsula, though even there it never exceeds 550 feet. In respect of geological structure all the rocks belong to the upper series of the Secondary, and to the Tertiary

formation, and have been deposited from water in regular strata. The rock most fully developed is the chalk, of which several distinct species have been recognized. The whole west coast is rendered almost uninhabitable by the drift-sand, which has formed an almost uninterrupted line of sterile downs, called *Klitten*, extending from Cape Skagen to Blaavands Hook, a distance of nearly 200 miles. Along parts of the coast of Jutland are extensive flats or plains, which have been wrested from the sea, and which are protected from its encroachments by huge dykes, as in Holland.

Rivers, Lakes, Sea-arms, Ports, etc.—Denmark has no large rivers; the principal is the Guden, which is navigable for part of its course. Less important streams are the Holm, the Lönborg, and the Stor Aa. All the others are insignificant streams. There are no rivers in any of the islands, but brooks and streamlets abound. There are a number of lakes, particularly in Jutland, and several in the larger islands; but they are all small. The most remarkable of the physical features of Denmark are its lagoons or fiords, winding inlets of the sea, that penetrate far into the land. The largest of these is the Lymfiord, or Liim Fiord, in Jutland, which, entering the land in the Cattegat, winds its way quite through the peninsula, and is separated from the North Sea merely by a narrow strip of land which storms have ruptured in one or two places. Most of the streams, lakes, and coasts of the kingdom are well stocked with fish. Besides these inland seas, the Great Belt separates the large islands of Seeland and Fünen, and the Little Belt flows between the latter and the coast of Jutland and Schleswig. Denmark is well supplied with excellent seaports, the most important being Copenhagen, Aalborg, Aarhus, and Randers.

Climate.—The prevailing characteristic of the climate of Denmark is humidity; it is also remarkably temperate for so northerly a region; both the result of the lowness of the land and of its proximity to the sea on all sides. The heats of summer are great, sometimes excessive. The mean temperature of the year is 47°. The shortest day is about 6½ hours, the longest 17½ hours.

Animal and Vegetable Products.—Horses and cattle are reared in great numbers, and both are excellent. Large flocks of sheep are kept; but rather for the flesh than the wool, which is coarse and short. Swine are also reared to a great extent. Deer, stags, roes, hares, and a variety of other game are met with in the royal and other forests, but do not abound anywhere else. Wild fowl—including the eider-duck, so famous for its down—are numerous. Poultry of all kinds are raised, particularly geese. Potatoes, barley, oats, rye, beans, pease, tares, flax, hemp, madder, and tobacco are raised; wheat in Laaland and buckwheat in Fünen. Among the garden fruits are apples, plums, cherries, pears, and nuts. Few of the great forests with which the country was once covered now remain. Government, however, has of late years paid some attention to this source of national wealth, and has taken measures for the protection and better management of the forests. The larger forests are now confined to the east side of Jutland and to Seeland.

Agriculture, Cattle Breeding, etc.—Although not particularly favored by nature, Denmark is

DENMARK

yet pre-eminently an agricultural country. Of the total area 80 per cent is productive; about one sixth of the unproductive area is bog. The land is greatly subdivided, as the law interdicts the union of small farms into larger, and encourages the division of landed property. The kinds of grain most largely cultivated are barley, oats, rye, and wheat, the greatest area being occupied by oats, the second by barley. Rye is grown throughout the whole peninsula, and in the islands of Fünen and Seeland, and some of the islands on the west coast. From this grain the greater part of the bread used in Denmark is made. Wheat, which occupies but a comparatively small area, is grown chiefly on the islands of Laaland and Langeland, and on large estates in other quarters of the kingdom. The yearly yield of the cereal crop is said to be larger than that raised by any corresponding European population except that of Mecklenburg. The oats crop of 1898 amounted to 39,920,052, the barley crop to 21,048,564, that of rye to 15,328,240, and that of wheat to 2,878,120 bushels. The value of these crops was estimated at \$48,856,830, the total value for all crops for that year being \$91,091,910. Buckwheat is cultivated to some extent in Jutland, as also in the island of Fünen and elsewhere. Potatoes, which were introduced into Denmark early in the 19th century, are now very generally cultivated. Herbage plants and grass are carefully cultivated. Beans, pease, and tares are also extensively cultivated throughout the whole country and form an important article of food. Flax, hemp, hops, tobacco, madder, lavender, and mustard-seed are grown, but not in sufficient quantities to supply the home demand. The part of the kingdom best adapted for the production of fruit is the island of Fünen. Cattle-breeding, grazing, and the dairy engage the greatest share of the farmer's attention in Denmark. Large and increasing numbers of cattle are annually exported from the country. A great increase has of late years taken place also in dairy produce, and the export of butter is now the main source of the wealth of Denmark. The rearing of horses is extensively carried on. The old Danish breed is found chiefly in Jutland. Those from the islands are said to be of Tartar descent, and are small, but strong and active. Sheep-rearing is on the decline in Denmark. Eggs are now largely exported, and the rearing of hogs is much attended to; the greatest number are reared in the vicinity of the woods in East Jutland. The rearing of bees occupies a large share of attention, particularly in the island of Fünen, and wax is largely exported.

Fisheries.—The fisheries are an important branch of national industry. Next to the herring the turbot, torsk, and salmon are the most abundant sorts of fish. Oyster banks occur on the east coast of Jutland, near its northern extremity, and near the island of Lessøe. Fish-ponds were at one time very general over the country, and were profitable. The seal fisheries of Denmark are considerable, the principal station being the island of Anholt.

Manufactures.—These are comparatively insignificant, and do not comprise any peculiar or national manufacture. There are, however, one or two articles which have attained a considerable reputation; these are the woollens and earthenware of Jutland, the former a domestic manufacture; the wooden clocks of Bornholm, and a superior kind of stove made in Copenhagen.

The manufacture of paper is pretty extensive, and has of late years been greatly improved and extended. There are also iron-foundries, sugar-refineries, some extensive tanneries, and many distilleries. Randers in Jutland, and Odensee in the island of Fünen, were formerly celebrated for the manufacture of gloves; but the peculiar kind of leather from which they were made, and in which their excellence consisted, is now prepared in other countries. The people of Denmark bake their own bread, brew their own beer, and spin the greatest portion of the woolen yarn afterward knitted into stockings or woven into cloth by the village weaver. The women make up their own dresses, and frequently the clothes of their husbands; the latter make the wooden shoes and slippers, and manufacture the greater part of the house furniture and farming utensils. Several of the manufacturing establishments of Denmark belong to the government. Among these establishments are a royal porcelain manufactory in Copenhagen, and a royal cloth manufactory in Irsserød, which supplies cloth for the army.

Commerce, Canals and Railways.—The commerce of Denmark is carried on chiefly with Great Britain, Germany (especially Sleswick-Holstein), Norway, Sweden, and Russia, Great Britain and Germany possessing by far the largest share. The chief imports are textile goods (especially cottons), metals and hardware, wood and articles made of it, coal, bricks, salt, manure, oil, oil-cake, fish, rice, coffee, fruit, glass-ware, paper. The principal imports are cotton manufactures, coal, and iron. Considerable quantities of cottons are imported by Denmark from Germany. The manufactures of Denmark being, as already mentioned, insignificant, the articles exported consist chiefly of agricultural products. The declared value of the total imports in 1876 amounted to \$63,583,790, and that of the exports to \$50,185,285; in 1898 they were \$126,386,115 and \$89,602,770 respectively. In 1898 the mercantile marine of Denmark consisted of 3,696 vessels, with a total tonnage of 356,108 tons. The coasting trade is extensive, and is largely shared in by foreigners. There are several canals in Denmark, but none of them of any great consequence. The country is now pretty well supplied with railroads, there being lines running across the islands of Seeland, Fünen, Laaland, and Falster, which, assisted by ferries, gives direct communication with the capital on the one hand and with Jutland on the other.

Monies, Weights, etc.—Since 1 Jan. 1875, the unit of the Danish monetary system has been the *krona* or crown, equal to about 28 cents. The krona is divided into 100 *öre*. The commercial pound weight is heavier than the United States weight of that denomination, 100 pounds Danish being equal to 110¼ pounds avoirdupois. The weight of 100 pounds Danish is known as the *centner*. The principal measure used throughout Denmark for corn is the barrel or *toende*, which contains 7,776 Danish cubic inches or 8,488 English cubic inches, and consequently is equal to nearly four bushels. The *viertel*, used for wine and liquor, is equal to 1.7 gallon. The standard measure of length is the foot, which equals 12.356 inches. The Danish mile is 4,684 English miles. 16 Danish square feet are nearly equal to 17 English square feet. A tonne or *toende* of land is as much land as can be

DENMARK.

Population of places is indicated by different lettering, thus:

100,000 and over COPENHAGEN
50,000 to 100,000 Odense
15,000 to 50,000 Randers
1,000 to 15,000 Smaller Places
Railroads

DENMARK

sown with one toende of rye, one of barley, or two of oats, and is equal to 1.36 acres.

People, Education, Religion.—The population of Denmark is composed almost exclusively of Danes, with a few thousand Jews and others. The Danes have regular and well-formed features, fair or brownish hair, and blue eyes, with muscular frames; they are kind-hearted, honest, and simple-minded, and continue to maintain their ancient reputation of being bold and hardy seamen. All classes are noted for their hospitality, which is indeed a characteristic of the nation. At the head of the educational institutions stand the University of Copenhagen and the Holberg Academy at Sorøe. Elementary education is widely diffused, although in this regard Denmark is no longer so pre-eminent as formerly; it is compulsory for children between the ages of 7 and 14 years, poor parents paying only a nominal sum toward the government or parochial schools, of which there are about 3,000. There are training colleges for teachers, and classical and other higher education is afforded by a large number of colleges in the more important towns, with the university of Copenhagen (1,300 students) for the centre of the entire system. Denmark has also a theological seminary, a royal surgical college, a veterinary and agricultural school, and numerous military, technical and commercial schools, while 50 "people's high schools" provide instruction in agricultural subjects. There are three public libraries in Copenhagen, of which the Royal Library, with 500,000 volumes, is especially rich in Oriental and Icelandic MSS. The established religion is Lutheran, to which the king must belong; but complete toleration is enjoyed in every part of the kingdom. The Reformation was introduced in 1536, when the Church revenues were seized by the crown. Denmark is divided into seven dioceses, in which there are 1,360 parishes. There are only 31,000 persons not belonging to the Lutheran Church, of whom 4,000 are Jews, 3,600 Roman Catholics, 2,300 Methodists, 1,000 Mormons, 4,600 Baptists, and 2,600 Irvingites.

Government, Army and Navy, Finance.—The government of Denmark is a constitutional monarchy, the king being assisted by a cabinet of seven ministers. The crown was elective until 1660, when the people and clergy, impelled by hatred toward the nobles, invested the sovereign (Frederick III.) with absolute power, and declared the succession to the throne hereditary. From that time the crown exercised absolute rule till 1831, when a constitution was granted. This proving unsatisfactory, was superseded in 1848 by the form of government which, with some alterations, Denmark now enjoys. The national assembly or Rigsdag consists of the Folkething and Landstthing, which meet annually, the members receiving a fixed allowance during their sittings. The Landstthing is composed of 66 members, of whom 12 are nominated for life by the king, while the remainder are elected for a term of eight years by certain bodies representing the large taxpayers of the kingdom. The members of the Folkething, whose number is fixed by statute in the proportion of one to every 16,000 of the population, are elected for three years by practically universal suffrage. To this body all budgets must first be submitted; but in the years 1877-87, when the government had a minority in the lower house, the king was in-

duced to give the royal ratification to successive "provisionary budgets," which had never received the assent of the Rigsdag. Nevertheless the financial condition of Denmark is sound and prosperous. The total revenue in the period 1885-95 fluctuated from \$15,000,000 to \$16,000,000 a year; while the expenditure has repeatedly exceeded \$18,000,000. Since the war of 1866, the government has maintained a comparatively large reserve fund to meet any sudden emergency. That fund stood in 1887 at \$4,950,000. The total national debt is over \$50,000,000, or about \$25 per head of the population; but as the investments of the state (in telegraphs, etc.) amount to nearly \$25,000,000, this proportion is reduced to less than \$15. The decimal system was introduced in 1875, the unit being the *kroner*, or crown, of 100 *øre*; the average rate of exchange is 3.6 *kroner* to the dollar. The Danish army numbers 1,200 officers and 46,000 men, inclusive of the landwehr; but only a sufficient establishment for garrison purposes is maintained, and the peace strength is 750 officers and 13,000 men. The total war strength is about 50,000 men, to which an extra reserve of 14,000 could be added on emergency. Conscription prevails, and the period of military service is divided into eight years in the line and reserve, and eight in the extra reserve. The navy is recruited by levies from the coast districts. The fleet comprises some 40 steamers (of which 10 are ironclads, but only one a first-class battleship). The navy numbered in 1888, 134 officers and 1,477 men. There were in 1897, 290 officers and 1,150 men. Besides Copenhagen (q.v.), there are no defensible fortresses, though there are antiquated forts at Helsingör (Elsinore) and Fredericia. The arsenal is at Copenhagen.

History.—The early history of Denmark is lost in the twilight of the saga-period, out of which loom dimly the figures of its heroes, their brave deeds, and daring voyages. Within its borders the Celts had first their home, and from its shores the Angles and Saxons sailed in the 5th century to the conquest of England; while in their place the Danes from Zealand settled on the deserted lands, extending their sway as far south as the Eider. One of their earliest kings, Harald Hildetand, fell in battle against the Swedes in 695; and shortly afterward a branch of the Ynglinger occupied Jutland, where they held a footing for two centuries. One of their kings, Harald Klak, received baptism in 826 from Ansgar, but the introduction of Christianity did not at once place any check on the long accustomed inroads on Frankish territory, or on the piratical expeditions of the Vikings; although the country was soon torn by dissensions between the adherents of the old and new faiths. Gorm the Old, who drove the Ynglinger from the peninsula, and first united the mainland and islands under one rule, was the bitter enemy of Christianity; and although his death in 936 gave fresh vigor to the diffusion of the new faith, yet even its ultimate success was only insured by the zealous support it received from Gorm's grandson, Canute. On his death in 1035 the three kingdoms of his Anglo-Scandinavian empire separated, and his sister's son, Svend Estridsen (1047-76), ascended the throne of Denmark, founding a princely line that flourished 400 years. Internal dissensions and external wars weakened the country, and the introduction of a feudal system raised up a powerful nobility,

DENMARK

and ground down the once free people to a condition of serfdom. Waldemar I. (1157-82) added Rügen to the other Wendish districts of Mecklenburg and Pomerania, and extended his sway over Norway also. Under Waldemar II. the conquests of Denmark extended so far into German and Wendish lands, that the Baltic was little more than an inland Danish sea. The jealousy of the German princes and the treachery of his vassals combined to rob him, however, of these brilliant conquests, and his death in 1241 was followed by a century of anarchy and inglorious decadence of the authority of the crown, during which the kingdom was brought to the brink of annihilation. Under his great-grandson, Waldemar IV., Denmark made a transient recovery of the conquests of the older Waldemars, rousing the jealousy of the Hanseatic League, and the national laws were codified. From his death in 1375 to 1412, his daughter, the great Margaret, widow of Hakon VI. of Norway, ruled not only that country and Denmark, but in course of time Sweden also, with so light yet firm a hand that for once in the course of their history the three rival Scandinavian kingdoms were content to act in harmony. Margaret's successor, Eric, the son of her niece, for whose sake she had striven to give permanence, by the act known as the Union of Calmar (1397), to the amalgamation of the three sovereignties into one, undid her glorious work with fatal rapidity, lost the allegiance and the crowns of his triple kingdom, and ended his disastrous existence in misery and obscurity. After the short reign of his nephew, Christopher of Bavaria (1440-8), the Danes exerted their ancient right of election to the throne, and chose for their king Christian of Oldenburg, a descendant of the old royal family through his maternal ancestress, Rikissa, the great-granddaughter of Waldemar II. Christian I. (1448-81), who was at the same time elected Duke of Sleswick and Holstein, was the founder of the Oldenburg line, which continued unbroken till the death of Frederick VII. in 1863. His reign was followed by half a century of international struggles in Scandinavia. The insane tyranny of Christian II. cost that monarch his throne and freedom; the Danes chose his uncle Frederick I. to be their king, while Sweden was forever separated from Denmark, and rose under the Vāsas to be a powerful state. (See GUSTAVUS I.).

Under Christian III. (1536-59), the Reformation was established in Denmark. Christian IV. after his brief share in the Thirty Years' War, proved one of the ablest of all the Danish rulers. His liberal and wise policy was, however, cramped in every direction by the arrogant nobles, to whose treasonable supineness Denmark owes the reverse by which she lost (1658) all the possessions she had hitherto retained in Sweden; and with the relinquishment of these, and consequently of the undivided control of the passage of the Sound, the country's former international importance came finally to an end. The national disgraces and abasement which followed led, in 1660, under Christian's son, Frederick III., to the rising of the people against the nobles, and their surrender into the hands of the king of the supreme power. For the next hundred years, chiefly marked by wars with Sweden, the peasantry were kept in serfdom, and the middle classes depressed; but by the end of the 18th century the peasants had been gradually eman-

cipated, while many improvements had been effected in the mode of administering the laws, and the Danish kings, although autocrats, exercised a mild rule. The miseries of the reign of Frederick VI., who governed as regent from 1784, brought the country to the verge of ruin. Denmark having joined Russia in a compact of the northern powers hostile to England, a fleet was sent into the Baltic, and considerable injuries were inflicted by an attack on Copenhagen, in 1801, under Parker and Nelson. From this the country rallied; but in 1807 the British government, suspicious of an intention on the regent's part to violate his neutrality and take sides with Napoleon, demanded the surrender of the entire Danish navy, to be restored at the conclusion of peace. A refusal was followed by the bombardment of Copenhagen in September, 1807, and the fleet was given up; but this treatment drove Denmark into Napoleon's arms, and with him the kingdom was obliged to co-operate until the close of 1813.

By the congress of Vienna, Denmark was compelled to cede Norway to Sweden. From this period a spirit of discontent grew up in the duchies, degenerating into mutual animosity between the Danish and German population, which led to an open rupture with Denmark in 1848, immediately after the accession of Frederick VII. (For the whole question, see SLESWICK-HOLSTEIN. After alternate hostilities and armistices, the war was virtually concluded in 1850, by the victory of the Danes at Idsted; but in 1863 the quarrel was renewed. On the death of Frederick in that year, Prince Christian of Sleswick-Holstein-Glücksborg ascended the throne under the title of Christian IX., in conformity with the act known as the Treaty of London of 1852, by which the succession to the Danish crown had been settled on him and his descendants by his wife, Princess Louise of Hesse-Cassel, niece of King Christian VIII. of Denmark. A pretender, backed by German influence and help, at once started up in the person of the eldest son of the Duke of Augustenborg, who assumed the title of Duke Frederick VIII. of Sleswick-Holstein; but his cause was speedily merged and lost sight of by Prussia and Austria in their direct aim of incorporating the duchies with the German Confederation. Denmark, unaided by England and France, allies on whose support she had relied, was forced to go single-handed into the unequal contest. After a brave but utterly futile attempt at resistance, the Danes found themselves forced to submit to the terms dictated by their powerful foes, and resign not only Lauenburg and Holstein, but the ancient crown-appanage of Sleswick. By the peace of Vienna, 1864, the Danish king bound himself to abide by the decision which Prussia and Austria should adopt in regard to the destiny of the severed Danish provinces. The dissensions between these two great powers, which led to the Austro-Prussian war of 1866, resulted in the triumph of Prussia, and since then the duchies have remained an integral part of that state. Since the war, Denmark, although reduced to the narrow limits of the islands and Jutland, has recovered from its fall, and has greatly prospered, in spite of the spread of socialistic opinions, and the political dissensions that have ranged the government and Landsting, supported by the press of the capital, against the Folkething and majority of the people.

DENMARK

In 1870 war broke out between Germany and France and an alliance was formed between France and Denmark, with a view to the protection of the latter from German aggression. The result of the war was the downfall of the French empire; this treaty was dissolved, and Denmark felt that her safety lay in a strict neutrality. Yet the resentment of the country towards Germany was by no means allayed, and the general population were indignant that so many leading politicians were anxious to draw closer the lines that bound Germany and Denmark together. This indignation frequently broke out into such violent manifestations that at last it became evident that anything like a close alliance and understanding between the two states seemed impossible.

The 5th article of the treaty made between Austria and Prussia (23 Aug. 1866) had given to Denmark some prospect of recovering the northern districts of Holstein. There arose, however, considerable discussion with Prussia about the realization of this hope, and Prussia seemed reluctant to give any guarantee for the restoration of the territory. So long as the Emperor Napoleon was in power, this article, which he had not only suggested, but had maintained and advocated, the hope of Denmark for the surrender of North Sleswig appeared reasonable. After the catastrophe of Sedan (1870) this hope was forever abandoned. The French republic took no interest in Sleswig, Italy was equally indifferent, England was occupied in other matters and had learned in the Crimea to shun all meddling with other people's quarrels. The rage of the Danes was roused in 1879 on learning that Germany was discussing with Austria the abolition of Article 5 in the treaty, and even the Danish Court, by the marriage of the Princess Thyra, in 1878, with the Duke of Cumberland, whose dislike for the Germans was well known, had shared, by anticipation, in this expression of feeling. This national sentiment of the Danes took almost a warlike character. In the Rigsdag, 1873, legislative measures were proposed for the reorganization of the land and sea forces and the fortification of Copenhagen. The ruling party in the Folkethings strongly advocated an increase in the army and navy, and an improvement in the coast fortifications; this was advisable as a demonstration of power which would be of effect in the case of war between other nations, but would also secure Denmark against the encroachments of Germany. The representatives of rural constituencies or Agrarians, however, together with the Radicals, were opposed to an active policy on the part of Denmark. The Conservatives, with the sympathy of King Christian, were for warlike preparations, by the increased national defences.

In 1874 the Liberal party, under Fonnesbech, succeeded Holstein-Holsteinborg's Conservative cabinet, which had been in power since 1870, but even the Liberals failed to overcome the opposition which the Folkething persisted in showing to the proposed expenditure on the military and naval forces. The king therefore called into office a ministry of a purely bureaucratic character, which

he had counseled Estrup to appoint. Jacob Brønnum Estrup is a remarkable man. Since he took his seat in the Landsting in 1864, when he appeared as leader of the Agrarians, he has shown both power and patriotism in his political career, and has done much for the advancement of Danish constitutionalism. His desire has been to render Denmark's place among the Powers secure and independent, to develop its resources, and especially to secure for his country adequate protection in the carrying trade of the world's commerce. The King had found in him a man ready to carry out his wise designs for the little realm. In 1866 he had been a leading spirit in the revision of the constitutional code of Denmark, and he strongly advocated the view of the Conservatives that the Folkething, or lower house of the Rigsdag, had not, like the English House of Commons, the sole right to make appropriations from the public treasury. The Radicals of the Folkething, however, claimed supremacy in all matters of taxation and finance, and formed the Left in that assembly. On the other hand, the King and Landsting, or upper house, according to the Conservatives, had constitutionally the right of overruling the Folkething. Estrup was on the side of those who would not trust the lower house with the sole control of the exchequer. The government, he maintained, was threefold,—King, Landsting, and Folkething; where any two of them were united against the third, the majority ought to be paramount in deciding the issue. From the time Estrup was appointed Minister of Finance and President of the Council, the clash of parties increased day by day; Estrup again and again brought forth his measures of warlike preparation; again and again were they defeated. In the Folkething the opposition majority increased with every division. In 1876 this party had 74 members as against 27 supporters of the government. It threw out the Budget of Estrup, and the government was compelled to beat a retreat, although the fortification of Copenhagen went forward. This brought about a crisis in political affairs and also led to a new development in the constitution. Estrup stood his ground and was supported by the press as well as by the public opinion of the capital. He maintained that, according to the parliamentary system of Denmark, he had it in his power to propose a provisional finance measure; that such a measure could be carried by the Landsting, the upper house, which controlled the Folkething. The measure was carried with the approval of the King, and the fortifications at Copenhagen were on their way to be completed. In 1880 two measures were passed for the increase of the army and navy. The opposition thereupon began what was known as the "Verdorringspolitik," "The policy of blight," i. e., obstruction. Not only did they oppose the finance measures of the government, but every measure, of whatever kind, proposed by Estrup's party and sanctioned by the Landsting, they threw out. But the King and the ministry remained firm, and were supported by a large majority of the population of the country.

DENMARK

The fortification of Copenhagen was completed with the assistance of volunteer contributions to the amount of \$253,333.33. The financial prosperity of the country was evident. The appropriation made for land defences amounted to \$10,033,333.33; the department of railways had expended \$17,733,333.33. There was still a large balance in the treasury. The history of Denmark from that time is a history of parliamentary struggle. The Moderates of the Left could not keep pace with the violence of the Radicals, and in 1891 an actual rupture took place. The Moderates desisted altogether from the "policy of blight," or obstruction, and drew nearer and nearer to the Conservatives. The consequence was that the Radicals lost their supremacy in the Rigsdag, and in the elections of April, 1892, forfeited many seats. The opening speech of the prime minister in the Folkething (1892) outlined a policy which was not long in being carried out. The Moderate Lefts supported a measure for land defences; the fortifications projected were quickly finished, and the triumph of the Conservative was complete. This was shortly before the resignation of Estrup in 1894. But the fluctuations of parliamentary life in Denmark was not yet complete. The dispute indeed seemed interminable. The Landsting and the ministry stood on one side, a majority of the Folkething on the other. This majority in the lower house gradually completed the rupture which had been threatened during the debates on land defences, and seemed at last rent asunder permanently into Radicals and Moderates. In August, 1899, M. Hörring became premier. The Radicals had been gathering strength since the retirement of Estrup, and the absence of his firm hand and clear judgment had imperilled the tranquillity of the political voyage in Denmark. In 1900, however, the new Conservatives rallied their strength, and a cabinet was formed by one of their number, M. Sehøsted, who, after a stormy experience, resigned in 1902, when the Radicals won an overwhelming victory at the polls and a Radical administration, under Prof. Deuntzer, came into power. After the elections of September, 1902, the Landsting contained 29 Conservatives, 22 Independent Conservatives, 25 Radicals, and 1 Socialist. The ranks of the Independent Conservatives are largely recruited from the Radicals.

The prosperity of Denmark has greatly advanced since its dismemberment in 1864, and the increase in its trade has been remarkable. In 1898, the merchant steam fleet had an addition of 50,000 tons, in the shape of forty-nine individual ships. These form a part of the great tramp fleet that plies between Europe and America. The trade between Denmark and the United States has especially shown a healthy growth, the imports from the United States to Denmark for 1901 being over \$21,000,000, while the United States imported from that country goods to the value of more than \$2,000,000. This growth of trade between the two countries has been rapid, for the route from Copenhagen to Newport News and Norfolk,

Va., was only opened up in 1898. The six Danish steamers engaged on this route also run to New Orleans and carry American goods to all the principal Baltic ports. The New York route has two large steamers newly built in 1898. The Danes emigrate in considerable numbers to the United States and generally settle in the agricultural districts of the west, notably in Illinois. Recent census returns give the annual Danish immigration as about 4,000. Agriculture has been developed in the peninsula to a remarkable degree during the past few years, and dairy produce manufactured with the aid of steam machinery has shown a proportionate increase. There are about 900 steam dairies in Denmark. The sanitary precautions taken by government in the inspection of cattle are more thorough than anywhere else in the world.

The Danish West Indian possessions have recently been looked upon as likely to become territories of the United States. These comprise St. Croix, the largest of the Virgin Islands; St. Thomas, a smaller island further south, and St. John, to the east of St. Thomas. Their united area is 118 square miles. The proximity of these islands to Porto Rico naturally points to their ultimate annexation and their importance as stations in the trade routes of the Caribbean Sea adds to their desirability as United States possessions. There has been for many years a willingness expressed by Denmark to transfer these islands, and the question was brought up afresh in 1902, when a treaty, providing for the sale of the Danish West Indies to the United States for \$5,000,000, was signed at Washington by President Roosevelt, 14 January, and ratified by the Senate, 17 February. This was considered to have settled the question finally, but 23 April of the same year the Danish Landsting passed a resolution postponing a decision as to the sale, until the electors qualified to send members to the Colonial Council should be consulted. The sale was not to be ratified until these electors should approve the cession. The Folkething went even further than this, and refused to ratify the sale, unless the inhabitants of the islands, who are mostly free negroes engaged in the cultivation of the sugar cane and number 35,156, declared in favor of the transfer by a plebiscite. The matter was thus naturally referred once more to the Landsting, and when the matter came before that body (22 October) their decision was regarded as adverse to the bill. As the Premier reminded the Council, it would be necessary to put out more capital in the islands unless they were sold, and accordingly the West Indian Co., with a capital of \$1,000,000, was formed at Copenhagen three days after the decision of the Landsting. The object of this company is to promote Danish trade with the Danish West Indies. Trade between Denmark and these three islands had been steadily decreasing for some years, and the Danish government in 1902 appointed a commission to proceed to the islands and report on measures for improving their commercial condition.

DENMARK

Danish Language and Literature.—The Danish language has sprung from the southeastern or Danish-Swedish branch of the *dönsk tunga* (or *lingua danica*), which was the common name by which the language of all the Scandinavians was designated in the Middle Ages by the southern races of the Teutonic stock. From the 11th to the 13th century the Danish-Swedish branch of the Old Scandinavian became more and more markedly distinct from the Norwegian-Icelandic branch, through its replacing the old diphthongs with single long vowels, and dropping the initial *h* before *l*, *n*, and *r*; while the latter became characterized by a further modification of the *a* sound, by the loss of *v* before *r*, and by a series of contractions of consonants. In the provincial laws of the 12th and 13th centuries, which (after the Runic monuments) are the earliest specimens of this Danish-Swedish language, there are three dialects—that of Skaane (the southmost province of Sweden) and those of Zealand and Jutland, the first of which is nearest the old language, while the last two have deviated from it by dropping the final consonants from the old inflexional endings and changing their vowels *a*, *i*, *u* to a less distinct *e* or *ø*, retaining, however, the hard mutes *p*, *k*, *t* after vowels, as on the whole is still the case in Swedish and spoken Norwegian. The dialect of Zealand in the 14th and 15th centuries forms the foundation of modern Danish. The original vowels in almost all endings are there replaced by half-vowels and the dental aspirate *þ* by *t* or *d*; *p*, *k*, *t*, when following long vowels, are changed to *b*, *g*, *d*; masculine and feminine are merged in one common gender; nouns have no other case-ending than the possessive *s* for both numbers; verbs cease to indicate person (except in the imperative); and the singular number begins to supersede the plural, as it does everywhere in the spoken language from the 16th century. Danish, like Swedish, retains the suffixed definite article, which is characteristic of the Scandinavian languages. Its form is *-et* in the neuter, *-en* in the common gender, and *-ne* in the plural of both.

The influence of the Hanseatic League and the Oldenburg dynasty (from 1448) brought in a great number of Low-German words, especially relating to navigation and trade; while that of the order of St. Bridget contributed a considerable Swedish element. In the first half of the 16th century the Danish language was chiefly used by religious writers, and the translation of the Bible (1550) is the first important monument of modern Danish. After this period Latin became once more the language of learning and culture, and for a century and a half there was no Danish writer of eminence. The influence of French was predominant in the 17th century, and that of High-German, which had been constant since the Reformation, culminated in the 18th century under the Struensee administration, when it was the language of government and public instruction. The result is, that Danish is indebted to German for fully one third of its vocabulary. It was not till Holberg that the Danish written language began to be enriched from the stores of native expression in the spoken tongue. From the end of the 18th century revived study of Old Scandinavian and the development of a national poetic literature unfolded the language in a hitherto unsuspected richness and fulness, and since that time Danish prose has to a considerable extent worked itself out of

its poverty and dependence. Danish is the softest of the Scandinavian languages, though less euphonious than Swedish. It is the language of the educated class in Norway, where it is considerably augmented from the native dialect, and is spoken with a somewhat harder pronunciation. The best histories of the language are by Petersen (2 vols. Copenhagen, 1829-30) and Molbech (*ib.* 1846); grammars by Rask 2d ed. Lond. (1846), Lökke, Munch, Lyngby, Jessen, and Möbius (Kiel, 1871); and dictionaries by the Danish Academy (Copenhagen, 1793-1881), and Molbech (2d ed. 2 vols. *ib.* 1859), who also produced a 'Dansk-Dialekt-Lexikon' (*ib.* 1841) and a 'Dansk Glossarium' (*ib.* 1853-66) for antiquated words. Ferrall, Repp, and Rosing's 'Danish and English Dictionary,' in 2 parts (4th ed. Copenhagen, 1873), is the best for English students.

Literature.—After the Danish dialect had gradually separated itself from the Old Scandinavian as a softer and simpler speech, with a strong infusion of German ingredients, it was little used in writing down to the time of the Reformation. Saxo Grammaticus (that is, "the learned") in the second half of the 12th century wrote in Latin his 'Historia Danica,' the only literary production of mediæval Denmark that retains any interest. The earliest writings in Danish are the church laws of Skaane (1162) and Zealand (1170), and the civil laws of Skaane (1160), Zealand (1170), and Jutland (1241); and after these a number of chronicles, partly in verse, of which the best known is the 'Rimkrønike,' which was the first Danish book printed (in 1495). It is essentially an abridgment of Saxon. The famous Danish ballads called *Kæmpeviser* ("hero-songs"), some of which are said to belong to the latter part of the 11th century, were handed down orally from generation to generation, and were first collected, to the number of 100, by A. S. Vedel in 1591. In 1695 Peder Syv published a new edition with 100 more, and in 1812-14 appeared a selection of 222, edited by Abrahamson, Nyerup, and Rahbek. The most complete collection is in Svend Grundtvig's unfinished 'Gamle Folkeviser' (5 vols. 1853-77). They are about 500 in number, and treat of the adventures of heroes, love, enchantment, spectres, and historical events. Doubtless they were sung to the dance, as is still the case in the Färöe Islands. They must have suffered much by their not being written down till the 16th and 17th centuries.

The Reformation only emancipated Danish culture from Latin to bind it fast to German, which at the death of Frederick I. in 1533 was the language of the upper classes. About that time Christian Pedersen set up a printing-press at Malmö, at which he published a great number of popular books, and finally in 1550 the first complete translation of the Bible. Pedersen (1480-1554) is justly called the father of Danish literature. The hymns and translations of the Psalms by his contemporary Tausen (1494-1561), as also by Kingo (1634-1703), Vormondsen (1491-1551), and Arrebo (1587-1637), and the national history (10 vols. Copenhagen, 1595-1604) of Hvitfeld (1549-1609) were well received; but the Danish language was still banished from higher society till the advent of the Norwegian Holberg (1684-1754), the founder of Danish comedy. He found Denmark on the point of being absorbed in Germany. "The common peo-

DENMARK

ple," he says, "had no histories but dry lists of dates; no poetry but congratulatory verses; no theology but homilies and funeral sermons; and for plays, nothing but old stories about Adam and Eve." He wrote histories of Denmark, of the Jews, and of the Church; and the irresistible humor of his comedies and satires covered with ridicule the imitations of foreign speech and manners. What Holberg did for Danish prose, another Norwegian, Tullin (1728-65), did for Danish poetry. Equally dissatisfied with the current imitations of the 17th century court poetry of France, and with the poetic reform of Klopstock (at Copenhagen from 1751), Tullin followed the guidance of the English poets Pope, Young, and Thomson, and in this was followed by most of his countrymen who were settled at Copenhagen, while the Danes clung to German models. Ewald (1743-81), an ardent disciple of Klopstock, was Denmark's first great lyric poet and tragic dramatist. His verse shows an unsurpassed mastery of form, and is expressed in pure, clear, and noble language. Wessel (1742-85), by his "tragedy," 'Love without Stockings' (1772), a humorous parody of the Danish imitations of the classical French drama, succeeded in laughing them off the stage. Nordahl Brun (1745-1816), preacher and poet, Claus Frimann (1746-1829), "The Burns of the Norwegians," Claus Fasting (1746-91), Jonas Rein (1760-1821), Jens Zetlitz (1761-1821), and others, formed themselves (1772) into a "Norwegian Society" at Copenhagen, under the leadership of Wessel. It was the literary manifestation of the Norwegian aspiration to separate nationality, which afterward led to the foundation of the university of Christiania in 1811. From the death of Wessel in 1785 to the beginning of the present century the literature became entangled in rationalistic and political polemics, and produced little that is noteworthy. Its chief writers were P. A. Heiberg (1758-1841) and Malte Konrad Brun (1775-1826), both of whom were driven into exile in 1799-1800, the latter afterward famous as a geographer; the critic Rahbek (1760-1830); the dramatists Samsø (1759-96) and Sander (1756-1819); and the lyricist Thaarup (1749-1821).

The poet and humorist Baggesen (1764-1826) forms the link between the 18th century and the early part of the 19th, when Danish literature took an entirely new departure, partly owing to the study of Kant, Fichte, and Schelling, and the influence of Schelling's follower Steffens (1773-1845); partly also to the strict censorship of the press in force from the year 1799. The educated classes turned from their controversies on points of literary criticism and theology to scientific inquiry; and the people, whose national feeling had been aroused by the French Revolution, by the share of Denmark in the Napoleonic wars, and especially by the events of 1801 and 1807, the war with Sweden (1808), and the loss of Norway (1814), welcomed with enthusiasm the rise of a new school, led by the romantic poet Oehlenschläger (1779-1850), who was equally distinguished as a lyrical and dramatic writer, and is still regarded by many as the greatest Danish poet. Contemporary with him were the poets Schack-Staffeldt (1769-1826) and Grundtvig (1783-1872), afterward more eminent as a theologian; Ingemann (1789-1862), long the most popular novelist of Denmark; J. L. Heiberg (1791-1860), director of the royal theatre at

Copenhagen, writer of numerous vaudevilles, and of the still popular national play 'Elves' Hill' (1828); Hauch (1791-1872), dramatist, novelist, and critic; and Blicher (1782-1848), who in his tales of Jutland was the first worker in the field which has since been cultivated in Germany by Jeremias Gotthelf and Berthold Auerbach. Of the other novelists of this period the chief are Brosböll (b. 1820); Fru Gyllembourg-Ehrensvärd (1773-1856), mother of J. L. Heiberg; Saint-Aubain, or 'Karl Bernhard' (1798-1865); and the still more popular Winther (1796-1876), the charming poet of Danish country life Herz (1798-1870), from the time when his 'Ghost Letters' (1830) surprised the public with a poetic revival of the muse of Baggesen, has, now with his lyric poems, now with his tales, now in romantic and national tragedies, now in comedies and light vaudevilles, provided his countrymen with artistic and attractive works. Overskou (1798-1874) is a skilful dramatist, and Hostrup (1818-92) a popular author of comedies. All these writers are surpassed by Hans Christian Andersen (1805-75), whose wonderful stories are known throughout the civilized world. Less popular, but more profound, was the versatile writer Fr. Paludan-Müller (1809-76), who from his play 'Love at Court' (1832) to his great epic poem 'Adam Homo' (1841-48) has wooed all the muses in succession. Here may be mentioned Bergsøe (b. 1835), writer of novels and popular works on scientific subjects; Goldschmidt (1819-87), editor of the influential Democratic journals, 'The Corsair,' 'North and South,' and 'Home and Abroad,' and afterward author of numerous romances; Holst (1811-93), a writer of pleasing lyrics and tales; Kaalund (1818-85), with his two collections of poems 'A Spring' and 'An Autumn'; the erotic and piquant and sometimes frivolous song-writer Aarestrup (1800-56); and Lembeke (b. 1815), the translator of Shakespeare.

A great impulse was given to all branches of science from the beginning of the 19th century. The leading theologians were Grundtvig, the enthusiastic champion of the faith of his fathers against rationalism, and advocate of a union of the Scandinavian kingdoms, but with the Church separated from the state; Mynster (1775-1850), Bishop of Zealand; Clausen (1793-1877), the disciple of Schleiermacher, and theological opponent of Grundtvig; Martensen (1808-84), Bishop of Zealand, and author of standard works on systematic theology and ethics; and Kierkegaard (1813-55), the most original thinker of Denmark. The chief exponents of philosophy were Sibbern (1785-1872), Nielsen (b. 1809), and Bröchner (1820-76); and in natural science the greatest names were those of Oersted (1777-1851), the discoverer of electro-magnetism, the botanist Schouw (1789-1852), the geologist and chemist Forchhammer (1794-1864), and the zoologist and archæologist Steenstrup (b. 1813). Much has been done for the study of Scandinavian antiquity by the 'Sagabibliothek' of Müller (1776-1834), and the researches of Finn Magnusson (1791-1846) in mythology, and of Thomsen (1785-1865) and Worsaae (1821-85) in archæology. The chief 19th-century writers of national history have been Werlauff (1781-1871), Molbech (1783-1857), Allen (1811-77), Schiern (b. 1816), and K. P. Paludan-Müller (1805-82); and of the history of the national literature and language, Petersen (1781-1862). In philology,

Rask (1787-1831) and Madvig (1804-86) have a European fame.

About 1850 the enthusiasm for the national past, which had been excited by Oehlenschläger in Denmark, and by Tegné, Geijer, and others in Sweden, together with the hatred of Germany aroused by the war of 1848-50, rose to a pitch of fanaticism. "The northern force which had controlled the world" was extolled by Ploug and others as "the only means whereby the victory of the Cause of Humanity could be achieved." After Ploug (b. 1813) the chief exponents of this great historic mission of the northern kingdoms were C. K. F. Molbech (1821-88) a euphonious lyricist and skilful dramatist, and translator of Dante; and Erik Bögh (b. 1822), a fertile writer of *feuilletons* and adapter of plays. A cosmopolitan reaction set in about 1870, led by Georg Brandes (b. 1842), who proved in his lectures on literature that Denmark was only a side-chapel in the temple of European thought and art, and that this overstrained "Scandinavianism" was but the northern phase of the reaction from the tendencies of the 18th century, which had been experienced in England, France and Germany many years before. Brandes withdrew to Berlin for some years from the storm of popular opposition. Not only in Denmark, but in Norway and Sweden also, his followers are now the prevailing party. The most conspicuous of these have been Jacobsen (1847-85), the translator and adherent of Darwin, and author of 'Mogens' (1872) and other novels; and (till in 1883 he became a Conservative) Drachmann (b. 1846). Of recent writers, the most noteworthy are Schandorph (b. 1836), who is equally happy in his sketches of the Zealand peasant and the Copenhagen snob; the versatile writer Hermann Bang (b. 1858); and the dramatist Edvard Brandes (b. 1847), brother of Georg Brandes.

Of the three Scandinavian nations, the Danes have shown the greatest aptitude for the imitative arts, and their art is comparatively the most independent. While the painters of Norway have been mostly trained at Düsseldorf, and those of Sweden at Paris, the artists of Denmark have been especially attracted to Rome. The sculptor Thorwaldsen (q.v.) has left a great monument of his genius in the works contained in the Thorwaldsen Museum at Copenhagen. Of later artists may be mentioned the painters Marstrand, Carl Bloch, Exner, Kroyers, Henningsen, and Otto Bache. Of music, the chief composers in the 19th century have been Hartmann, Gade, and Heise.

Consult: Nyerup and Rahbek, 'Den danske Digtekunsts Historie', 4 vols. (1800-8), and 'Udsigt over den danske Digtekunst under Frederik V. og Christian VII.' (1819-28); Nyerup and J. E. Kraft, 'Almindeligt Litteraturrexikon for Danmark, Norge og Island' (Copenhagen, 1818-20); Peterson, 'Den danske Litteraturs Historie', 6 vols. (1853-64); Overskou, 'Den danske Skueplads i dens Historie' (1859-74); G. Brandes, 'Ludwig Holberg og hans Tid' (1884); the general treatises in Danish by Thortsen (1814; 6th ed. 1866), Heiberg (1831), Molbech (1839), Strom (1871), Erikson (Christiania, 1878), Winkel-Horn (1880), and Hansen (1884 et seq.); and in German by Strodtmann (1873), Wollheim de Fonseca (1874-77), and Winkel-Horn (1880); Gosse 'Studies in the Literature of Northern Europe' (1879); Ander-

son, 'History of the Scandinavian North' and 'Norse Mythology'.

Denne-Baron, Pierre Jacques René, pē-ār zhāk rê-nā dān bā-rôn, French poet and essayist: b. Paris 6 Sept. 1780; d. there 5 June 1854. He had much learning and a faultless taste; 'Hero and Leander' (1806); and 'Poetic Flowers' (1825) being delightful though not great, while his 'Dictionary of Conversation' is widely known.

Den'ner, Balthazar, German portrait painter: b. Altona 15 Nov. 1685; d. Rostock 14 April 1749. He was painter to several courts, executing portraits of princes and dignitaries, and was noted for his extraordinary minuteness of finish. Among his works are: 'Head of an Old Woman'; for which Charles VI. paid 4,700 florins; and 'Head of an Old Man,' both in the Vienna Museum; and many canvases in other famous galleries.

Dennery, Adolphe Phillipe. See ENNERY, ADOLPHE PHILLIPE DE.

Dennewitz, dēn'nē-vīts, Germany, village in the province of Brandenburg, Prussia, famous for the battle between the French and Prussians, 6 Sept. 1813, the former commanded by Ney (under whom were Oudinot, Bertrand, Reynier, and Arrighi), the latter by Tauenzien and Bülow. Forty thousand Prussians maintained their ground for several hours against 80,000 French; and on the arrival of the Russian and Swedish battalions victory declared in favor of the allies, who, after the Russians and Swedes came up, were far superior in numbers. The French were defeated, and fled in disorder.

Dennie, Joseph, American journalist: b. Boston 30 Aug. 1768; d. Philadelphia 7 Jan. 1812. He published 'The Farrago' (1795), essays on life and literature. From 1796 to 1798 he edited with great success the 'Farmer's Weekly Museum' at Walpole, N. H. In this appeared his essays signed 'The Lay Preacher,' whose droll and easy style made him popular. In Philadelphia (1801), assisted by Asbury Dickens, he founded the 'Portfolio,' which he edited till his death under the pen-name of 'Oliver Old-School.' Two collections of his writings have been published: 'The Lay Preacher, or Short Sermons for Idle Readers' (1796); and 'The Lay Preacher' (1817).

Dennis, John, English dramatist and critic: b. London 1657; d. 6 Jan. 1734. In 1697 he produced a comedy entitled 'Plot and No Plot,' which was followed by several dramatic pieces and poems of little value. He also became a political writer for the Whig party. The irritability of his disposition, heightened probably by the unprosperous state of his finances, involved him in perpetual broils, and made him a sort of standing jest with the wits of his time. He wrote some severe strictures on Addison's 'Cato' and Pope's 'Rape of the Lock.' Pope in return gave him a place in the 'Dunciad,' and in conjunction with Swift produced a sarcastic tract entitled 'A Narrative of the Deplorable Frenzy of Mr. John Dennis.' In his old age his necessities were relieved by a benefit at the Haymarket Theatre, to which his former antagonist, Pope, contributed a prologue.

Dennis, Robert, English journalist: b. Bodmin, Cornwall, 5 Jan. 1855. He was educated at Leipsic, was for a time reporter and

DENNISON — DENSITY

assistant editor on the *Mail* and *Glasgow News*, and then, removing to London, served on the staff of various London papers, and has been news editor of the London *Daily Express* from its foundation. He has published: 'Industrial Ireland' (1887); 'History of the Baronetage' (1887); 'The New Politics' (1898); 'A Romance of Tottenham' (1899).

Dennison, William, American statesman: b. Cincinnati, Ohio, 23 Nov. 1815; d. Columbus, Ohio, 15 June 1882. He was graduated at Miami in 1835 and became a lawyer, being elected to the Ohio legislature in 1848. He became governor of Ohio in 1860, and rendered invaluable aid to the Union cause throughout the Civil War. President Lincoln appointed him postmaster-general in 1864, an office he retained under President Johnson, resigning in 1866. Dennison College owes much to his liberality.

Denon, Dominique Vivant, dō-mē-něk vē-vān dē-nōn, BARON DE, French artist, diplomatist, and author: b. Châlons-sur-Saône 4 Feb. 1747; d. Paris 27 April 1825. He was attached to embassies at St. Petersburg, Switzerland, and Naples, successively. Becoming acquainted with Bonaparte, he accompanied the general in his campaigns to Italy and Egypt, and Desaix to Upper Egypt. The work which was the result of this journey, 'Voyage dans la Basse et la Haute Egypte,' was issued in 1802. When he returned to Paris with Bonaparte he was appointed inspector-general of the museums and all the works of art executed in honor of the French successes — monuments, coins, the erection of the triumphal pillar in the Place de Vendôme, etc. He accompanied Napoleon in all his campaigns, and employed himself in drawing and in selecting those masterpieces in the conquered countries, which were taken to Paris as trophies. After the abdication of the emperor he retained his office, but was deprived of it in 1815, in consequence of having joined Napoleon on his return from Elba. He retained, however, his place in the Institute. From that time he lived retired, and the preparation of engravings and lithographs of his splendid collection of works of art formed the occupation of his last years. In 1826 appeared at Paris the 'Description des Objets d'Art Composant le Cabinet de feu M. le Bar. V. Denon.'

Dens, Petrus, author of a manual of Catholic theology: b. Boom, Belgium 1690; d. Mechlin 15 Feb. 1775. He is noteworthy only as author of a manual text-book of Catholic theology, 'Theologia Moralis et Dogmatica' (Moral and Dogmatic Theology). This work, which, it seems, was used as a text-book in the ecclesiastical college of Maynooth in Ireland, happening to come under notice of some zealous opponents of the Roman Catholic Church, was translated (in whole or in certain parts) and published at Dublin in 1832 in the interest of anti-popery. The so-called incriminating passages in the work do not differ essentially from corresponding portions of other treatises on the same subjects used in Catholic schools of theology. The author of the treatise was a professor in the diocesan seminary of Mechlin and during 40 years was president of the institution. He was also honored with several offices of importance in the diocese of Mechlin — Canon Penitentiary, synodical examiner, archpriest of the

Metropolitan Cathedral of Belgium, and other offices.

Densim'eter, an instrument invented by Colonel Mallet of the French army, and M. Bianchi, for ascertaining the specific gravity of gunpowder. It consists of a glass globe having a tube which communicates with a quantity of mercury in an open vessel. The globe is joined at top to a graduated glass tube, which may, by means of a flexible tube, be connected with an air-pump. A diaphragm of chamois skin fits over the lower, and one of wire-cloth over the upper orifice of the globe, and the tubes above and below those orifices are provided with stop-cocks. For ascertaining the density of the gunpowder, the air is exhausted from the globe by means of the air-pump, until the mercury rises to a certain mark on the graduated tube when the globe is detached from its support and weighed. It is then emptied and cleaned, and a given weight of gunpowder introduced, when it is again attached to the tubes and the air exhausted as before, filling with mercury all the space in the globe not occupied by the powder, up to the mark before indicated. The stop-cocks are now closed, and the globe once more detached and weighed. The absolute specific gravity of the powder is obtained by multiplying the weight of the powder contained in the globe by the known specific gravity of mercury, and dividing the product by the product resulting from multiplying the difference between the weight of the globe when filled with mercury alone, and its weight when filled with mercury and powder, by the weight of the powder employed in the experiment.

Density, a term denoting the quantity of matter per unit of volume in a body. A cubic inch of lead is considered to contain a greater quantity of matter than a cubic inch of wood, and lead is thus said to be more dense than wood. Mass or quantity of matter is measured by its inertia, according to Newton's celebrated 'laws of motion'; or, since Newton has shown experimentally that gravity and inertia are proportional, the mass of a body is measured by its weight. A comparison of the weights of equal bulks of various bodies results therefore in a comparison of their densities. In order to test the densities of various bodies conveniently, a standard substance is fixed on, and the densities of other substances are reckoned by comparison with this. For all liquids and solids, water at a fixed temperature is taken as the standard; and for all gases the standard is common air at a fixed temperature and barometric pressure. There is however some variation in the temperature fixed on, in the first case, and in both the temperature and pressure fixed on in the second. Thus in England the standard temperature for water used to be 60° F. and sometimes 62° F. The latter temperature is mentioned in the legal definition of the imperial gallon. Again, in the case of gases the standard temperature was 60° F. or 62° F., and the standard pressure 30 inches of mercury in the latitude of London.

The metric system on the other hand, makes use of the temperature 4.1° C. (the temperature of the maximum density of water) as the standard for water, and of the pressure 76 centimeters of mercury in latitude 45° as the standard barometric pressure. For gases the temperature

DENSLOW—DENTATUS

o° C. (the melting point of ice) is always employed as the standard. See GRAVITY, SPECIFIC.

Density of the Earth.—The determination of the density of the earth as compared with that of water or any other known body, is a subject which has excited considerable interest among modern mathematicians; and nothing can, at first sight, seem more beyond the reach of human science than the due solution of this problem; yet it has been solved and on such principles that, if it be not exactly correct, it is probably an extremely near approximation. The first idea of determining the density of the earth was suggested by M. Bouguer, in consequence of the attraction of Chimborazo, which affected his plumb-line while he was engaged with Condamine in measuring a degree of the meridian near Quito, Peru. This led to the experiments on the Schehallien Mountain, in Scotland, which were carried on under the direction of Dr. Maskelyne, and afterward submitted to calculation by Dr. Hutton, who determined the density of the earth to be to that of water as $4\frac{1}{2}$ to 1. But in consequence of the specific gravity of the mountain being assumed rather less than it ought to have been, the above result is less than the true density, as has since been shown by Dr. Hutton and Professor Playfair, the former of whom makes it, in his corrected paper, as 99 to 20 or nearly as 5 to 1. The same problem was attempted on similar principles, but in a totally different manner by Henry Cavendish who found the density of the earth to be to that of water as 5.48 to 1. Taking a mean of all these we have the density of the earth to that of water as 5.24 to 1. Two calculations made on quite different principles by two physicists in 1899 showed the surprisingly similar results of 5.5270 and 5.5273.

Denslow, William Wallace, American illustrator: b. Philadelphia 5 May 1856. He studied art at Cooper Institute and at the National Academy of Design, New York. He has been a prolific illustrator since 1872, at first being a traveling illustrator for the leading American newspapers. Among his works are the pictures: 'What's the Use?' 'Victory,' and 'The Heathen Chinese.'

Dent, Frederick Tracy, American soldier: b. White Haven, Mo., 17 Dec. 1820; d. Denver, Col., 24 Dec. 1892. He was graduated from the United States Military Academy at West Point in 1843, and served in the Mexican war, being engaged in the siege of Vera Cruz, and the battles of Churubusco and Molino del Rey. He took part in the Yakima expedition (1856), in the Spokane expedition, and in the Snake River expedition (1860). During the Civil War he commanded a regiment in the Army of the Potomac in 1863; was stationed in New York in September 1863, where riots were feared, and was Grant's aide-de-camp throughout the Richmond campaign. He was secretary to President Grant during his first administration. He retired from active service in 1881, with the rank of brigadier-general in the regular army.

Dental Formula. See TEETH.

Dental Schools. The Baltimore College of Dental Surgery, established 1839, was the first institution of the kind in the world. Other schools in the United States are: Ohio College of Dental Surgery (1845); Pennsylvania Col-

lege of Dental Surgery (1856); Philadelphia Dental College (1863); New York College of Dentistry (1865); and dental departments at Harvard since 1867, University of Michigan since 1875, and University of Pennsylvania since 1878.

Dental Societies. In 1840 the American Society of Dental Surgeons, the pioneer of the associations to which dentistry owes so much of its progress, was organized in New York. The National Association of Dental Faculties, organized in 1884, has done much to strengthen courses of study in dental schools. At the time of its organization only those schools were admitted which had proper facilities for instruction and a corps of competent teachers. From time to time standards have been raised by rules governing attendance, instruction, and graduation. There are at present 47 schools in the association, all of which require three full courses of dental lectures. The National Association of Dental Examiners was organized in 1883 to secure higher and more uniform standards for admission to dental practice.

Dentalium, a genus of mollusks of the class *Scaphopoda*, the shell of which consists of a tubular arcuated cone open at both ends, and resembling the tusk of an elephant in miniature. They bury themselves in the sand, and capture their food, which mainly consists of foraminifers, by means of their tentacles. *Dentalium* is one of the three genera constituting the small class *Scaphopoda*. There are many species, known by the common name of tooth-shells. *D. elephantinum* occurs off the British coasts.

Dentaria, pepper-root, a genus of plants of the natural order *Cruciferae*. There are about 15 species, natives of temperate countries, of which 11 are found in America. They are ornamental herbs, with creeping singularly toothed root-stocks, from which they receive the names of pepper-root and toothwort. The stem-leaves are opposite or in whorls of three, and the flowers are white or pink. The American species extend from Nova Scotia to Florida and west to Minnesota and Louisiana. The best-known is the pepper-root, crinkle-root, or toothwort (*D. laciniata*). The common names refer to the pungent and tooth-like divisions of the root, which is, in some localities, ground and used like horse-radish.

Dentatus, Manius, or Marcus, Curius, Roman statesman, flourished in the first half of the 3d century B.C. His first office was tribune of the people, in which he distinguished himself by his opposition to Appius Claudius Cæcus, who, in defiance of law, refused to receive any votes for plebeian candidates. In 290 B.C. he was consul with P. Cornelius Rufinus, and by his decisive victories over the Samnites terminated a war which had lasted for 49 years. In 275 B.C. he was again consul, and near Beneventum defeated King Pyrrhus. The triumph which followed was one of the most magnificent which had ever been witnessed, and was remarkable for the presence of four elephants, which were then seen for the first time in the streets of Rome. In 274 B.C. he was a third time consul, and after terminating the war with the Lucanians, Samnites, and Brutians, retired to his Sabine farm and spent the remainder of his life in cultivating it.

Den'tex, a genus of acanthopterous fishes near perches. One species (*D. vulgaris*), the *Dentex* of the ancient Romans, abounds in the Mediterranean, and has occasionally been taken on the southern shores of Great Britain. It is voracious, and has large, sharp teeth. It is sometimes seen three feet in length, and 20 to 30 pounds in weight. Great numbers are taken in the mouths of rivers in Dalmatia and the Levant, where they are cut in pieces, and packed in barrels with vinegar and spices, just as the ancients used to treat them.

Den'tifrice (Lat. *dentifricium*, a tooth-powder, *dens*, tooth, *fricare*, to rub), any preparation, liquid or powder, for the purpose of cleaning the teeth. Chalk, precipitated, is generally the base of most of the dentifrices on the market. For detergents, charcoal, cuttlefish-bone or pumice are sometimes incorporated with the milder principle. Bleaching salts and acids find their way in many market preparations, constituting a grave danger to the tooth structure. A few drops of any of the standard antiseptics added to water will often prove an efficient cleanser aided by the friction of the brush.

Den'tils, in architecture, the little cubes or small squarish blocks resembling teeth, into which the square member in the bed-molding of an Ionic Corinthian, composite and occasionally a Roman Doric cornice is divided. Their breadth should be half their height, and the metoche (interval) between them two thirds of their breadth.

Dentin, or **Dentine**, den'tin, the bone-like structure constituting the body of a tooth, which in the crown portion is covered by enamel and in the root portion by the *crusta petrosa* or *cementum*. See **TEETH**.

Dentistry is a special department of the science and art of healing; embracing a knowledge of the structure, physiology, and pathology, and the therapeutic, surgical, and mechanical treatment of the tissues of the mouth and its contained organs, also a knowledge of the materials used and their manipulation in the restoration of the dental and oral structures.

Operations upon the teeth for relief from distress caused by diseases and accidents to which they are subject were doubtless performed concurrently with man's first efforts to relieve his other bodily ills. Dentistry as a distinct vocation is first alluded to in the writings of Herodotus (500 B.C.), but evidences of a much earlier practice are furnished by Egyptian and Hindu records and by the teeth in the crania of some of the earlier aboriginal races. The early Greeks and Romans were evidently familiar to some degree with dental art, for in the celebrated laws of the 'Twelve Tables' (450 B.C.) we find reference thereto in the Tenth Table, as follows: *Neve aurum addito: cui auro dentes juncti escunt, ast in cum illo sepeliet, uretve se fraude esto.* "If anyone's teeth have been bound together with gold it shall not be unlawful to bury him with it." It is probable that the Romans derived their knowledge of dental art from the Etruscans, who in turn derived theirs from the Egyptians, the fountain-head of the arts and sciences. Of the growth of dental art from the time of Hippocrates until the Christian Era but little is recorded, and even thereafter, until the

17th century, such advances as were made in a knowledge of the teeth were largely in relation to their structure and functions, but the recorded observations were much influenced by the superstition and ignorance of the time, and are consequently of but little value. The observations of Antoni van Leeuwenhoek of Delft, Holland, on the anatomy of the teeth, published in 1678, contained an account of his discovery of the tubular structure of the dentin—a discovery made possible by the aid of a crude form of microscope which the author had invented. Up to this period operations upon the teeth were largely practised by surgeons and not infrequently by barbers, and were limited principally to extraction and the treatment of toothache and abscesses or inflammatory disorders of the soft tissues surrounding the teeth. The restoration of teeth by mechanical means and the filling of cavities caused by decay of their structure called for a type of skill which the training of the surgeon and physician did not furnish, hence there was developed from the crafts of the artisan, the goldsmith and the workers in precious metals, the dental mechanic, whose skill enabled him to devise and fashion the substitutes for lost dental organs, an art which later, as a result of systematic study and organized professional training, has developed a high degree of perfection.

The development of modern dentistry as a professional calling has had a distinctly double origin: first, as an outgrowth of medicine and surgery, certain practitioners of these arts in the earlier days devoting themselves to dental practice and adding to their medical qualifications such technical and manipulative skill as enabled them to meet the public demand for restorative operations upon the teeth; second, the artisan or mechanic dentist who acquired so much of medical and surgical knowledge as enabled him to treat with some measure of success the dental diseases with which his calling confronted him. In England at the beginning of the 19th century the best practitioners of dentistry were medically educated men, of whom Joseph Fox, lecturer on diseases of the teeth at Guy's Hospital, London, may be taken as the type. Both Fox and his successor, Thomas Bell, published works on diseases of the teeth which for their time were standards. The works of other British writers on the same subject, notably those of Koecker, Jobson, Waite, and Alexander Nasmyth, all made their appearance in the first half of the 19th century. The works of these English practitioners and teachers were characteristic of the medically and surgically educated practitioners in that the anatomical, pathological, and therapeutic departments of dental science and practice were strongly emphasized by them, while the manipulative phase and restorative department of dental art were given a minimal recognition.

Of the earliest origin of the art of mechanically restoring lost dental structures the records are obscure. Jaws in which natural teeth or carved imitations of them were inserted and retained by means of gold bands affixed to adjoining sound teeth have been found in early Etruscan tombs—specimens of this character being preserved in the museum of Pope Julius in Rome and elsewhere. Specimens of similar restorations are also recorded as having been found in the mouths of Egyptian mummies. No rec-

DENTISTRY

ord, however, of a systematic presentation of this department of dental art is known to have been published until the work of Pierre Fauchard made its appearance in France (1728). This treatise upon the art of dentistry was most complete for that period, and so great was its originality that its author has with much justice been called the "father of modern dentistry." Fauchard was born in Brittany (1680) and died in Paris (1761). In the preface to his book he makes the following interesting statement regarding the then existing status of dentistry: "The most celebrated surgeons having abandoned this branch of surgery, or at least having but little cultivated it, the negligence has been the cause of its being embraced by those who, without theory and without experience, practise it without principles or methods. It is only recently that in the city of Paris the eyes have been opened to this abuse, and an easy examination is required of those who devote themselves to the treatment of these diseases, after which they are granted the title of Experts upon the Teeth, although several among them are only provided with a knowledge below mediocre." As it was provided that the examination referred to should be conducted by "men learned in all branches of medical science" who should decide upon the merits of the applicant, we have in this measure the first recorded attempt at the statutory regulation of dental practice which is now a generally exercised safeguard to the public health in all nations. The work of Fauchard gave an impulse to the practice of dental art and tended to specialize it as a distinct calling; it was the art of Fauchard which was implanted upon American soil by the French dentist, Joseph Lemaire, a surgeon attached to the forces of Count Rochambeau, whose army was quartered with the Colonial troops near Providence, R. I., during the winter of 1781-2. Although Lemaire had been preceded in 1756 by one Robert Woofendale, a student of Thomas Berdmore, dentist to His Majesty King George III., and probably by one or two others of whom the records are obscure, the importance of Lemaire's visitation attaches to the fact that he took occasion to instruct in his art Josiah Flagg, a young man holding a major's commission in the Colonial army, and he thus educated the first dentist native to this country. Another who profited by Lemaire's instruction along with Josiah Flagg was James Gardette who arrived with the French fleet in the capacity of naval surgeon, but who through his interest in the work of Lemaire turned his attention to dentistry and after the close of the war went to Boston, thence to New York in 1783, and finally in the autumn of 1784 settled in Philadelphia, where he practised his profession as dentist until 1829, when he returned to France and died in Bordeaux (1831). The career of Gardette as a dental practitioner was remarkable not only from a financial standpoint, but by reason of the intelligence which he exercised in his calling and the ingenuity and skill which characterized his work. He added many useful improvements to dental art and attained much prominence as a skilled and ethical professional man.

Early in the 19th century several dentists who did much to elevate dental practice and place it upon a professional plane arrived in America from Europe. Edward Hudson, a na-

tive of Ireland, and Leonard Koecker, of Germany, both of whom practised in Philadelphia, were noted for their excellence as practitioners and their high professional standing. These early pioneers of American dentistry were practitioners *sui generis*. Their means of education and professional training were limited to what they could obtain from preceptors and the scanty literature of the time, but what they lacked in educational facilities was more than compensated by their natural ability and enthusiasm, and so excellent were the standards which they raised that much that is best in modern dentistry is to be justly credited to their almost unaided achievement and professional example. The success of the early practitioners and the increasing demand for dental service coincident with the growing population, brought about a corresponding increase in the number of those who offered their services to the community as dentists. There being no legal restrictions upon practice, anyone might advertise himself as a dentist regardless of his qualifications for the practice of that specialty, hence, tempted by the emoluments and position which dentistry seemed to offer, many incompetents engaged therein and charlatanism was rife. The only means of obtaining a practical knowledge of the art of dentistry was through the instruction of a preceptor who had similarly acquired it, hence the instruction of apprentices became a lucrative business, as large fees were charged for initiating the novice into the art and mystery of dental practice. The knowledge thus gained at considerable cost and having a commercial value was jealously guarded, and with but few exceptions professional intercourse among practitioners was an unknown feature. This deplorable condition of affairs becoming intolerable to those dentists of more liberal tendencies, an attempt was successfully made in New York in 1787 to organize a local association of dentists, and in 1840 in the same city a national association, the American Society of Dental Surgeons, was organized, mainly through the efforts of Dr. Horace H. Hayden of Baltimore, "to advance the science by free communication and interchange of sentiments."

The year previous to that which saw the creation of the American Society of Dental Surgeons the first dental journal in the world had been established through the instrumentality of Dr. Chapin A. Harris, who had enlisted a number of the more liberal and enthusiastic of his colleagues in the enterprise, and in 1840 the first college in the world for the systematic education of dentists, the Baltimore College of Dental Surgery, opened its first course of lectures and laboratory instruction in the science and art of dentistry. The charter for the institution, which is still in successful operation, was obtained from the legislature of Maryland by Drs. Harris, Hayden, and others. In the years 1839-40 there were thus established the three essential factors of professional growth in dentistry—the college, the association, and the journal. The establishment of these means of systematic dental education upon an independent basis with a separate organization for associated work among dental practitioners led to the growth of dentistry as a professional calling, distinct from medicine, although it is essentially a department of the science and art of

DENTISTRY

healing by virtue of the fact that it deals with the diseases of a most important part of the human organism, which have intimate vital relationships with the entire body, and for its successful practice demands as broad a knowledge of the fundamental medical sciences as that required by the practitioner of any other medical specialty.

The distinguishing factor of dental training, and one which is not required to the same degree in any other department of the healing art, is the manual skill and mechanical training needed for the successful practice of the prosthetic or restorative operations which the dentist is constantly called upon to perform. It was the lack of facilities in medical schools for obtaining the necessary training in the mechanical procedures of dental art that led to the establishment of the first dental college and placed dental education upon a basis independent of general medical education. The increase in knowledge of the diseases of the mouth and its contained organs and the growing recognition of the vital relationships of the oral tissues to the body as a whole, have gradually compelled the broadening of the dental educational curriculum until at present all of the fundamental medical sciences are included in the *curricula* of the best dental colleges, and upon this scientific foundation is erected the superstructure of technical education and manual training necessary to the art of the dentist.

The development of dentistry in America has been phenomenal, especially in all that pertains to its art side. The incorporation of the systematic teaching of mechanical dentistry in the college course instead of depending upon the uncertain educational results of the apprenticeship system has had greatly to do with creating a body of American practitioners skilled in their art. It is in fact for his skill as an operative dentist that the American practitioner has been mainly distinguished, while his contributions to the scientific basis of dentistry have been on the whole less voluminous than those of European practitioners, especially in the domain of original scientific research. The art of replacing lost portions of tooth crowns by gold fillings has had its greatest development in America, indeed as we know the operation to-day it may be said to have originated there. As originally practised the ideal gold filling was one which simply acted as a stopper inserted in a cavity produced by decay, for the purpose of excluding moisture and furnishing a surface sufficiently resistant to withstand the wear and tear of mastication. The filling was finished on a level with the cavity margins and no attempt was made to restore the lost contour of the tooth in imitation of its natural configuration. When, however, the discovery of the cohesive property of annealed gold foil was made and promulgated by Dr. Robert Arthur, of Baltimore, in 1855, the whole method of filling teeth with gold was revolutionized and complete artistic restoration of the normal configuration of the tooth by building with gold foil became the accepted ideal of practice. In connection with the general use of cohesive gold as a filling material certain ingenious and important devices came into existence as adjuncts to the operation of tooth-filling, having their origin in the necessities of the case. These were the dental engine, the mallet, and the rubber coffer-dam.

The operation of preparing the cavity for the reception of the gold involves the removal of decayed portions and frail margins, and giving to the cavity a retentive shape, so that the filling when inserted shall be solidly and immovably held in place. The early methods of cavity preparation were laboriously performed by small chisels and cutting instruments manipulated exclusively by the hand. Hand instruments were also exclusively used for the insertion and condensation of the gold foil in building the filling and subsequently giving it the required form and surface finish. The introduction of the dental engine run by foot-power, or as in its more recent modifications by electric motor, has not only greatly facilitated the operation of tooth-filling but has made possible more accurate and perfect results. So manifold have been the improvements made in the dental engine and its equipment of accessory appliances that it may, if the operator so desire, be used for every step of the operation from cavity preparation to the finished filling. As the cohesive property of gold, upon which its value in restoring the form of the tooth depends, is at once destroyed by contact with moisture, great difficulty was formerly experienced during large filling operations in excluding the gold from contact with saliva; napkins, bibulous paper and various mechanical devices were used for the purpose, but were often insufficient to prevent the destruction of a filling during the progress of its insertion. The device known as the rubber dam, introduced by Dr. S. C. Barnum of New York, about 1865, solved the problem of effectually excluding moisture from the teeth undergoing the filling operation and made possible more extensive and thorough restorations than had previously been attempted. The discovery of the usefulness of the cohesive property of gold in filling operations soon brought into requisition other means than simple hand pressure for condensing the gold foil into a solid homogeneous mass. It was soon found that greater solidity could be obtained by the percussive force of a mallet applied to the gold through the plugging instrument, so that the use of the mallet became general for the purpose, largely through the persistent advocacy of Dr. W. H. Atkinson of New York. The earlier forms of condensing mallets were simply hand mallets with heads made of various materials and different weights to attain desired variations in the impact and quality of the blow delivered upon the condensing instrument. Later, automatic mallets combining a plugging instrument and mallet were introduced. In these instruments the blow was produced by a hammer propelled by the release of a spring compressed by pressure, the malleting mechanism being contained in a casing connected with the plugging point which was applied to the surface of the filling upon which the impact of the blow was ultimately expended. In 1867, Dr. W. G. A. Bonwill, of Philadelphia, introduced his electromagnetic mallet, an instrument which involved the principle of the Morse telegraphic recorder so modified that the armature of the electro-magnet was effectively utilized as a mallet acting upon the free end of the gold-plugging instrument. With the automatic interrupter of the current afterward added to it the Bonwill instrument contributed greatly to the improvement of gold-filling operations both in the solid-

DENTISTRY

ity of the gold, its more accurate adaptation to the walls of the cavity, and in lessening the fatigue and discomfort of both patient and operator incident to the operation. The blows delivered by the electro-magnetic mallet while light are extremely rapid, an advantage which its inventor sought to realize in a later device, to be used in connection with the dental engine, known as the Bonwill engine mallet, an instrument of high efficiency and the parent device of many subsequent modifications.

The extensive use of gold as a filling material and the perfection to which the technique of its use for that purpose has been developed, especially in America, has recently brought about a reactive tendency against the display of elaborate operations of gold, especially in conspicuous positions in the front teeth, æsthetic considerations stimulating the search for some substitute more in harmony with the texture and color of human teeth. Recently through the invention of an improved technique by Dr. C. H. Land of Detroit, Mich., and the further investigations of Dr. N. S. Jenkins, an American dentist resident in Dresden, Germany, the use of porcelain as a restorative material has become practically possible and bids fair to supplant gold as a filling, at least in conspicuous situations. The durability of porcelain restorations as compared with gold fillings remains to be tested by time and experience, but the immediate result is in all respects in favor of porcelain, especially in the matter of appearance, which so harmonizes with the teeth structure in color and texture as to be invisible when the operation is correctly performed. The filling of cavities is also extensively done with plastic materials that have the property of becoming hard in the course of time after having been inserted in a soft state. This class of materials includes the amalgams and cements, also gutta-percha. Certain of these materials, the cements for example, serve only a temporary purpose, and their usefulness is therefore of limited duration. The amalgams, however, while unsightly in appearance, are extremely useful; being quite durable and capable of insertion without great difficulty, they can be used in cases of great loss of tooth structure, thus restoring many cases that could not otherwise be as successfully treated, and with less cost than gold filling.

Following the researches of Koch in bacterial pathology, the role played by micro-organisms in the causation of dental diseases became the subject of study by numerous investigators, notably Prof. W. D. Miller, an American dentist resident in Berlin, through whose researches the cause of tooth decay was explained. Similarly the causal relation of disease-producing micro-organisms to disorders of the dental pulp and the tissues surrounding the roots of teeth has been clearly made out, with the result that operations upon the pulp chambers and root canals of teeth in which the pulp has been devitalized by disease or design are now among the recognized conservative operations of dentistry. This advance in the treatment of pulpless teeth has made possible the permanent saving of multitudes of teeth in a condition of comfort and functional usefulness which were previously inevitably sacrificed or lost. Later investigations in the domain of dental and oral pathology are throwing light upon the causes and improving the modes of treatment

of those diseases of the retaining tissues of the teeth which when unchecked result in their early loss by destruction of their attachment to the gums and alveolar sockets.

Dental art has in the development of its operative technique compassed the problem of defective tooth restoration, and has made possible the restoration not only of any portion of a single tooth, but of a whole tooth or any number of missing teeth. Where roots of teeth remain and are not hopelessly diseased or fractured, they form the foundations for that class of restoration known as crown- and bridge-work, the desirability and efficiency of which is directly proportioned to the skill and judgment expended upon its execution.

The grafting of artificial crowns of porcelain upon healthy natural roots is accomplished in a large variety of ways, the attachment being by metallic dowels cemented into the properly enlarged pulp canal of the root, this being in most cases reinforced by means of a gold collar or ferrule connected with the porcelain crown, closely encircling the periphery of the root at and slightly under the gum margin. Perfect adaptation of the crown and root end is obtained by correctly shaping the exposed portion of the root and then fitting to it a thin gold base-plate, to which is adapted the dowel and ferrule, after which the properly fitted porcelain crown is attached to this foundation by gold solder and a backing plate of gold connecting with the platinum pins of the crown. In certain cases hollow crowns made entirely of gold plate shaped to the contour of the original natural crown are used upon the roots of the grinding teeth instead of porcelain crowns, as they possess the advantage of superior durability. Aggregations of crowns permanently united upon their contiguous surfaces and supporting crowns in spaces where teeth have been extracted constitute so-called bridge work. No restorative operation in dentistry requires more judgment and skill, nor has any dental procedure been more abused in its performance than bridge work. Where the operation is intelligently and skilfully done, it constitutes the most satisfactory result both as to comfort, utility, and appearance, that prosthetic dentistry has yet attained; otherwise it defeats the very object for which only it should be undertaken, namely, the restoration of the denture to full functional usefulness and æsthetic appearance.

The department of dentistry technically known as mechanical or prosthetic dentistry comprises all those operations and the laboratory manipulation of the materials involved in the construction of substitutes for lost dental organs and parts of the oral tissues. Where lost teeth are to be replaced by means other than those described as crown and bridge work, it is done by mounting the porcelain crowns upon a base-plate adapted to the surface of the alveolar ridge and in the upper jaw usually to the surface of the palatal vault as well. An impression of the alveolar arch is taken in an impression tray containing a plastic material, which will subsequently harden, usually plaster of Paris or a modeling compound consisting of gum kauri, stearin, and talc; beeswax or beeswax and gutta-percha have been used, but are now practically abandoned for this purpose. Into the matrix formed by the impression a batter of plaster of Paris is poured, which after it has

DENTISTRY IN THE UNITED STATES

hardened forms the cast upon which the base-plate to support the artificial teeth in the mouth is constructed. The base-plate may be of vulcanite or of metal, and in the former case the porcelain teeth are adjusted to the cast by means of wax, and a wax plate is constructed which is the counterpart of the projected finished vulcanite plate. When the arrangement of the teeth to the wax trial plate has been found to be satisfactory by actual trial in the mouth of the patient, it is returned to the cast and the whole embedded in plaster of Paris contained in a sectional iron vulcanizing flask, similar in construction to the molding-flask of the brass or iron founder. The upper and lower sections of the flask are separated after the investing plaster of Paris has fully hardened, and the wax is completely removed by a stream of boiling water, leaving a facsimile matrix in the plaster, which is then packed full of vulcanizable caoutchouc; the flask is then closed, and after being firmly bolted together is subjected to the action of the heat from superheated steam for about an hour at 320° F. in a vulcanizer. The case is allowed to cool, and when removed from the matrix the now thoroughly hardened plate is finished with a fine polish and is ready for insertion in the mouth. Metallic plates serving as the base of support for artificial teeth are constructed by stamping or swaging the flat plate cut approximately to the desired pattern, between male and female dies made from zinc and lead respectively, which have been obtained by casting the molten zinc into a sand matrix made from the plaster of Paris model of the alveolar arches. This furnishes a zinc model or male die, upon which a female die or counter-die of lead is cast, and between these the metallic base-plate is struck up to the form of the alveolar arch upon which it is intended to rest. Upon this base-plate porcelain teeth are fitted and attached by a metallic connection between the platinum pins (which for the purpose are baked in the porcelain texture of the artificial teeth) and the base-plate, union being made by soldering. Dentures upon an enameled platinum base-plate constitute a form of work known as continuous gum work, in which, after the teeth by means of their pins have been united to the plate by soldering with pure gold, porcelain paste or "body" as it is technically called, is packed around the roots and between the teeth; then carved into form until the natural contour is reproduced. The piece is then subjected to high heat in a muffle until vitrified, after the manner of firing or baking china or pottery. It is next given a coating of enamel in imitation of the natural gum color, and after this has been fused in the muffle and the piece finally finished, it constitutes the most artistic, hygienic, and anatomically perfect denture of which dental art is capable.

The prosthetic department includes, besides the restoration of lost teeth, the construction of mechanism for the correction of palatal defects, whereby imperfect speech and deglutition are restored to practically normal condition; it includes also the construction of splints in the treatment of fractures of the jaws and the restoration of parts of the jaws lost by accident or disease; construction of mechanism for the correction of irregular positions of the teeth and for the restoration of facial deformities due to irregular or imperfect development of the jaws and

bones of the nasal or facial regions. The correction of irregularities in the position of the teeth has developed such importance and covers such a wide field of study and work as to constitute a distinct specialty of modern dental practice. This department of dentistry is termed *orthodontia*; its importance is due not only to the cosmetic value of its results, but because of the direct bearing which irregular positions of the teeth and deformities of the dental arches exert upon the bodily health.

The whole field of dental and oral pathology has been so far developed by study and research as to place modern dental practice distinctly among the recognized specialties of the healing art. Most of the bacteria causing general bodily disease find access to the system through the mouth, which is also the habitat of many bacteria, benign and disease-producing as well. Hence the hygienic care of the mouth as a protection against disease invasion is of the utmost importance. Late researches have shown that the mouth, its tissues and its secretions, and the teeth themselves, furnish important indications of certain bodily diseases, malnutrition, etc., which are extremely valuable as diagnostic means. The training of the dental practitioner has therefore been enlarged so that in the foundation elements it is now coextensive with that of the practitioner of general medicine, but specialized with reference to its particular field of inquiry.

EDWARD C. KIRK,
Editor 'Dental Cosmos.'

Dentistry in the United States. From the earliest times dentistry was practised as a branch of surgery. Herodotus speaks of means of preserving the teeth, and artificial teeth are alluded to by Greek and Latin poets. Within the last half century dentistry has become a distinct profession. The Baltimore College of Dental Surgery, established in 1839, was the first institution of the kind in the world. It was the direct result of an agitation to put dentists on a higher professional plane, and followed an unsuccessful attempt to found dental chairs in medical schools. It had been argued that oral pathology and dental mechanics should be taught in the medical schools as branches of medicine and that graduates choosing these courses should receive the degree of M.D. as in the case of other branches of medicine. In the same year the 'American Journal of Dental Science,' the first dental periodical in the world, was established. In 1845 the Ohio College of Dental Surgery (since 1888 the dental department of the University of Cincinnati), in 1856 the Pennsylvania College of Dental Surgery, in 1863 the Philadelphia Dental College were founded. These separate schools taught at first very little medicine, but paid attention almost

DENTISTRY IN THE UNITED STATES

entirely to mechanical training and to those branches which a dentist must know. All conferred the degree of D.D.S. In 1865 the New York College of Dentistry was founded with the purpose of educating men to practise dental surgery as a specialty of medicine. The curriculum included the fundamental departments of medicine with operative dentistry and oral prosthetics. In 1867 Harvard University opened a dental department and began to teach dentistry as a branch of medicine with the special degree D.M.D. (*Dentariae medicinae doctor*). In 1875 the University of Michigan and in 1878 the University of Pennsylvania followed the example of Harvard in opening dental departments. Forty of the 56 dental schools are now departments of other institutions. Since 1878 there has been a most astonishing increase in dental schools and dental students, due largely to the fact that the dental laws in many States now require graduation from a dental school as a condition for license. In 1878 there were 12 schools and 701 students; in 1902 there were 56 schools and 8,420 students. The number of practitioners of dentistry at present in the United States is about 27,000; upward of 60 institutions are devoted to the systematic education of dentists; the profession has an extensive literature of standard works and periodical publications, and the furnishing of supplies and material used in dental practice is an enormous industry involving millions of capital, a growth which has all developed within 60 years.

In 1840 the American Society of Dental Surgeons, the pioneer of the associations to which dentistry owes so much of its progress, was organized in New York. The National Association of Dental Faculties, organized in 1884, has done much to strengthen courses of study in dental schools. At the time of its organization only those schools were admitted which had proper facilities for instruction and a corps of competent teachers. From time to time standards have been raised by rules governing attendance, instruction, and graduation. There are at present 51 schools in the association, all of which require three full courses of dental lectures. The main defect of these schools as a rule is failure to require a sufficient preliminary general education for admission. The National Association of Dental Examiners was organized in 1883 to secure higher and more uniform standards for admission to dental practice. The entrance requirements of these associations are equivalent to at least two years of high school work.

In Alabama, in 1841, the first State law regulating the practice of dentistry was enacted. This was probably the first dental legislation in any country. The next State to pass a dental law was New York, but this action was not taken till 1868. The English law was enacted in 1878, and those of other countries about that time or later.

Supervision.—The practice of dentistry is now regulated by statute in 52 political divisions of the United States.

In Alaska and Indian Territory, no statutory enactments are given. Examining boards are appointed in Alabama, Kentucky, North Carolina and South Carolina by the State dental associations; in District of Columbia by district commissioners; in Indiana by the governor, State Board of Health and dental asso-

ciation; in Nebraska by State Board of Health; in New York by the University of the State of New York; in Philippines by the Board of Health; in the remaining divisions by the governor, on recommendation, usually, of the state dental societies.

Licensing.—Interchange of licenses is highly desirable and will doubtless be brought about to some extent in the near future. An important step toward interchange of licenses was taken in 1898 when the New York dental law was amended so that the Regents may now issue their license to any applicant who holds a license to practise dentistry granted by a State board of dental examiners, indorsed by the Dental Society of the State of New York, provided that his preliminary and professional education meets the New York statutory requirements. The dental examiners of Pennsylvania having been indorsed by the New York State dental society and recommended by the State dental examiners, the regents indorse Pennsylvania licenses granted under the new régime.

Licentiates of Other States.—Indiana admits licentiates of other States having equal requirements on "signification of reciprocal courtesy"; Illinois on approved diploma from reputable dental or medical college, or on 10 years' practice; New Jersey and Pennsylvania, on proof of license from other State boards having equal requirements; New Mexico and Utah, on proof of diploma recognized by National association dental examiners; New York, on proof of license from another State board having equal requirements and indorsed by the New York State dental society, or on graduation from a registered dental school and six years' practice; District of Columbia, Louisiana, Michigan, Missouri, Nebraska, Nevada, North Dakota, Oklahoma, South Dakota, Tennessee, Wisconsin, on approved diploma from other States; Kansas, Kentucky, Ohio, Texas, on approved diploma from a dental college in the United States or any foreign country. In the remaining political divisions no provision is made in the law for admission of licentiates of other States.

Synopsis of Requirements, Jan. 1, 1904.—In 33 divisions dental diplomas do not now confer the right to practise, an examination being required in all cases: Alabama, Arizona, California, Colorado, Connecticut, Delaware, Florida, Georgia, Hawaii, Idaho, Indiana, Iowa, Maine, Massachusetts, Minnesota, Mississippi, Montana, New Hampshire, New Jersey, New York, North Carolina, Ohio, Oregon, Pennsylvania, Philippines, Rhode Island, South Carolina, Utah, Vermont, Virginia, Washington, West Virginia.

The following require for admission to the licensing examination: Arizona, diploma recognized by N. A. D. E. or four-year high school course and three years' apprenticeship, or five years' practice.

California, diploma of reputable dental school indorsed by State board of dental examiners, or three-year high school course and four years' dental apprenticeship, or certificate of examining board of another State showing five years' practice.

Colorado, diploma from legally organized reputable dental school.

Connecticut, diploma from recognized dental school, or three years' instruction, or three years' practice.

DENTISTS—DENTITION

Delaware, diploma of recognized dental school.

Florida, diploma from reputable dental school.

Georgia and Hawaii, diploma from reputable dental school.

Idaho, three years' experience, certificate from another State board, or diploma from legally organized dental school.

Indiana, diploma recognized by N. A. D. F., or five years as assistant to licensed dentist.

Iowa, diploma from reputable dental school.

Minnesota, diploma from reputable dental school, or evidence of 10 years' continuous practice previous to September 1889.

Montana, diploma of reputable dental school, or five years' dental practice, or five years' study under licensed dentist.

New Jersey, common school education, diploma from recognized dental school or a written recommendation from five experienced dentists.

New York, full high school course, degree from registered dental school or medical degree with a special two-year dental course.

Ohio, diploma from legally chartered dental school.

Oregon, diploma from dental school in good standing, or study and practice in Oregon prior to this act.

Pennsylvania, three-year high school course, diploma of recognized dental school.

Philippines, diploma from legally incorporated dental school.

Utah, diploma recognized by N. A. D. E., or two years' practice or three years' study with licensed dentist.

Virginia, a fair academic education.

Washington, diploma from recognized dental school.

The following require the licensing examination only:

Alabama, Maine, Massachusetts, Mississippi, New Hampshire, North Carolina, Rhode Island, South Carolina, Vermont, West Virginia.

In the following political divisions either approval of dental diploma or examination by State or other duly qualified board is required:

District of Columbia, Illinois, Kansas, Kentucky, Louisiana, Maryland, Michigan, Missouri, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, South Dakota, Tennessee, Texas, Wisconsin.

The following, requiring either approval of diploma or examination, admit to examination on:

Missouri, three years' study with legally registered dentist or license from another State.

North Dakota, three years' active practice or three years' study with practitioner.

South Dakota, three years' practice or three years' study with practitioner.

Wisconsin, diploma from approved incorporated dental school or four years' practice or five years' apprenticeship.

One State, Wyoming, requires only presentation of diploma to unqualified local officers.

Porto Rico admits to practice on diploma approved by the superior board of health.

JAMES RUSSELL PARSONS, JR.,
University of the State of New York.

Dentists. About the time of the Revolutionary War, dentists came to the United

States from England and France. They included Woffendale, who arrived in 1766; Gardette, a French surgeon, 1778; and Lemaire, a French dentist, 1781, who accompanied the Comte de Rochambeau's army. While the Continental forces were in quarters at Providence, R. I., during the winter of 1781-2, Lemaire found opportunity for the practice of dentistry and also for the instruction of one or two students, particularly Josiah Flogg, who commenced practice in 1782, and was, so far as can now be ascertained, the first American dentist. John Greenwood, who became a practitioner about 1784, made sets of artificial teeth for General Washington. American dentists have made important contributions to the progress of dentistry. The dental engine, in its original form, was devised by Morrison in 1846. About 1855 Arthur discovered that gold-foil, which had previously been without cohesiveness, might be made cohesive by being passed through an alcohol flame. Atkinson first recommended the mallet as aid to the filling of teeth with gold. Barnum invented (1864) the rubber dam, which protects the field of operation from moisture during filling, and is also a means of excluding bacteria. Its value has been found to be decided. Richardson was the earliest to advocate (1857) the employment of a galvanic current as a means of inserting drugs into the tissues, though this method has been applied only comparatively recently. Wells discovered the application to dentistry of nitrous oxide, commonly known as "laughing gas." This is the anæsthetic now generally employed for extraction. Charles Goodyear in 1855 obtained in England a patent for a process of making a dental plate of hard rubber (caoutchouc). Artificial teeth were secured in this as a support before its vulcanization. Patents were also secured on subsequent improvements, and the vulcanite base has been of considerable benefit. The enameled platinum denture, used in what is sometimes styled the continuous gum method, was perfected by Allen in about 1846-7. By this method porcelain teeth are secured to a base-plate of platinum; a porcelain paste is then applied to the plate and covered with vitreous enamel. Mention should be made of the researches of Andrews, Black, and Sudduth in dental science. Numerous authoritative works on dental practice have been written and published in America. A 'History of Dental and Oral Science in America' (1876) was published by Dexter. Consult also Wedgwood, 'Progress of Oral Surgery' (1891).

Dentition, including both the formation and the cutting of the teeth, is one of the most important organic processes of childhood and adolescence. The pulpy nucleus constituting the tooth germ appears about the third month of pregnancy, and at the end of it the jaws contain the 20 follicles which are to produce the first teeth. Those of the second dentition appear from the fifth to the ninth month of fetal life, but some do not appear before the end of the second year. The first teeth are usually cut in the last six months of the first year. The central incisors of the lower jaw show themselves first, then come incisors of the upper jaw; the other teeth follow, proceeding in order from the centre backward, except in the case of the canines, which in general make their appearance only be-

D'ENTRECASTEAUX ISLANDS — DENUDATION

fore the four last molars. The number of teeth is then 20. All are temporary and are replaced by those of the second dentition. The first dentition is usually completed during the last months of the second year. In some instances children have been born with teeth, and in many instances the first teeth do not make their appearance till after the 10th or even the 12th month. At the age of $6\frac{1}{2}$ to 7, secondary teeth commence erupting and the first permanent molar, called the six-year molar, makes its appearance. At the same time the roots of the temporary teeth being resorbed the teeth themselves become loose, fall out, and are replaced in the same order as at the original cutting. The renewal of the incisors commences about the seventh and is not completed till the ninth year. Toward the 10th year the first permanent molar or bicuspid appears, next the canine, and then the second bicuspid. The bicuspids are of less size than the molars which they replace, the incisors and canines on the contrary are larger. On the regularity of these proportions depends the greater or less facility in the arrangement of the teeth subsequently cut. From $10\frac{1}{2}$ to 11 years the second great molars appear, and last of all, usually from 18 to 25, the teething is completed by the cutting of the last molars or wisdom teeth. Besides the differences already mentioned between the first and second teeth, the incisors of the latter present on their anterior face two salient lines parallel to the axis of the tooth, and the roots of all of them are larger than those of the former. When the dental process is being performed the bones, which are its site, receive a development proportioned to the augmentation of the teeth in number and volume.

D'Entrecasteaux Islands, dän-tr-käs-tō, since 1884 part of the British protectorate of New Guinea, lie north of the southeast extremity of New Guinea; area 1,083 square miles. They comprise three chief islands separated by narrow channels. They are named after the French admiral and explorer, Bruni D'Entrecasteaux (1739-93), who visited these waters in 1792. His name is also preserved in D'Entrecasteaux Point on the southwest coast of western Australia; and in D'Entrecasteaux Channel, separating the south of Tasmania from Bruné Island. The islands contain boiling springs and other indications of volcanic action. The natives though described as head hunters are said to be skilled agriculturists.

Denudation, the laying bare of underlying rocks by the removal of superficial matter, and also the process by which the earth's surface is broken up and the loose material carried away, chiefly by the action of wind, rain, running water, frost, snow, ice, the sea, plants, and animals. The action of wind is seen in the erosion of rocks produced by the sand and grit which in certain dry regions is swept by the winds against projecting rocks, an action often resulting in the undermining of cliffs and the downfall of rock-masses. Rain is also a potent agent of denudation, its action being both chemical and mechanical. Rocks are more or less altered and decayed, and the decomposed materials carried off in solution by rain-water. In many places the rocks are thus "weathered" to considerable depths, the decomposed crusts varying in thickness from a mere line up to many

feet or even yards. The mechanical action of rain consists chiefly in the sweeping away of this disintegrated material. Running water acts also chemically and mechanically. Thus, the rain that sinks underground and rises to the surface again in springs, brings about many changes in rocks. Immense quantities of mineral matter are brought up in solution, and thus, in time, underground cavities are formed, especially in the more soluble rocks. In regions of calcareous rocks, the whole drainage is sometimes conducted underground. This action of underground water often brings about local subsidences, falls of rocks, and great landslips. The denuding action of superficial terrestrial waters is seen in the excavation of gullies, ravines, and river-valleys, one of the most remarkable examples of river erosion being the Grand Cañon of the Colorado (q.v.).

Frost acts with great intensity at high levels and in high latitudes, but even in temperate regions its action is very marked and productive of great disintegration of rocks. Glaciers are likewise powerful denuding agents. They are not only instrumental in transporting the rock-rubbish which is showered down upon them from overhanging cliffs, etc. (see BOULDERS), but by means of the blocks and debris which they drag forward on their beds, they grind, furrow, and smooth the rocks over which they flow. The sea, again, acts like a great horizontal saw, which is continually rasping away the rocks along the coast.

Nor can the destructive action of plants and animals be ignored. Plants send their roots into rock-crevices and wedging the masses asunder, aid the freer percolation of water, and prepare the way for the better action of frost. The destructive action of animals, again, is seen in the weakening of rocks on a sea-coast produced by the drilling and boring of *Saxicava*, *Pholas*, etc., and by annelids, echini, and sponges. Rocks so weakened fall more readily before the battering of waves and breakers. Little change may be perceptible, but an examination of the rocks shows that many thousands of feet of solid strata have been gradually removed from the surface of a country. Thus, in many districts where faults occur, no inequality at the surface betrays the presence of dislocations; the whole area has been reduced by denudation to the same level, hundreds or even thousands of feet of strata having been removed from the upcast side of the faults (see DISLOCATION). Denudation proceeds more rapidly in some regions than in others; therefore, the work of no individual river can be taken as a standard by which to estimate the general rate of erosion. Much depends on physical and climatic conditions, and much on the geological structure of a country and the composition of its prevalent rock-masses. Thus, the Mississippi is said to remove from the general surface of its basin one foot in 6,000 years, the Rhone one foot in 1,528 years, the Po one foot in 729 years. Rivers like the Rhine, the Danube, the Elbe, and the Rhone, contain in every 6,000 parts by weight one part of dissolved mineral substance. These rivers, therefore, carry seaward their own weight of dissolved matter in 6,000 years. Consult: Playfair, 'Illustrations of the Huttonian Theory'; Lyell, 'Principles of Geology'; Croll, 'Climate and Time,' and the standard text-books of geology.

DENVER

Denver, James W., American soldier and frontiersman: b. Winchester, Va., 1817; d. 9 Aug. 1892. He removed to Ohio with his father in 1830, where he studied for the bar. Later removed to Missouri, where he raised a company and served in the Mexican war. In 1850 he went to California where he became prominent in politics and was elected secretary of state, and afterward elected to the 34th Congress. Before the end of his congressional term he was appointed commissioner of Indian affairs, but resigned to accept the office of governor of the Territory of Kansas. He returned to Washington after 12 months of service leaving the territory well organized and law-abiding. He returned to California in 1859, but soon after removed to Wilmington, O. He served in the Union army during the Civil War until 1863. Gen. Denver suggested the name Colorado for the Territory formed out of Kansas, and the city of Denver was named in his honor.

Denver, the capital of the State of Colorado, organized 17 Nov. 1858, and named in honor of Gen. James W. Denver, the first governor of the Territory of Kansas, which at that time included Colorado in its limits. It is 2,025 miles from New York; 1,457 miles from San Francisco; 639 miles west of Kansas City; 538 miles from Omaha; and is the chief metropolis of the entire Rocky Mountain region between the Missouri River and the Pacific coast. Its area is 54 square miles and its population is about 175,000; is the principal smelting centre in the United States, and its prosperity reflects the growth of the entire State, which produced (1902) gold, \$28,762,036; silver, \$12,488,774; lead, \$7,770,196; copper, \$1,293,011; total, \$50,314,019. The taxable property in Denver amounts to \$133,686,076, and its net public debt \$4,052,199. Denver lies at an altitude of one mile above the sea. The site is about 10 miles east of the base of the foot-hills of the Rocky Mountains in the valley of the south fork of the Platte River, at its junction with Cherry Creek, a dry stream, which carries running water only at intervals.

The climate of Denver is one of the most delightful and remarkable in the country. The data for the years 1897 to 1901 from the United States Department of Agriculture gives the following information: "Discarding fractions of a degree, the mean annual temperature at Denver is 50°, as against 48° at Chicago, 49° at Boston, 55° at Washington, 56° at St. Louis, and 69° at Jacksonville. During the last 32 years, 100° or higher has been touched just 13 times in Denver—7 times in July and 6 in August. While these high temperatures were maintained only for a few minutes, readings in the 90's are common during every summer month. For July, the warmest month, the average temperature is 72°, and the average daily maximum, or afternoon reading, is 87°. Here, as elsewhere, over the greater part of the United States, the coldest month is January, with an average temperature of 29°. The annual precipitation, which includes rain, snow, sleet, and hail, is 14.00 inches. Chicago, 34.8; St. Louis, 41.1; Washington, 44.8; Boston, 45.0; and Jacksonville, 54.1. Of sunshine Denver has 69 per cent of the possible, as against 65 at St. Louis, 59 at Washington, 54 at Boston and 53 at Chicago. The average

relative humidity is slightly below 50 per cent. It is highest in February, 55 per cent, and lowest in June, which has an average of 46 per cent. Twice during my residence of 21 years in the State have we observed a humidity as low as one half of 1 per cent. The annual relative humidity at St. Louis is 70 per cent, Boston 72, Washington 73, Chicago 77, and Jacksonville 80, and for the warmer months—June, July, August, and September—at St. Louis 66 per cent, Chicago and Boston 74, Washington 76, and Jacksonville 82. It will be observed that in the Atlantic States the humidity during the warm months is greater than the annual, just the reverse of that which obtains at Denver. In brief, Denver summers are characterized by warm days and cool nights, the heat of the day not attended by the usual debilitating effects; the winters by an abundance of sunshine, and the general absence of snow and of severe and long continued cold."

The public utilities of Denver are modern in every particular. The street cars are operated by the overhead trolley system, cover some 150 miles of streets; carry each year over 50,000,000 passengers. Gas, electric light and electric power are furnished by the Denver Gas and Electric Company, and the Lacombe Electric Company. The Denver City Steam Company supplies many business buildings with steam-heat, and operates 10 miles of pipe line. Telephonic communication is had between Denver and 227 of the principal towns in Colorado, Wyoming, and New Mexico. Denver's supply of water is furnished by the Denver Union Water Company, which takes its water from the Platte River, Bear Creek, and Cherry Creek. The greater portion of the waters are taken during the non-irrigating season and stored in large and extensive reservoirs. The waters from these reservoirs percolate through natural filter beds of sand, before entering the city mains. Probably no city in the world possesses better drinking water. As a commercial city Denver is increasing in importance each year. In manufacturing it produced in 1890 some \$30,000,000 worth of products; in 1902 \$48,750,000 represents the value of goods made in this city. As Denver's trade territory increases in population, its jobbing trade also increases, and in round numbers the wholesalers of this city sold in 1902 approximately \$50,000,000 worth of goods. Denver's banking and financial institutions are strong. The five national banks of the city reported their deposits for 1902 as amounting to \$43,852,605.

No educational advantage is denied any pupil in Denver's free schools. They start with the children in the kindergarten and carry them through 12 grades ready to enter college, or with a fair education in all branches of study if school life is to end with the public school. Besides the regular grammar and high school studies, the children may have manual training, special training in cooking and sewing, modern and ancient languages, music and drawing, with special preparation for advanced work in technical schools. The school property is valued at about \$4,000,000; annually there is spent for maintaining the schools about \$800,000. In addition to the city library are a medical library, several thousand volumes, six law libraries, school libraries containing 60,000 volumes,

DENVER, COLORADO.

exclusive of text-books, and at the capitol building a State library numbering over 15,000 volumes.

Denver has 4 daily newspapers, 35 weekly papers, and a number of trade journals. The city has 12 parks, with a total area of 550 acres, the largest, the city park, contains 320 acres. Denver has 156 church buildings. The public works have kept pace with the advance in other directions. Extensive storm and sanitary sewer systems, carefully graded, curbed, and paved streets, uniform sidewalks of first-class material, and massive steel viaducts are some of the indications of the progress. In 1902 there were 62 miles of sidewalks laid and 45 miles of streets graded and rounded ready for paving or surfacing. The estimated cost of the improvements now under way in 1903 amounts to \$1,068,338.

Several great transportation companies centre in Denver, four of which continue across the continent and one, the Denver, Northwestern & Pacific Railroad, now in construction, will make the fifth. The Union Pacific Railway takes its passengers through Denver to the western coast by the way of Cheyenne and Ogden; the Burlington & Rock Island transfers its passengers to the Union Pacific, Rio Grande, or Santa Fé for continuance of the journey. The Santa Fé, whose main line extends south of Denver across the continent through New Mexico and Arizona, makes southern connection for Denver. The greatest transportation enterprise of recent years is the construction of the Denver, Northwestern & Pacific Railroad, which was completed in 1903. By this road the distance between Denver and Salt Lake is 100 miles shorter than by any other route.

AARON GOVE,
Superintendent of Schools.

Denver, University of, a coeducational institution, in Denver, Col.; founded in 1864 under the auspices of the Methodist Church. Until 1880 it was called Colorado Seminary. The university is now composed of seven colleges; nine of the departments are at University Park, a suburb of Denver, and three in the city. The Chamberlain Observatory, which owns a very large telescope, is at University Park. In 1902 there were connected with the university 133 professors and instructors and 1,167 students.

Deobund, *dē'* or *dā'ō-bünd*, or **Deoband**, India, city in the Saharunpur district, Northwest Provinces; an ancient place, with manufactures of fine cloth and a grain trade. It has many temples, and is much resorted to by pilgrims. Pop. 19,250.

Deodand, *dē'ō-dānd* (*Deo dandum*, a thing to be given or dedicated to God), an obsolete legal term for anything that had caused a person's death, all such chattels being, by the old rule of the common law of England, forfeited to the king, to be devoted by him to pious uses, though often finding way to his privy purse. In all indictments for homicide, the grand-jury specified the instrument that immediately caused the death, and its value, that the king might claim the deodand and distribute it "to appease God's wrath." Though these forfeitures were originally incurred to the king, yet they were frequently granted to the lord of the manor or territory upon which the death

happened. Deodands were abolished in 1846. There has never been anything analogous to this custom in the United States.

Deodar, *dē-ō-dār'* ("divine tree"), from the Sanskrit *devadaru*, a tree (*Cedrus deodara*), a native of the mountains of India, where it grows to the height of 100 feet and upward. It chiefly resembles the cedar of Lebanon in habit of growth, and is probably a species of the same genus. The timber is among the most valuable grown in India. The name is rather freely applied to trees, especially to species of the *Conifera*. See CEDAR.

Deodorizer, a substance used for absorbing foul-smelling gases, or for substituting an odor which is pleasing for one that is disagreeable. Deodorizers are not disinfectants or antiseptics, and should not be confounded with them. They are of no use save to cover up disagreeable smells, and often do a great deal of harm by shutting people's nostrils to real signs of danger.

De Officiis, *dē o-fish'i-is* (Lat. "of duties"), a treatise in three books by Cicero, on moral obligations written about 44 B.C.

Deogarh, *dē'* or *dā'ō-gūr*, India, the name of several cities, of which the following two are the chief: 1. In Bengal, 170 miles northwest of Calcutta; it contains a group of temples to which numerous pilgrims resort. Pop. 8,667. 2. In Oodeypore, Rajputana; its chief attraction is an old palace. Pop. 7,400.

D'Eon de Beaumont. See EON D' BEAUMONT, CHARLES.

De Oratore, *dē or-a-tō'rē* (Lat. "of the orator"), a rhetorical work by Cicero, in three books, written about 55 B.C. It is in the form of a dialogue, the principal characters being L. Crassus and M. Antoninus. This work ranks with the most finished productions of Cicero on account of its varied contents and its excellent style.

Department, the name given certain territorial divisions of countries, especially to the principal territorial divisions of France. At the time of the French Revolution, when the former division of the kingdom into provinces was abolished, and succeeded by a division of it into departments, this division was determined partly by the number of inhabitants, partly by extent of territory, and partly by the amount of direct taxes. The new division was proposed in the Constituent Assembly in 1789, and effected in 1790. The whole kingdom was at first divided into 83 departments, which were subsequently increased by the gradual extension of the empire to 130, and were reduced by the Peace of 1814 to 86. By the cession of Savoy and Nice to France in 1860 the number of the French departments was increased to 89, and by the cession of Alsace-Lorraine to Germany in 1871, the number was reduced to 87. Most of the states of South America are also divided into departments (*departimientos*), but these resemble the French ones in nothing but the name. Each French department is subdivided into *arrondissements*, these again into cantons, and these again into communes. The name is, also, applied to military divisions, and to various other divisions as of government and schools.

DE PAUW — DEPILATORIES

De Pauw, Washington Charles, American manufacturer: b. Salem, Ind., 4 Jan. 1822; d. New Albany, Ind., 5 May 1887. He received a liberal education; worked himself up to the foremost rank among the business men of his State; and was successively a mill-owner, a merchant, and a banker. He was noted for his extensive gifts in behalf of education. His aid to the Indiana Asbury University set it upon a sound basis, and its name was changed to De Pauw University in his honor. He also founded De Pauw College for Women, and several charitable institutions at New Albany, Ind. See DE PAUW UNIVERSITY.

De Pauw University, a coeducational institution in Greencastle, Ind.; founded in 1837, under the auspices of the Methodist Episcopal Church, and known as the Indiana Asbury University until 1884, when the name was changed to De Pauw University. In 1902 there were in attendance 515 students with 29 professors and instructors; number of volumes in library 17,500; grounds and buildings valued at \$300,000; productive funds, \$290,000; benefactions, \$7,500; income, \$28,500; number of graduates, 2,110; president, H. A. Gobin, D.D.

De Pere, dé-pêr' or dê-pâr', Wis., city in Brown County; on the Fox River at the head of steamer navigation, and on the Chicago & Northwestern, and the Chicago, Milwaukee & St. Paul railroads, about 100 miles north of Milwaukee. Pop. (1900) 4,038.

Depew, Chauncey Mitchell, American lawyer, legislator, politician, and orator: b. Peekskill, N. Y., 23 April 1834. He was graduated from Yale College in 1856, studied law in Peekskill and in New York, and was admitted to the bar in 1858. He was soon after elected to the New York Assembly, and served as chairman of the committee on ways and means. For a time he was acting speaker of the house. In 1863 he was nominated upon the Republican ticket for secretary of state, and was elected by over 30,000 majority. In 1865 he declined a renomination. President Grant tendered him the Japanese mission about this time, but Dr. Depew declined the office, to enter the service of the New York & Harlem Railroad, as attorney. In 1869, when the consolidation occurred of the Hudson River, Harlem and New York Central R.R.'s he was made a director and attorney for the newly organized company.

In 1872 he accepted the nomination for lieutenant-governor on the Republican State ticket, but was defeated by a small plurality. In 1875, he became general counsel for the entire Vanderbilt system of railroads, and in 1882, second vice-president of the reorganized New York Central & Hudson River Railroad, and president in 1885. The same year Yale College conferred upon him the title of LL.D. During this period he was acting as a regent of the State University. He remained president of the New York Central until 1898, when he became chairman of the board of directors of the Vanderbilt system, which included the New York Central & Hudson River; Lake Shore & Michigan Southern; Michigan Central, and the New York, Chicago & St. Louis railroads.

His political career during these later years was eventful. In 1885 he declined the election to the United States Senate. In 1888 he figured

prominently as a candidate for the presidential nomination at the National Republican Convention, withdrawing from the contest in favor of Benjamin Harrison of Indiana, who, after his election and elevation to the presidency, tendered to Mr. Depew the portfolio of secretary of state, which was declined owing to large railroad interests. In 1899, on 17 Jan., he was elected to the United States Senate as junior member from New York State. Since 1885 Dr. Depew has been regarded as one of the leading Republicans of the country. Dr. Depew was married in 1871 to Elise Hegeman, who died 1893, leaving one son. He was married again in 1902 to Miss Palmer.

Dr. Depew's fame abroad is even greater than in the United States. In London and Paris he is regarded as America's representative citizen, and is interviewed and dined accordingly when he makes his annual summer pilgrimage to Europe. This world-wide fame rests largely upon his ability as orator, after-dinner speaker, and lecturer. He delivered important addresses at the Washington Centennial at New York in 1889, and the dedication of the World's Columbian Exposition, at Chicago, in 1893, and orations at the memorial services of President Garfield and General Sherman. As a wit and humorist, Dr. Depew has acquired a name second to none in this country, and he has been in great demand for many years at annual dinners and banquets, as the chief after-dinner speaker. He has published collections of his orations and after-dinner speeches in one volume (1890), and his later speeches (1894). Consult: Clemens, 'Depew Story Book' (1898).

De Peyster, dè pîs'tér, Abraham, American merchant: b. New York 8 July 1658; d. there 10 Aug. 1728. He was the eldest son of Johannes DePeyster (q.v.); and filled many important public offices after the final cession of the New Netherlands to Great Britain. Between 1691 and 1695, he was mayor of New York, and subsequently became chief justice of the province, and president of the king's council, in which latter capacity in 1701 he acted as colonial governor. He was also colonel of the forces of New York, and treasurer of the provinces of New York and New Jersey.

De Peyster, Arent Schuyler, British military officer: b. New York 27 June 1736; d. Dumfries, Scotland, November 1832. He was a grandson of Abraham DePeyster (q.v.). In the American Revolution he was a colonel in the Royal army; was at different times in command of the British posts of Detroit, Mackinac, and elsewhere in Canada.

De Peyster, Johannes, American colonial merchant: b. Harlem, Holland, 1600; d. New York about 1685. He was one of the early settlers of New York; and became prominent in public affairs during the Dutch possession; was one of the last to swear allegiance to the Crown after the English succeeded to the government; served several times as alderman and deputy mayor, and was frequently urged to become mayor by the English residents, but declined from ignorance of the language.

Depil'atories ("I pull out the hair"), applications used to remove the hair from the body, especially the face and scalp, without injuring the texture of the skin. Quicklime and or-

piment are the most common ingredients. The most celebrated depilatory is the *rusma*, used by Oriental nations, which consists of quicklime and orpiment (tersulphuret of arsenic) boiled in water impregnated with a strong alkaline lye. The parts which are to be deprived of hair are rubbed with this mixture, and after a time washed in warm water. This depilatory acts with great energy, and the utmost care is necessary in using it that it may not irritate and injure the skin. Sometimes a plaster of pitch and rosin is used for the same purpose. The best and most effective means of removing the hair to-day is by means of a galvanic current, and needle electrode, which is applied directly to the hair-follicle, thus killing it. This procedure is sometimes called electrolysis.

Depo'nent, (1) in grammar, a verb which is passive in the conjugation of its tenses, but is not construed according to the usual passive English form. The old grammatic fiction was that such a verb laid aside (*deponens*, laying aside) its passive meaning, but, though somewhat convenient as an aid to classification, this explanation of the form is logically and philologically unsound. (2) In law, a person who depones or makes a deposition; one who gives his testimony in a court of justice; a witness upon oath. See DEPOSITION.

Deposing Power of the Popes, their power, on whatever ground based, to depose sovereigns from their thrones and to annul their subjects' obligation of allegiance. It was the universal belief of the Christian world in the Middle Ages, that if a Christian prince fell into heresy and persisted therein against the admonitions of the Church, the pope might lawfully excommunicate him and procure his deposition, invoking the aid of orthodox princes and of the offender's subjects in making the decree of deposition effective. Such was the consentient teaching of divines and canonists, of church councils and of popes, though not laid down with all the formalities requisite to make such papal supremacy an article of faith. Of course the sovereign against whom the decree was fulminated usually protested and denied the pope's right to depose, or at least denied the justice of the grounds on which the decree was based, still his resistance to the Pope was regarded as rebellion against the decision of the highest court of Christendom. The Lateran council of 1215 directs that if a sovereign persists after warning in letting heresy grow and spread in his dominions, the bishops of the realm should excommunicate him. If he heeds not that judgment, the Pope is to be advised of that fact to the end that he may "declare the vassals of that prince absolved from their allegiance, and invite Catholics to occupy the country." The proceeding was in entire accord with the law of nations as understood in those times; and emperors and kings were crowned and consecrated on the understanding that they held their scepters subject to just such conditions. As Fénelon says, "The Church neither deprived nor appointed lay rulers, but only replied, when the natives consulted it, explaining what concerned the conscience in regard to the political contact or the oath. This is not," he continues, "a juridical and civil, but only a directive and ordinative power." The most explicit assertion of the Pope's deposing power is seen in the celebrated constitu-

tion *Unam Sanctam* (1303) of Boniface VIII., who in substance teaches that "both swords, the spiritual and the material, are in the power of the Church, but the latter is to be wielded for the Church, the former by the Church: one by the hands of kings and magistrates, but at the pleasure and sufferance of the priest. One sword must be under the other, and the temporal authority must be subject to the spiritual power." But the claim is no longer made, and the papacy accepts the situation of the Church as it is now, without thought of striving for a return of the ancient order. In the words of Pope Pius IX., "No one now thinks any more of the right of deposing princes which the Holy See formerly exercised; and the supreme pontiff less than any one."

Depos'it, in geology, a layer of soft or hard matter formed by the settling down of mud, gravel, stones, detritus, organic remains, etc., which had been held in suspension in water. Marine deposits are those formed on sea bottoms; lacustrine, those formed at the bottoms of lakes; fluvial, those formed on river bottoms; and so on. In contradistinction to bed or layer, which is matter more evenly distributed during formation, a deposit is nearly always irregular in form. See GEOLOGY.

Deposit, a term of wide meaning in law, but especially applied to money paid as an earnest or security for the performance of a contract; also to money belonging to one person intrusted to the safe-keeping of another, to be kept without fee, and to be re-delivered on demand. When such a deposit is made to a bank or trading company, interest, according to agreement, is generally paid on it. The person who makes the deposit is called the depositor, and the person who receives the deposit is called the depositary. By the civil law, deposits are divided into two classes, necessary and voluntary. The first class is where the depositor is compelled by some sudden emergency, such as fire or shipwreck, to confide his property to some one, without having opportunity for choosing his depositary. The second class is where the deposit is made by the mutual consent of the parties. Besides such deposits of money received by banking or commercial companies with a view to employing it in their business, a merchant or commercial company frequently deposits with a bank documents, such as deeds or bonds, as security for the payment of a loan.

Depos'ition, in law, testimony given in court by a witness upon oath; also the written testimony of a witness by way of answer to interrogatories; or affidavit certified by a notary public. When a witness himself can be produced his deposition cannot be read in court.

Deposition of Metals. See ELECTROPLATING.

Depot, *dē'pō*, Fr. *dā-pō*, a French word in general use as a term for a place where goods are received and stored; hence, in military matters, a magazine where arms, ammunition, etc., are kept. The term is now usually applied to those companies of a regiment which remain at home when the rest are away on foreign service. In the United States it is the common term for a railway station.

Depres, or **Despres**, *dā-prā*, *Josquin*, *zhōskān dē-prā*, Dutch musician: b. Hainault about 1450; d. Conde, 27 Aug. 1521. He is reckoned

DEPRESSION — DE QUINCEY

the greatest of the early contrapuntists, but little is known of his personal history. He composed numerous celebrated masses and songs.

Depression, or Dip. See HORIZON.

Depretis, dā-prā'tēs, Augustin, Italian statesman: b. Mezzana-Corte-Bottaroni, near Stradella, 31 Jan. 1813; d. there 29 July 1887. He was identified with Italian politics from 1849, when he was made civil governor of Brescia, and in 1861 was sent to Sicily as pro-dictator for Garibaldi. He served in a number of the Italian ministries, beginning in 1862 as minister of public works under Rattazzi. Under Ricasoli in 1866-7 he was minister of marine, and afterward held the portfolio of finance. In 1876 he was called to form a ministry himself, and while acting as president of the council and minister of finance he instituted many reforms in the government. In 1879 he resigned, and Carlioli formed a government, but Depretis was again placed at the head of the council in 1885, and remained there until his death.

Deprivation, the removing of a clergyman from his benefice on account of heresy or misconduct. It entails, of course, loss of all emoluments, but not the loss of clerical character, except it be *deprivation ab officio*, or deprivation of order, which then becomes deposition or degradation. The lighter punishment, simply taking away a clergyman's living or preferment, is called *deprivation a beneficio*.

De Profundis, the 130th of the Psalms of David (129th in the Douay version); one of the seven psalms, expressive of sorrow for sin and desire for pardon, used in the liturgy of the Roman Catholic Church, and called the Penitential Psalms. The name *De Profundis* comes from the Latin version of the first words of the psalm, "Out of the depths." See PENITENTIAL PSALMS.

Deptford, dēt'fērd, England, a metropolitan and parliamentary borough of greater London, formerly a town in Kent and Surrey. In the reign of Henry VIII. a dockyard was established in this place, then known as Deptford Strond. It was in this dockyard that Peter the Great of Russia served as an apprentice and learned ship-building 1691. The London Cattle Market (area 30 acres) occupies the site of the old dockyard. The Royal Victoria Victualling Yard, the largest army and navy supply depot, is located here.

Deputies, Chamber of, the lower of the two legislative chambers or second house of national parliament in France, Italy, Spain, Portugal, and Rumania. The first French Chamber of Deputies was established under Louis XVII. in 1814. By enactments introduced in 1830, any citizen of 30 years and upward who paid direct contributions to the extent of 500 francs might be elected as a deputy. Originally the chamber was elected for five years, in 1824 it became septennial, and in 1830 it was again limited to five years. In France (1903) the chamber consisted of 591 members, elected for four years by universal suffrage. In Italy the members numbered 508; in Portugal 148; in Rumania 183. In Spain the deputies number one to every 50,000 inhabitants.

Deputy, a lieutenant or substitute who exercises power which properly belongs to another who has placed him in his stead. The ap-

pointment of a deputy does not free the principal from responsibility. A deputy must take an oath of office. His salary is paid by the government. If authorized for the time being to act with full power of his principal, he is called a general deputy, and may act in his own name. Otherwise when acting in a particular and limited matter he is only a special deputy.

De Puy, dē pū, Henry Walter, American miscellaneous writer: b. Pompey Hill, Onondaga County, N. Y., 1820; d. 2 Feb. 1876. He constantly contributed political articles to the press; wrote several popular poems, and was the author of 'Kossuth and his Generals,' with a brief history of Hungary (1851); 'Louis Napoleon and his Times,' with a memoir of the Bonaparte family (1853); 'Three Score Years and Beyond' (1873); etc.

De Puy, William Harrison, American Methodist clergyman: b. Penn Yan, N. Y., 31 Oct. 1821; d. Canaan, Conn., 4 Sept. 1901. He was the editor of the Methodist Year Book 1866-89, and was associate editor of the New York 'Christian Advocate' for 25 years. He published: 'Compendium of Useful Information' (1878); 'The People's Cyclopedia of Useful Knowledge' (1879); 'Home and Health and Home Economics' (1880); 'The People's Atlas' (1882); 'University of Literature' (1896).

De Quincey, Thomas, English essayist: b. Greenhay, near Manchester, 15 Aug. 1785; d. Edinburgh 8 Dec. 1859. He was a boy of remarkably quick and precocious abilities, and acquired such great proficiency in classical studies that the master of the school which he attended pointed him out on one occasion to a stranger with the remark, "That boy could harangue an Athenian mob better than you or I could address an English one." His father died in 1793 and young De Quincey was extremely urgent with his guardian to send him to the University of Oxford; and his importunities proving unsuccessful, he ran away from the Manchester grammar-school with 10 guineas and a volume of Euripides in his pocket. He directed his steps first to North Wales, and afterward wandered up to London, where he arrived in May 1800, in an absolutely destitute condition, with his store of money exhausted, and not a friend to whom he could apply. For 16 weeks he roamed through the streets of the metropolis, unprovided with food or shelter, except such as was furnished him by charitable persons. He was at last discovered by his family and sent to Worcester College, Oxford, where he remained till 1808. Having been afflicted with rheumatism in the autumn of 1804, he was induced to alleviate the pain by doses of opium, and a foundation was thus laid of a pernicious habit, which in his case, as in that of Coleridge, proved extremely deleterious both to physical and mental health. For the first 10 years, however, of his addiction to the practice, the evil results were not perceptible, and in the possession of a sufficient fortune, a genial circle of friends, and freedom from bodily ailments, he spent the life of a learned and speculative voluptuary. In 1804 he had first become acquainted with Charles Lamb, and in 1807 with Coleridge. In 1809 he took a lease of the cottage of Grasmere, Westmoreland; previously occupied by Wordsworth, and there, in that beautiful locality, in the

DERA — DERBY

neighborhood of Wordsworth, Southey, and other literary friends, he continued to reside for upward of 20 years. In 1813 a severe derangement of his stomach forced him to increase his doses of opium, which he now took regularly every day. In 1816 he married; and in 1821, making a strong effort to shake off his habitual indolence, he commenced his 'Confessions of an English Opium Eater,' which appeared in the London 'Magazine' for that year, and were published in a collected form in 1822. In 1843 he took up his abode at Lasswade, Mid-Lothian, and here he remained almost to the end of his life. The latest, most complete, and best edition of his works is that published 1889-90, under the editorship of Prof. David Masson, in 14 volumes. See Japp (H. A. Page) 'Life of De Quincey' (1890); Findley, 'Personal Recollections of De Quincey' (1885); Stephen, 'Hours in a Library.'

Dera, dēr'a (a word derived from the Arabic "der," a monastery), the name of several towns in British India, the two principal places so designated being Dera Ghazi Khan, capital city of a district of the same name in the province of Punjab, about four miles west from the Indus River, in lat. 30° 4' N., and lon. 70° 50' E. It is a British military station, is situated on the Sindh-sagar Railroad, and contains many stately religious buildings and mosques. Pop. 23,899; and Dera Ismail Khan, capital city of the government district of Deradshat, in the Punjab, about eight miles west from the Indus, in lat. 31° 50' N. and lon. 70° 59' E. It comprises an English and Indian city, in the former of which is a British garrison, two regiments of infantry, one of cavalry, and one battery of artillery. The Indian city is surrounded by a mud wall, and occupied by noble native families. It is a trade depot for Afghanistan. Pop. 21,573.

Dera Ghazi Khan, dēr'a gā-zē' kân, India, a district and a town in the Punjab, in the division of Derajat. The district lies entirely on the right bank of the Indus, and consists of a sandy strip of low land shut in between the Suleiman Hills and the river. The town lies about two miles from the Indus, has many striking mosques, town-hall, court-house, handsome bazaar, cantonments, etc. Pop. of the town 27,886.

Dera Ismail Khan, ēs-mā-ēl' kân, India, a district and a town in the Punjab, in the division of Derajat. The district lies north of that of Dera Ghazi Khan on both sides of the Indus, and is in great part barren and sandy. The town is situated four and one half miles west of the Indus, and is the administrative headquarters of the Derajat division as well as of the Dera Ismail Khan district. There are here various government offices, cantonments for troops, and an important station of the Church Missionary Society. It is a somewhat straggling town on a level plain. Pop. 26,884.

Derajat, dēr-a-jāt, a division or commissionership of India, forming a portion of the Punjab, and occupying part of the valley of the Indus. It comprises the districts of Dera Ghazi Khan, Dera Ismail Khan, Muzaffargarh, and Bannu. Much of it is sandy and uncultivated, but many parts are well cultivated, and irrigation is largely employed. The area under

cultivation is increasing rapidly. Area 22,315 square miles. Pop. 1,643,603.

Derbend, dēr-bënd, or **Derbent** ("gateway"), Russia, a port and capital of the district of Daghestan, on the western shore of the Caspian, 140 miles northwest of Baku. It is charmingly situated among vineyards and orchards and fields of maize and madder, on the declivity of a branch of the Caucasus, which here approaches very close to the water's edge. It is surrounded by ancient walls. The harbor is inaccessible to all but small vessels; but a considerable trade is done at the four large markets held here yearly. Silk and cotton fabrics, earthenware, and weapons are manufactured, and saffron is cultivated. It was long considered the key of Persia on the northwest side. It was captured by the Arabs in 728, by the Mongols in 1220, and frequently changed hands before it was formally incorporated with Russian Caucasia in 1813.

Derby, Earl of, a title conferred in 1485 on Thomas, second Lord Stanley, two months after Bosworth Field, where he and his family had greatly contributed to Richmond's victory. The Stanleys were descended from Adam de Aldithley, who attended William the Conqueror to England, and whose grandson, having married the heiress of Thomas Stanley, of Stafford, exchanged the Manor of Thalk in that county, which he had received as his wife's marriage-portion, for that of Stoneley, in the county of Derby, and afterward assumed the surname of Stanley. In 1405 Sir John Stanley, who had married the heiress of Lathom, obtained a grant of the Isle of Man, which he and his descendants ruled till 1733.

Derby, Edward Geoffrey Smith Stanley, 14TH EARL OF, English statesman: b. Knowsley Park, Lancashire, 29 March 1799; d. there 23 Oct. 1869. In 1820 he was returned to the House of Commons as member for Stockbridge, in Hampshire. His very first speech marked him out as a skilled debater, and he rapidly rose to distinction in the House. His views at first inclined him to side with the Whig party. In 1827 he joined Canning's ministry as under secretary for the colonies; and became chief secretary for Ireland and Lord Grey. The opposition, led by O'Connell in the House of Commons, was powerful and violent; but while he firmly resisted the extravagant demands of the opposition, and the agitation for the repeal of the union, he succeeded in passing a number of measures which tended to lessen the prevailing discontent. He improved the administration of justice, carried a bill establishing a system of national education, and afterward, as secretary of state for the colonies supported the bill for the reform of the Irish Church, by which two archbishoprics and 10 bishoprics were abolished. He also gave his warm support to the petitions which were presented to Parliament for the abolition of slavery in the British colonies, and was successful in passing the act for this purpose in 1833. He now joined the Tories; and accepted office under Sir Robert Peel, being again appointed colonial secretary. He distinguished himself by his wise administration of this department during the four following years. In 1851 and 1858 he was commanded by the queen to form a ministry, but on both occasions he had to contend against a majority

DERBY — DERBYSHIRE SPAR

in the House of Commons, and was able to maintain himself in office only for a short period. He was more successful in 1866, when, on the defeat of Lord John Russell's government on one of the chief clauses of their reform bill, he undertook to form a ministry. His administration on this occasion was signalized by the reform of the government in India, the successful conduct of the Abyssinian war, and the passing of the reform bill which introduced household suffrage as the qualification for the electoral franchise. Earl Derby joined to great ability as a statesman, and brilliant oratorical powers, a high degree of scholarly culture and literary ability. Among other works he published a successful translation of Homer's *Iliad* (1864). See Kebbel, 'English Statesmen Since the Peace of 1815: Derby' (1869); Saintsbury in Reid's 'Prime Ministers of Queen Victoria' (1892).

Derby, Edward Henry Smith Stanley, 15TH EARL OF: b. Knowsley, Lancashire, 21 July 1826; d. there 21 April 1893. He was educated at Rugby, and Trinity College, Cambridge. In 1852 he was under secretary of foreign affairs; afterward secretary of state for India. Under his superintendence the management of the British India empire was transferred from the East India Company to the government of Great Britain. In 1866 and also in 1874 he was secretary of state for foreign affairs. Lord Derby became a Liberal in 1879, and was secretary of state for the colonies under Mr. Gladstone from 1882 to 1885. He, however, took a stand against Irish Home Rule in 1886 and afterward ranked among Mr. Gladstone's opponents.

Derby, George Horatio, pen name "JOHN PHOENIX," American humorist: b. Dedham, Mass., 3 April 1823; d. New York 15 May 1861. He was graduated at West Point (1846), and served in the army during the Mexican war (1846-7). He wrote under the name "John Phoenix" a series of sketches and burlesques, entitled 'Phoenixiana' (1855); and 'The Squib-bob Papers' (1859).

Derby, Orville Adelbert, American geologist: b. Kelloggsville, N. Y., 23 July 1851. He graduated from Cornell University in 1870, made trips to Brazil in 1870 and 1871; and was instructor at Cornell in 1873-5. In 1875 he became a member of the Brazilian geological commission, and has since been engaged in geological work in Brazil, being at one time curator of the geological department of the National Museum, and holding the position of chief of the geographical and geological survey of São Paulo since 1886. He has published a number of valuable papers on the geology and geography of Brazil, and is considered one of the first authorities on the subject.

Derby, Conn., city in New Haven County, at the junction of the Naugatuck and Housatonic rivers, and on the New York, New Haven & Hartford Railroad; nine miles west of New Haven. In 1893 the towns of Birmingham and Derby were consolidated and incorporated as the city of Derby. It is a manufacturing city of much importance and has abundant water power from the two rivers. There are extensive manufactures of brass and iron goods, paper, pins, and spectacles, and at one time the old town had a large West India trade and noted

ship-building yards. A bridge across the Naugatuck River connects Derby with the thrifty manufacturing city of Ansonia. It has several parks, daily and weekly newspapers, a national bank, good public and private schools. Pop. 7,930.

Derby, England, a municipal and parliamentary borough, capital of Derbyshire, on the Derwent River, and the main line of the Midland Railroad, 115 miles north-northwest of London. It has some fine public buildings, among which are the churches of All Saints, St. Alkmund, and St. Werburgh, built before the time of Henry VIII.; St. Mary's (Roman Catholic) designed by Pugin. The Derby public school dates from the time of Queen Mary. There is also a very handsome free library and museum. The principal manufactures are silk, cotton, paper, articles in Derbyshire spar, castings, and porcelain, etc. Derby is one of the oldest towns in the kingdom, and is supposed to owe its origin to a Roman station, *Derventio*, situated at Little Chester, on the opposite side of the river. Under the Danes it took the name of *Deoraby*. Richardson, the novelist, was a native of the town. Pop. (1901) 105,785.

Derby Day, the great annual London holiday, on which "The Derby," one of the most popular of the English horse-races, is run. It always falls on a Wednesday, being the second day of the grand race meeting, which takes place in the week after Trinity Sunday. The race is run on Epsom Downs, an extensive plain in the neighborhood of London. This race was instituted by the Earl of Derby in 1780. The entry-money is now \$500, but under the new regulations introduced in 1890 the first prize is definitely fixed at \$25,000 with any surplus fees. The course over which the race is run is a mile and a half in length. Since the race was instituted the weights have been several times increased, until now the colts have to carry nine stone, and the fillies eight stone nine pounds. Derby day is now regarded, especially in London, as a great holiday, and vast multitudes flock from the city and its neighborhood to Epsom Downs. The grand inauguration racing day of the summer season at Washington Park, Chicago, is called the American Derby day.

Derbyshire, a county in England, in the interior; area 1,029 square miles. The county is noted more for its coal mining and manufacturing than for agriculture. Its beautiful scenery and the numerous mineral springs attract tourists and health seekers. Its chief minerals are coal, iron ore, lead, fluor or Derbyshire spar, sandstone, limestone, alabaster, marble, zinc, and elastic bitumen. Some of the industries of the county are the manufacture of iron, silk and cotton goods, calico prints, agricultural implements, paper, hats, porcelain, various kinds of cloth, and vases, urns, etc., from the Derbyshire spar. The coal mining is an important industry and to transport the coal several canals and railroads cross the county. The principal towns are Derby, Buxton, and Belper. Pop. 620,196.

Derbyshire Neck. See GOITRE.

Derbyshire Spar, also called fluorite, and fluor-spar; is abundant in Derbyshire, and also in Cornwall, England. In the north of England it is the gangue of the lead veins which intersect the coal formations in Northumber-

land, Cumberland, Durham, and Yorkshire. It is found of almost every variety of color. The "Blue John" of the Derbyshire miners is a crystalline fluorite in which are alternate bands of blue and pale yellow spar. It is made into ornamental articles such as vases. See FLUORITE.

Derceto, dĕr-sĕ'tō, the Greek name of a Syrian goddess, the principal female deity of the Philistines, widely worshipped at Ascalon. She was the female counterpart of Dagon (q.v.), terminating like him in a fish. She was a nature goddess presiding over the principle of generation and fertility.

Derecske, dĕ'rĕch-kĕ, Austria-Hungary, a market town in Hungary, in the county of Bihar. In the neighborhood are four lakes, from which, by evaporation, soda is obtained. Nearby is another lake, called Fingoto, celebrated from the earliest times for its baths. In the same locality pearls are found, which, though small, are equal in beauty to those of the East. Pop. 8,272.

Derelict, any property abandoned at sea. Especially a ship abandoned by her crew either by consent or by compulsion, stress of weather, or other unforeseen condition, and yet, to save the owner's rights, if any cat, dog, or other domestic animal be found on board alive, it is not forfeited. The owner may yet recover, on payment of salvage, within a year and a day—otherwise the whole may be taken.

De Reszke. See RESZKE.

Derg, Lough, lōh dĕrg. (1) An expansion of the Shannon River, between the provinces of Munster and Connaught, Ireland. (2) A lake in the southeast of the county of Donegal, province of Ulster, Ireland. Saint's Isle and Station Island are in this lake.

Derham, dĕr'am, William, English philosopher and divine: b. Stoughton, near Worcester, 26 Nov. 1657; d. Upminster, Essex, 5 April 1735. He became in 1685 vicar of Wargrave, in Berkshire, and in 1689 rector of Upminster in Essex, where he spent the remainder of his life. Though small in stature, distorted, and of ungainly appearance, he had a highly gifted mind, and not only possessed the universal esteem of his parishioners, but acquired considerable reputation in various departments of literature. His best known works are: 'Physico-Theology'; 'Astro-Theology'; and 'Christo-Theology.'

Dermat'itis, a name given to certain inflammations of the skin, characterized not so much according to form and arrangement of the pathological changes taking place in the skin, but rather from their cause. These causes may act from within or without. The characteristic change taking place is some form of erythema or redness, with the characteristic heat, redness, and swelling. Thus there are found dermatitis traumatica, or the dermatitis set up by mechanical injuries such as blows, pressure, friction, scratching; dermatitis calorica, such as is due to sunburn or frostbite; X-ray dermatitis, dermatitis venenata, due to animal, vegetable, or mineral poisons, such as mustard, turpentine, croton-oil, tartar emetic, poison ivy, nettle, aniline dyes, strong acids, strong alkalies, arnica, etc.; dermatitis medicamentosa, or drug eruptions, such as happen following the use of anti-febrin, antipyrin, belladonna, arsenic, bromides,

iodides, etc. There may be also dermatitis following vaccination or following poisoning in wounds. There are other forms too numerous to mention, but those given are the commonest.

Dermatol'ogy, (from Gr. *derma*, the skin), a science that treats of skin diseases. See SKIN.

Dermat'ophyte, a parasitic plant, a sort of fungus infesting the cuticle and epidermis of men and animals, and giving rise to various forms of skin disease. The commonly known species are *Achorion Schanleini* (favus); *Trichophyton tonsurans* (ringworm); and *Microsporon furfur* (dandruff, scurf).

Dermestes, dĕr-mĕs'tĕz, a genus of coleopterous insects, the type of the family *Dermestidae*. The larvæ of this genus are covered with slippery hairs. They devour dead bodies, skins, leather, and other animal substances. One species (*D. lardarius*) is known by the name of bacon-beetle, and is often found in ill-kept ham or pork shops. Many insects, the larvæ of which have similar habits to those of the true *Dermestes*, sometimes receive that name, although they really belong to the genera *Attagenus*, *Necrophorus*, etc.

Der'mot Mac Mur'ragh, Irish king: the last ruler of Leinster, before the sovereignty was assumed by Strongbow, in the reign of Henry II. of England. He became king of Leinster in 1140, and having carried off the wife of O'Ruarc, Prince of Leitrim, was attacked by the latter, and was driven from Ireland in 1167. He betook himself to Aquitaine, where he did homage to the English king, who granted him permission to enlist adventurers in England, to aid him in recovering his kingdom. He received the aid of Richard de Clare, Earl of Pembroke, usually called Strongbow, who married his daughter Eva in 1170. With his aid he proved victorious, but when he died in the same year his kingdom was assumed by his son-in-law.

Dernburg, Friedrich, frĕd'rĭh dĕrn'boorg, German journalist and descriptive writer: b. Mentz 3 Oct. 1833. After a university course he rapidly acquired eminence in journalism and politics, and was a well-known correspondent at the Chicago Columbian Exposition. 'From the White City' (1893), a series of World's Fair sketches; 'In the Bonds of Guilt' (1894); and 'The Over Proud' (1889), are typical specimens of his fact and fiction.

Derne, dĕrn, or **Derna**, Africa, a town of Tripoli, in Barca, on the north coast of Africa, in a fertile district. It was captured by the United States fleet in 1815 during the war against Tripoli. Pop. 6,000. See DERNE EXPEDITION.

Derne Expedition (Derna or Dern), an expedition undertaken during the first years of the 19th century by William Eaton, an American who had been United States consul to Tunis in 1799-1803. Eaton became indignant at the abject submission of Christendom, part from fear and part from greed, to the wretched Barbary pirates; he had raged at their insults year after year while he was consul at Tunis; and when Tripoli, in 1801, finally insisted on war despite all payments, eagerly seized the chance of ending its robberies once for all by making it a United States protectorate. About 1792

Hamet Caramanli or Caramelli, pasha of Tripoli, had been deposed by his brother Yusuf and fled to Tunis, where he was then living; and Eaton resolved to have the United States restore him on condition of peace and no tribute, and thus striking terror into the other piratical states. He borrowed \$22,000 for Hamet to equip a force, with which our navy was to co-operate; but the naval commanders' hands were tied by their instructions, and in 1803 Eaton's plain-spoken refusal to comply with the bey's extortions caused his peremptory dismissal as consul. He returned to the United States and urged Jefferson to make the country a United States protectorate, but the government could not give *carte blanche* for so daring a scheme to the fiery dreamer. At length, in March 1804, Eaton was sent to the Mediterranean as "naval agent" with Barron's squadron, but without authority or instructions. He cared for neither squadron nor authority if he could have help and be let alone. Meantime Hamet Caramanli had failed and fled to Egypt, where, when Eaton arrived at Cairo on 8 December (having heard at Malta, in September, of Hamet's fiasco), the viceroy was besieging him and a few followers at Minyeh on the Nile. Eaton rescued him at great pains and some peril, and brought him to Alexandria; made a pact with him and a plan of campaign with Barron; and collected an "army" of some 500 floaters,—the majority Arabs, some Tripolitan Kabyles, a hundred Alexandrian Christian Greeks and Americans, a most extraordinary rabble for a desperate military venture,—and started for a march of 600 miles across the Libyan Desert to Derne, the seaport capital of Barca, the most fertile province of Tripoli. They had no provisions but what they carried, and no water for days together; and more than once the Arabs with Hamet were on the point of deserting in a body or cutting Eaton's throat. His energy and moral force finally pulled the entire body through a six weeks' march to Bomba, just east of Derne, 17 April 1805; but no ships were in sight. The Arabs cursed him afresh as an infidel traitor, and resolved to break up next morning; Eaton and the Christians took post on a hill for the night and lit fires, and next morning the waiting fleet saw the smoke and came in. The Arabs rejoined them, and after restocking from the fleet, and resting a week, on the 25th, in co-operation with three cruisers, they assailed Derne, defended by earth-works and 800 men. On the 27th they carried it by storm, Eaton being shot through the wrist. A large force was sent from Tripoli to retake it; and on 13 May he repulsed it in a sharp engagement with the aid of the fleet's guns. Another month passed; Derne showed no enthusiasm over Hamet, one Oriental master being about the same as another; Eaton could not march on Tripoli, some 700 miles farther on, but the pasha's troops could not drive him from Derne. Suddenly the ground was cut from under his feet by Lear's astounding treaty with the pasha, defensible as a treaty, but in its terms most incomprehensible and indecent. Hamet's supporters were left to the pasha's vengeance, Hamet to European exile and a grudging pension, and Hamet's family in the possession of the pasha. As to Eaton, he was left to useless political agitation, idle energies, and drink. See BARBARY POWERS, UNITED STATES TREATIES AND WARS WITH THE.

Derosne, Charles, shārl dè-rōn, French chemist and inventor: b. Paris 1780; d. there September 1846. He devised a still for the rectification of alcohol so arranged that instead of the weaker aqueous spirit which distilled being completely condensed by cold water, it was condensed by water only a little under the boiling-point of the mixture, so that while the alcohol still remained as vapor, a large proportion of the watery vapor was condensed, and thus the distillate was made stronger. This apparatus is called by his name. His most important research was into the composition of opium, in the course of which he isolated a crystalline body, long distinguished as Derosne's salt. He himself did not determine its character, and it was not till some years later that it was distinguished as an alkaloid by Robiquet, and called by him narcotin, the name by which it is now known. He was the first to introduce animal charcoal for decolorizing syrup.

De Rosny, Léon, lā-ōn dè rō-nē, French Orientalist: b. Loos, France, 5 Aug. 1837. He became professor of Japanese at the Special School of Languages in 1868, and founder of the International Congress of Orientalists. Among his numerous works are: 'Asiatic Studies' (1864); 'The Origin of Language' (1869); 'Japanese Anthology' (1871); 'A Grammar of the Chinese Language' (London 1874); 'Japanese Religion' (1881); and various translations, pamphlets, and essays.

Déroulède, Paul, pol dā-roo-lād, French poet: b. Paris 2 Sept. 1846. His 'Soldier Songs' (1872) and 'Military Refrains' (1888) were immensely popular, and won him the presidency of the Patriotic League; an association intensely hostile to Germans, and whose agitation seemed likely to lead to a collision with Germany, wherefore the poet was prevailed on to retire from the presidency. He has written a drama on patriotism, 'The Hetman,' and the semi-religious drama, 'The Moabitess.'

Derrick. See HOISTING APPARATUS.

De Russy, René Edward, American military officer: b. in Haiti, W. I., 22 Feb. 1789; d. San Francisco 23 Nov. 1865. He was graduated at the United States Military Academy in 1812, serving with credit in the war with England. He subsequently supervised the construction of fortifications in New York harbor and the Gulf of Mexico. During the Civil War he was ordered to the Pacific coast, where he constructed defenses in San Francisco harbor.

Dervish, or Dervis (Per. "poor"), the name of a class of religious devotees of the Mohammedan faith, all leading a life of poverty, and generally practising mendicancy. The observance of strict forms, fasting, and acts of piety, give them a character of sanctity among the people. They live partly in monasteries, partly alone, and from their number the imams are generally chosen. Throughout Turkey they are freely received, even at the tables of persons of the highest rank. There are, throughout Asia, multitudes of these devotees, monastic and ascetic, not only among the Mohammedans, but also among the followers of Brahma. There are 32 religious orders now existing in the Turkish empire, many of which are scarcely known beyond its limits: but others, such as the Nakshbendies and Mevlevies, are common in

Persia and India. All these communities are properly stationary, though some of them send out a portion of their members to collect alms. The regularly itinerant dervishes in Turkey are all foreigners or outcasts, expelled from their orders for misconduct. All these orders, except the Nakhshbandies, are considered as living in seclusion from the world; but that order is entirely composed of persons who, without quitting the world, bind themselves to a strict observance of certain forms of devotion, and meet once a week to perform them together. Each order has its peculiar statutes, exercises, and habits.

The numerous orders of dervishes are all divided into two great classes, the dancing and the howling dervishes. The former are the Mevlevies, and are held in much higher estimation than the other class. They are the wealthiest of all the religious bodies of the Turkish empire. The dancing of these dervishes is conducted to sounds of music. The movement at first is slow, but as the dervishes become excited it grows in animation, until at last the actors are exhausted, and are obliged to sit down. After a while they rise up again and resume their dancing, which is repeated several times. The whole is concluded by a sermon. The howling dervishes accompany their dancing with loud vociferations of the name of Allah, and violent contortions of the body such as are seen in persons seized with epileptic fits. In former times these dervishes, after working themselves up into a frenzy, used to cut and torture themselves in various ways with apparent delight. The sheiks of all orders have the credit of possessing miraculous powers. The interpretation of dreams, the cure of diseases, and the removal of barrenness, are the gifts for which the dervishes are most in repute. See **FAKIR**.

Derwent, *dër'wënt*, (1) the name of four rivers in England, in Derbyshire, Yorkshire, Durham, and Cumberland respectively. The Yorkshire Derwent is a tributary of the Ouse. (2) A river in Tasmania. It expands into an estuary where it enters the South Pacific Ocean. A lighthouse, elevated 70 feet above the sea, has been erected on Iron Pot Island, at the entrance of the Derwent, exhibiting a fixed light, visible at from 12 to 15 miles' distance. On the Derwent estuary is the town of Hobart.

Der'wentwater, **James Ratcliffe**, **EARL OF**, English nobleman: b. London 28 June 1689; d. London 24 Feb. 1716. His grandfather had been created Earl of Derwentwater by James II., and his father, Francis, married a natural daughter of Charles II. He succeeded to the title in 1705 and entertained a personal attachment toward the Stuart family, which induced him to take part in the attempt to restore them to the English throne. The standard of revolt having been raised in Scotland, Lord Derwentwater commenced the movement in England on 6 Oct. 1715. The cause of the Pretender was a losing one from the first, and in spite of the energy and courage displayed by the Earl of Derwentwater and other Jacobite nobles, they were compelled to surrender at discretion at Preston on 13 Nov. 1715. The Earl of Derwentwater, being impeached for high treason, pleaded guilty, and was beheaded on Tower Hill. His estates were confiscated and given to Greenwich Hospital.

Derwentwater, or **Keswick Lake**, a beautiful lake in Cumberland, England, in the vale of Keswick. It is about three miles in length and one and a half in breadth, and stretches from Skiddaw on the north to the hills of Borrowdale. Near the northeast corner is the celebrated cascade of Lodore. Its waters are carried to the sea by the Derwent.

Derzhavin, *dyër-zhă'vën*, **Gab'riel Roma'novitch**, Russian lyric poet: b. Kasan 14 July 1743; d. Novgorod 6 July 1816. In 1793 he was called to the senate, in 1800 was master of the imperial treasury, and in 1802 was minister of justice. The year following he was permitted to retire on full pay. His poetic talent had become early developed, and he is generally allowed to hold the first place among the poets who appeared during the reign of Catharine. He was an enthusiastic admirer of this empress, and has celebrated her in his most brilliant odes. Of these, however, at once the most beautiful and the best-known is his 'Oda Bog,' or 'Address to the Deity,' which, for sublimity both of thought and expression, has seldom been surpassed, and has been translated into most European languages. Almost all his poems are rich in true poetic beauties, though occasionally he indulges too much in gaudy Oriental metaphor. His works, containing, in addition to the Odes, several dramatic pieces and prose writings, were published at St. Petersburg 1810-15.

Desaguadero, *dă-să-gwă-thă'rō*, a valley in Bolivia and Peru, between two ridges of the Andes into which the great chain divides, near the city of Potosi. This valley or table-land is about 400 miles in length, and varies from 30 to 80 miles in breadth; area 150,000 square miles, and includes Lake Titicaca, and the smaller lake Aullagas or Uros. Desaguadero signifies in Spanish "a channel."

Desaguadero River, Bolivia, (1) the outlet for the waters of Lake Titicaca. It is 280 miles in length, running from Lake Titicaca southward to Lake Poopó or Agullas, in the département of Oruro. The lake last mentioned is without any known outlet. For many years traffic on this river has been hampered, the Lake Titicaca steamers running only as far as the town of Desaguadero (the head of navigation, pending improvements, for boats of considerable size), while beyond that town smaller steamers, engaged in carrying the silver and tin ores of Oruro and the copper of Corocoro, descended to a point 40 miles farther down the stream. A concession for canalizing the Desaguadero so as to extend navigation about 200 miles farther south was granted by the Bolivian government to a Peruvian corporation in 1892. Moreover a railroad from the northern shore of Lake Titicaca to Cuzco was projected, and has been partly built. These works, when completed, will form a system of land and water transportation unique in all the world; approximately 500 miles in length, and at an altitude ranging between 11,000 and 13,000 feet above the level of the sea, connecting the historic Cuzco (the ancient Inca capital) and the extensive silver and lead districts of Totalaya on the north, with the mines of Corocoro and Oruro. (2) A river called Desaguadero is in Argentina, and flows into Lake Bevedero Grande and separates the provinces of San Juan and Mendoza.

DESAIX DE VEYGOUX — DESCARTES

Desaix de Veygoux, Louis Charles Antoine, loo-ē shārl ān twān dē-sā dē vā-goo, French general: b. St. Hilaire-d'Ayat, Auvergne, 17 Aug. 1768; d. Marengo 14 June 1800. Entering the army at 15, in 1796 he covered himself with glory by his heroic conduct in Moreau's famous retreat through the Black Forest. Behind the ruinous fortress of Kehl, Desaix resisted the Austrian army for more than two months, only capitulating in January 1797, when his ammunition was spent. His greatest achievement was the conquest of Upper Egypt, accomplished in 1799, after an eight months' campaign. His own soldiers used to compare him to Bayard, while the inhabitants named him "the Just Sultan." Desaix returned from Egypt just in time to take part in the battle of Marengo, in which he was killed.

Desātir, the name given to a collection of sacred books, purporting to be the work of the 15 old Persian prophets, together with a book of Zoroaster. The collection is written in a language no longer spoken and equally different from the Zend, the Pehlvi, and modern Persian. The last of the 15 prophets, Sasan, who lived at the time of the downfall of the Sassanides, literally translated the Desātir, and accompanied it with commentaries. This work was until the 17th century one of the chief sources of the ancient Persian religious doctrines, interwoven with astrology and demonology; and, after having been forgotten for about a century and a half, was discovered at Ispahan and published at Bombay in 1818. Erskine added an English translation, but considered the collection as spurious; and Sylvester de Sacy believed it the work of a Parsee in the 4th century of the Hēgira, who invented the language. By some, however, it is considered as genuine. No trace of any connection with the Zendavesta and the magic of the Parsees has been found in the Desātir.

Désaugiers, Marc Antoine Madeleine, mārċ ān-twān mād-lēn dā-zo-zhē-ā, French song writer and dramatist: b. Frèjus 17 Nov. 1772; d. Paris 9 Aug. 1827. His life till 1797 was full of adventure; he was at one time a prisoner of the revolted blacks in San Domingo and in momentary fear of death. Going on the stage in Paris in 1805, his parody of the opera 'Danaïds' ('The Little Danaïds') was acted for 300 consecutive nights. His vaudevilles were remarkably successful. As a light song writer he is second only, if indeed second, to Béranger. Many of his songs will live long; such as 'The Consolations of Old Age,' 'The Picture of New Year's,' 'The Market'; 'Sunday Pleasures'; 'The Palais Royal.'

Desault, Pierre Joseph, pē-ār zhō-zēf dē-zō, French surgeon: b. Magny-Vernais 6 Feb. 1744; d. Paris 1 June 1795. He went to Paris in 1764, and was one of the numerous scholars of the celebrated Petit. He soon became celebrated by introducing a new method of teaching anatomy. While lecturing on the parts of the human body, he treated of the diseases incident to each. After having been several years principal surgeon of the hospital De la Charité, where he increased his reputation by introducing new methods of treatment, or by improving and simplifying those already in use, he was put at the head of the great Hôtel-Dieu, in Paris, in 1788. Here he founded a surgical school, in

which have been educated many of the most eminent surgeons of Europe. His principal merits were, that he brought accuracy and method into the study of surgery; improved the treatment of fractured bones, by adopting improved bandages; first introduced into France the clinical method of instruction in surgery; and infused into his scholars a generous attachment for their profession. He was distinguished for the skill and boldness with which he performed operations. Desault wrote only two small treatises; but the 'Journal de Chirurgie,' in which his scholars published his lectures delivered in the Hôtel Dieu, and the 'Œuvres Chirurgicales,' edited by Bichat under Desault's name, contain his whole system.

Desbarres, dā-bār', Joseph Frederick Wallet, English military engineer: b. England 1722; d. Halifax, N. S., 24 Oct. 1824. In 1756 he sailed as lieutenant for America, where he raised, and for a time commanded, a corps of field artillery. In 1757 he gained a victory over the Indians who had captured Fort Schenectady; and at the siege of Quebec was aide-de-camp to Wolfe, who was mortally wounded while Desbarres was making a report. He conducted the subsequent engineering operations during the conquest of Canada, and was quartermaster-general in the expedition that retook Newfoundland (1762). He made a survey of the coast of Nova Scotia in 1763-73, and afterward prepared charts of the North American coast for Lord Howe. He was lieutenant-governor of Cape Breton (1784-1804), and of Prince Edward Island (1805-13).

Descartes, René, rē nā dā-kārt (Latinized Renatus Cartesius), French philosopher: b. La Haye, Touraine, 31 March 1596; d. Stockholm 11 Feb. 1650. He was educated in the Jesuits' school at La Flèche. Both his birth and inclination led him to embrace the military profession, and he served in Holland under Prince Maurice, and in Bavaria under the Duke of Bavaria, and was present at the battle of Prague in 1620. He left the army in 1621, and visited Moravia, Silesia, Poland, Pomerania, and the shores of the Baltic. After a variety of travels he remained in Holland, where he composed most of his writings from 1629 to 1649, drew about him many scholars, and was engaged in many learned controversies, especially with theologians.

His celebrated system abounds in singularities and originalities; but a spirit of independent thought prevails throughout it, and has contributed to excite the same spirit in others. It has done much to give to philosophical inquiries a new direction, and found many adherents, especially in England, France, and Germany. Descartes, seeing the errors and inconsistencies in which other philosophers had involved themselves, determined to build up a system anew for himself, divesting himself first of all the beliefs he had acquired by education or otherwise, and resolving to accept as true only what could stand the test of reason. Proceeding in this way he found that there was one thing that he could not doubt or divest himself of—the belief of, and that was the existence of himself as a thinking being, and this ultimate certainty he expressed in the celebrated phrase "*Cogito, ergo sum*" (I think, therefore I am). Here, then, he believed he had found the test of truth.

DESCARTES' RULE OF SIGNS — DESCENT IN LAW

Whatever he saw to be true with as much certainty as he felt the certainty of his own existence was to be accepted as worthy of belief, and whatever could not stand that test was to be rejected.

Starting then from the indubitable reality of a thinking being, Descartes further says that this thinking being, that is to say, the soul, evidently differs from the body, whose existence consists in space or extension, by its simplicity and immateriality (whence, also, its immortality), and by the freedom that pertains to it. But every perception of the soul is not clear and distinct; it is in a great degree involved in doubt, and is so far an imperfect, finite being. This imperfection of its own leads it to the idea of an absolutely perfect being. (He therefore here makes use of the so-called ontological proof of the existence of God in a different manner from that in which Anselm of Canterbury had formerly employed the same; and hence the name of the "Cartesian proof.") He placed at the head of his system the idea of an absolutely perfect being, which he considers as an innate idea, and deduces from it all further knowledge of truth. The principal problems of metaphysics he conceived to be substantiality and causality. He contributed greatly to the advancement of mathematics and physics. He made use of the discoveries and observations of others, defining them accurately, and assigning them their place in his system. The higher departments of geometry (to which he successfully applied analysis), as well as optics, dioptrics, and mechanics, were greatly extended by him, their method simplified, and thereby the way prepared for the great discoveries made in the sciences by Newton and Leibnitz; for instance, he contributed much to define and illustrate the true law of refraction. His system of the universe attracted great attention in his time, but has been long since exploded. It rests on the strange hypothesis of the heavenly vortices, immense currents of ethereal matter, with which space is filled, and by which he accounted for the motion of the planets. He labored much to extend the Copernican system of astronomy.

Descartes loved independence; he nevertheless suffered himself to be persuaded to go to Stockholm, upon the invitation of Queen Christina, but died at that place four months after his arrival. His system is set forth in the treatise '*Discours de la méthode pour bien conduire sa raison et chercher la vérité dans les sciences*' (1637) with its appendices, '*La dioptrique*'; '*Les météores*'; and '*La géométrie*.' An edition of his works by Victor Cousin was published in 11 volumes (1824-6). A judicious selection from his philosophical writings, accompanied by an introduction, has been published by Jules Simon (1865). See Kuno Fischer, '*History of Modern Philosophy*'; Mahaffey, '*Descartes*' (1880); Fouille, '*Descartes*' (1893).

Descartes' Rule of Signs is a theorem by which the maximum number of positive or negative roots of an equation can at once be detected on sight. The theorem may be thus explicated: The number of positive roots of an equation cannot exceed the number of variations in the signs of its coefficients, considered in their proper order. A fair example is the cubic equation: $F(x) = 3x^3 - 7x^2 + 11x + 4 = 0$. Here are but two variations of signs on passing from one extreme term to the other, through the in-

termediate ones; we conclude therefore that the cubic can not have more than two positive roots. The maximum number of negative roots is seen on applying the same theorem to the equation which obtained from the original by changing x into $-x$. Thus the positive roots $F(-x) = -3x^3 - 7x^2 - 11x + 4 = 0$ are negative roots of the original cubic, and by Descartes' rule cannot exceed one.

Descendants, as a term of law, is applied to the issue of a person, or the offspring of such issue, to the farthest generation. Such descendants have a prior claim over collateral relatives or ascendants in the inheritance of property left by a deceased ancestor.

Descent in Law is the transmission of the real estate of a person dying intestate to his heir or heirs. The title acquired by the heir, in this manner, is called title by descent.

Prior to the Revolution, the law in England was that real estate could only descend and never ascend; but in the United States the law has been changed by statute, and at the present time real estate may ascend as well as descend; but, as far as the title is concerned, it is called title by descent.

According to the old English law, real estate descended to the oldest son who was living; provided that he had no elder brother who had died leaving a son to survive him; if all the sons had died without leaving issue, all of the daughters inherited together. There were exceptions to this rule, as in one part of England, the youngest child was the heir. Estates tail might also be called an exception, in some cases, as an estate tail female, where the daughter took the property; and if there were no daughters, the estate went to a person outside of that immediate family, the sons being excluded absolutely. In the United States, some of the States have passed laws by which any words used, in the granting of an estate, which would create an estate tail, shall be considered as creating an estate in fee simple, and by this means have abolished estates tail.

The rules of descent are applicable only to real estate, although sometimes they are incorrectly spoken of as applying to personal property also. Distribution is the proper word to use in speaking of personal property.

In some of the States, the laws of descent and distribution are practically the same; while in other States there is a great distinction between the laws of descent and those of distribution. The laws of descent and distribution are regulated by statutes in the different States, and may be changed at any time. Inasmuch as the laws of only a few of the States are the same and consequently a great many of them identically similar, it is necessary to examine the statutes of any particular State to find out what the law is in that particular State.

The general rule in the United States seems to be, that real estate descends to children, grandchildren and on down in the lineal line; in default of these heirs, then to parents, and, if they are dead, the estate goes to collaterals; and if there are no heirs to the State. The law of the place where the real estate is situated is the law according to which the estate passes to the heir; and it makes no difference where the decedent was domiciled.

DESCENT OF MAN—DESERT

Descent of Man and Selection in Relation to Sex, *The*, a work by Charles Darwin, published in 1871. The evidences of the descent of man from some earlier, less-developed form, collected and marshaled by Darwin, consist of minute inferential proofs of similarity of structure, at certain stages of development, between man and the lower animals. This similarity is especially marked in the embryonic stages; and taken with the existence in man of various rudimentary organs, seems to imply that he and the lower animals come from a common ancestor. Darwin reasons that the early ancestors of man must have been more or less monkey-like animals of the great anthropoid group, and related to the progenitors of the orang-outang, the chimpanzee, and the gorilla, and that still remoter ancestors must have been aquatic. The 'Descent of Man' was received with enthusiasm by scientific men, and its influence was much greater than that of the 'Origin of Species.' It had an effect not merely on physical and biological science, but on ethical and religious conceptions. In the volumes containing the 'Descent of Man' Darwin placed his elaborate treatise on sexual selection, which may be regarded as a part of the theory of man's descent. See DARWINIAN THEORY.

Deschamps, Eustache, ès-tāsh dā-shān, called MOREL, French poet: b. Vertus, Marne, about 1330; d. after 1475. He composed a multitude of short poems of a political or moral nature. The 'Mirror of Marriage' comprises 13,000 lines. He wrote an 'Art of Poetizing,' the earliest work of its kind.

Descroizilles, François Antoine Henri, frān-swā ān-twān ōn-rē dā-krwā-zēl, French chemist: b. Dieppe, 11 June 1751; d. Paris, 14 April 1825. He studied chemistry at Paris under Rouelle, and thereafter became professor at Rouen. He especially devoted himself to the technical applications of the science. Berthollet had hardly discovered bleaching by chlorine, when Descroizilles tried it at his works at Lescure-lez-Rouen, and found that it succeeded. He collected the chlorine in water containing chalk, and thus made a step at a very early period in the direction of bleaching-powder. In the course of his operations he contrived different pieces of apparatus for the rapid valuation of commercial products. Thus his alkalimetre for the estimation of alkalies by Vauquelin's method, his apparatus for estimating vinegar (aceti-metre), and for bleaching liquid (Bertholli-metre), are among the earliest contributions to volumetric analysis. He also contrived a still for the estimation of alcohol in wine. He published a great many researches, especially on technical chemistry. He was the first to show that alum is a double salt.

Desdemo'na, the heroine of Shakespeare's tragedy 'Othello.' She is the daughter of a Venetian senator, Brabantio, and is drawn to love the Moor who visits her father, by hearing him relate the vicissitudes of his adventurous career. She marries him against her father's will and proves a devoted wife, but Othello, through the machinations of Iago, is led to doubt her fidelity, and, in a jealous rage, smothers her. Desdemo'na's character is marked by modesty, sweetness and innocent trustfulness. See OTHELLO.

Desecada, dēs-ē-ā-dā. See DÉSIRADE.

Deseret, dōz'ēr-ēt, the name first adopted by the Mormons for what is now Utah. See MORMONS; UTAH.

Deseronto, dōz-ēr-ōn'tō, Canada, a town in Hastings County, province of Quebec; on the Bay of Quinte, the Grand T. and the Canadian P. R.R.'s. It is about 132 miles west of Toronto. Its principal manufactures are lumber-mills, agricultural machinery, flour, and furniture. The gas used for illumination is made from the sawdust of the lumber-mills. Pop. 3,609.

Desert (literally, "a solitary place"), a term designating in its broadest application any uninhabited region, this being the sense in which it is frequently found in the Scriptures. In its more ordinary use the word means a portion of the earth's surface that on account of its barrenness cannot support inhabitants. Four classes of desert may be distinguished: (1) Ice-wastes occupy the central plateau of Greenland, the islands of the Arctic Sea, and probably the entire Antarctic continent. (2) Tundras (q.v.) are flat plains, little elevated above sea-level, fringing the Arctic shores of the northern continents, and especially characteristic of Siberia. (3) Temporary deserts, or steppe-lands, border the Asiatic deserts to the north and west. The saline steppes of the Caspian are true arid wastes; but the typical steppes in South Russia are luxuriantly clothed with verdure and flowers in spring. In the dry season they form a dusty plain of withered herbage. The llanos (q.v.) of the Orinoco have similar characteristics, but the pampas of South America include portions perennially green and suitable for agriculture. (4) Arid wastes, or deserts in the popular sense of the word, occur mainly in two zones encircling the world, and corresponding to regions of minimum rainfall. The greater zone extends from near the equator in an east-northeast direction across the whole breadth of North Africa, as the Great Sahara, Libyan and Nubian deserts, over the peninsula of Arabia, through Persia, Turkestan, and the vast tracts of Gobi or Shamo to the confines of China. The sandy zone, thus traced throughout the breadth of the ancient continent from western Africa to lon. 120° E., has been computed to cover an area of 6,500,000 square miles; but the Asiatic portion of this tract includes many chains of mountains, and fertile valleys. The great Indian Desert in the Punjab is the only extension of this belt south of the Himalayas. The ring is completed by the Great Basin of North America in lat. 40° N. The southern zone, less complete, comprises the Kalahari Desert in southwest Africa, the interior of Australia, and districts in Chile and in the Argentine Republic.

Deserts occur at all elevations, from considerable depths beneath sea-level to many thousand feet above it, and with all varieties of surface, from a flat expanse of sand, where the view for days of travel is bounded by a sharp circle as at sea, to rocky mountain slopes rent by rough defiles bare and chiseled by the driving sand. The essential character of an arid waste is its rainlessness, and the scarcity of water on the surface and of water vapor in the atmosphere. Radiation in the clear air is rapid and desert climate is consequently of an exaggerated continental type. The sand in the Sahara becomes heated to over 150° F. during the day, and

DESERT

chilled below the freezing point at night, while the diurnal and seasonal extremes in the lofty deserts of Central Asia are much greater. Thus desert-regions are most effective in producing land and sea breezes and monsoon winds in consequence of the marked periodical changes in atmospheric density. Another effect is the mirage (q.v.), a phenomenon which, combined with the great loneliness that oppresses the occasional traveler, probably accounts for the widespread superstitions peopling deserts, above all other places, with evil and malicious spirits. The dreaded sand-storm or simoom is a kind of tornado or whirlwind which raises the sand in tall rotating columns sweeping over the surface with tremendous velocity. Sand-dunes, sometimes several hundred feet in height, are raised by steady winds, and gradually shift their position. Desert vegetation is extremely scanty, consisting mainly of hard prickly plants of the cactus, euphorbia, and spinose kinds, whose surface exhales little moisture. Animal life is correspondingly restricted both in variety and number of individuals. The camel is *par excellence* the beast of burden for conducting traffic across arid wastes. When an overflowing river, such as the Nile, traverses a desert, the land becomes richly fertile in its immediate neighborhood, and wherever springs bubble up through the sand there are oases, bearing palm-trees and grass. Artificial irrigation, especially the sinking of artesian wells, has done much to reclaim tracts of desert for agriculture in the Sahara and to a less extent in Australia, while the area of arid land in the western part of the United States, once considered irreclaimable, is being rendered by irrigation increasingly productive.

Geological considerations show that arid deserts are not permanent features of the earth's surface. The most level expanses have once formed part of the ocean bed, or at least great inland seas. The orographical changes which cut off these seas and created inland drainage areas probably at the same time modified the rainfall of the locality. Excessive evaporation dried up the great lakes, leaving at present a series of diminishing salt lakes without outlet, receiving rivers which dwindle down by evaporation as they flow. The only commercial commodities yielded by deserts are the salts (common salt (borax, sodium carbonate, and sometimes sodium nitrate) left in the dried-up lake beds. These salt lakes are subject to alternate long periods of desiccation and flooding; during the former the area of the desert extends, during the latter it contracts. These periods have been traced out in the case of the Great American Basin by a series of most interesting researches on the part of the United States Geological Survey. See GOBI; SAHARA.

Desert, The Great American. The North American deserts possess all the physiographic, geologic and climatic elements which distinguish the African desert of Sahara. The chief difference between the two regions is the relatively larger area of the Sahara, the arrangement of the topographic units and the occurrence in the Great American Desert of a wealth of mineral resources which the Sahara does not possess. Through the application of modern mechanical agencies by American energies and brain, its wastes have become inhabited by an intelligent and progressive people, and its arid hills and

plains made to yield a wealth twice as much per capita as that of any other portion of the United States.

The North American Cordilleran region embraces the whole of our continent between the Great Plains and the Pacific north of the Isthmus of Tehuantepec. Of the grander scenery of the world none is more varied and beautiful than that of this region. From its northern end in far-away Alaska to the jump-off of the Mexican Plateau of the South it presents a marvelous panorama of form, color and sculpture. A few of these features are familiar by name, but the glories of the Cordilleras as a whole have not been written, for even the professional geographer has but an incomplete idea of the region as an entirety, or of its parts and their relations. In fact, much of the Cordilleran region is still so poorly mapped, that there is not yet a chart that gives a correct presentation of its great mountains and valleys. Most people, therefore, have but vague ideas of the Rocky Mountains, the Great Deserts, the western and eastern Sierra Madre, the California sierras, and the Coast ranges—any one of which is as extensive and unique a geographic unit as the great Appalachian region.

The Cordilleran region is likewise one of contrasting extremes. Within it are found every condition of climate, altitude, vegetation and productivity. The rainfall varies from the greatest in the United States (in Washington) to the least in the world (in the Death Valley and the Yuma Desert). Its altitudes range from the highest peaks on our continent (over 17,000 feet) to depressions 300 feet below sea-level. Its vegetation presents the contrast of forests of the largest and most beautiful trees in the world and vast stretches of desert plain with the feeblest mantle of struggling bush and thorn. The region is the motherland of our longest rivers, the Missouri, the Columbia, the Colorado and the Rio Grande; yet it has a million square miles without as much running surface water as the smallest New England township. It has in places mines which yield from a single acre more wealth than whole counties in many Eastern States, and it produces every mineral of the United States; yet again there are hundreds of miles of barren malpais as worthless as any ground the sun shines on. Some of its acres of agricultural soil are the most productive on earth, yielding under intensified and scientific culture the finest and most abundant crops of fruit, grain and tubers; and upon others even the cactus will not grow.

The forested Cordilleras occur in several distinct groups, which are so aligned as to constitute marginal chains of mountains bordering the Eastern and Pacific sides of the Cordilleran region, between which lie the deserts and plateaus. The chief of these groups are, (1) the Montana and Colorado groups of New Mexico, and the eastern Sierra Madre of Mexico, forming the eastern ranges of the Cordilleran region; and (2) the Sierra Nevada, Cascade and Coast ranges of the extreme western United States, and the western Sierra Madre of Mexico, constituting the Pacific or western ranges.

The remainder of the Cordilleran region, including the vast stretches lying between the Sierra Nevada of California and the eastern Cordilleran ranges (Rocky Mountains) in the United States, and between the Pacific Ocean

DESERT

and the eastern Sierra Madre of Mexico, constitutes the Great American Desert.

Of the total area of the Cordilleran province, three eighths are forested mountains, one eighth plateau, and one half waterless, treeless, turfless mountain and valley desert. The deserts occur in Nevada, Utah, eastern and southern California, Arizona, New Mexico, and all of Texas west of the Pecos, 550,000 square miles. The American Desert is international, however, for in addition to the above area within the United States, it continues southward into Mexico, where it includes most of the states of Sonora, Chihuahua, Coahuila, San Luis Potosi and Sinaloa—another 500,000 square miles—making a total of 1,050,000 square miles which, although one third the area, is as truly a desert in every natural sense as is the Sahara, which embraces an area of 3,500,000 square miles, and has a population of 2,500,000 people.

Through the area mentioned, the Great American Desert stretches southward far into the tropics, a marvelous country, unique in every feature of landscape and vegetation.

In its entirety (with a few exceptional forested summits) this desert province is one of barren, stony mountain ranges, separated by equally barren stretches of desert plain, an aggregation of elongated arid plains and lower mountain ranges, which mostly follow the axial line of the Cordilleras. The individual deserts have many names, and each differs from the others in some minor aspect.

From a technical point of view a desert in its ultimate analysis is a region in which the rainfall is insufficient to produce run-off. The light rainfall, striking the heated rock surfaces and sandy soils, is soon evaporated or drunk in; even the large bodies of water which may start down the mountain sides as roaring torrents usually die out at the margins of the plains. These waters are highly charged with mineral salts derived from the heated rock surfaces, and these salts are readily redeposited upon the surface or in the interstices of the permeable sands. The torrents locally transport the rock debris—boulders, pebbles, and powder—from one locality to another, but only for short distances; and hence the desert plains are usually composed of the debris of the adjacent mountains, which in more humid regions of ample run-off would have been carried to the sea. The expansion and contraction from the daily temperature causes the desert rocks to fracture *in situ* into the desert waste. This is distributed by wind and torrent, and hence the features of the desert are largely air-made as well as water-wrought.

The scarcity of moisture results in the absence of vegetation of the root-twining, soil-gathering, and soil-making type that distinguishes the humid region. Every plant and species attests the aridity of the country. Exactly as in the Sahara, these plants are thorny, coriaceous bushes and shrubs of the cactus, aloe, and acacia families, adapted to withstand their droughty environment, and to defend themselves from attack by man or beast.

Physiographically there are two sub-provinces of the Great American Desert, lying to the east and to the west of the western Sierra Madre and Colorado Plateau respectively. The westernmost of these may be termed the Nevadan and the eastern the Chihuahuan. The western,

or Nevadan, Desert occupies much of the area of Utah, Nevada, Mexico, southern and eastern California in the United States, and the states of Sonora and Sinaloa in Mexico. The Chihuahuan Desert occupies the vast area of country lying between the eastern and western Sierra Madre of Mexico and their northern continuation into southern New Mexico and Texas west of the Pecos, and is the so-called Mexican Plateau.

The Great Basin Desert is marked by wide flatness, and is largely a region of ancient lake beds. Its surfaces are in many instances what the geologists term constructional, and its flora is mostly sage brush and grease wood; its agricultural products cereals and tubers; and its minerals gold, silver, and copper. The Sonoran Desert is of a more complicated geological type, and instead of being land-locked is bordered on one side by the Pacific Ocean. Some of its surfaces are also the result of what geologists term destructional processes. Its floral types are the saguara, the palo verde, and the cat-claw. Its sparse agricultural products are fruit and wheat, its mineral resources gold and copper.

The Chihuahuan Desert, marked by parallel plains and ranges, is a relatively higher region; its features are a combination of destructional and constructional processes. Its floral types are the maguay cactus and yucca; its chief agricultural product maize (corn), and its principal mineral product silver.

While the desert plains may be extensive, they also have many phases of variation. There are the alkali plains, white crystal patches of saline efflorescence which vegetation abhors, and vast plains of "doby" (adobe)—brownish chocolate clay soils through which here and there are cut the deep channels of streamless streams. There are the dreary "tabosa" flats covered by headlike bunches of a woody grass, abhorred by animals and useless to man, through which one may travel for days. The great white gypsum desert of the Tularosa valley of New Mexico is one of the most wondrous of all the desert plains. To the eye it is a veritable sea of purest granular snow, marked with wind waves and ripples like the Tropic Ocean, with billows and troughs. Yet it is not snowlike in its torrid heat, which burns and thirsts more than man can tell. In some places there are extensive lakes of crystalline salt which the desert inhabitant uses for herd and flock. Sometimes there are stretches of dreary brown sand hills, great billows gathered around the protecting roots of the thorny mesquite, the particles blowing with each breath of wind, ever seeking a resting place, though seldom finding one.

The half cannot be told of the many other aberrant features of the Great American Desert, like Death Valley, with which no spot in Sahara can compare for sterility and desolation; the great "medanos" or white sand dunes just south of El Paso, each as high as the national capitol, which creep from place to place over the desert plain; the vast plains of malpais in New Mexico with their burning, cutting, black, waterless surfaces of lava; the "flour dust" deserts of Jimenez and Arizona and Sonora, where the traveler is choked with clouds of chalk-white powder; the Crow Flat with its glare that blinds, the Jornada del Muerto, with its hundred whirlwinds, the saguara deserts of Sonora, where

THE AMERICAN DESERT.

DESERT

for hundreds of miles grows no blade of grass, or many other spots which are apparently a mockery of nature.

The clouds are the most wonderful manifestations of the desert heavens. The forms of vaporous atmosphere are numerous. In the morning they fill the valleys with snow white vapor, which at midday rises and gathers into solitary fluffs sailing majestically along like great icebergs in a sea of azure ether, or again breaking into small bunches like flocks of sheep. Frequently from one little handful of cloud surrounded by golden sunshine, a ribboned spray of rainfall may be seen dropping upon some lonely spot. Toward night they gather in rolling banks and settle upon the mountain tops, rapturously lingering near the horizon, where they are painted by the setting sun in floods of glorious gold and violet.

Sometimes showers freshen the desert. These are occasionally of sufficient volume to dampen the earth and vegetation, and an awakening of life ensues which is most remarkable. From every shrub and cactus comes a burst of song from birds ordinarily unnoticed. Rabbits creep out and browse, coyotes give tongue in chase of prey. Vegetation seems to awaken instantaneously, plants which before were dry and dust-covered unfold into broad areas of vivid green. Coriaceous ferns, ordinarily lying like dead leaves among the stones, unroll and wave their fronds in the freshened air. From the inconspicuous flowers of the many thorny shrubs of the acacia and yucca tribe the air is laden with perfume.

It would seem paradoxical to speak of the desert in bloom, but the human senses of sight and smell can be regaled by no more pleasant experience than the delicate odors and sweeps of color that sometimes follow an unusual rainfall. Sweeter than the dewy jessamine is the scent of the yellow catsclaw; more delicate than mignonette is the panule of the mesquite.

Like a dainty pencil line drawn across the sheet of desert, the trails may be seen for miles and miles. These, originally made by the wild Comanche and Apache, lead in long tangents from water-hole to water-hole, cutting paths of deep-worn ruts. Were it not for these trails connecting the various water places the desert probably would be impassable, for the priceless water is usually concealed in spots where least suspected. These water-holes were discovered by the aborigines long before the ranchman and settler came or the army wagons and cavalry troops deepened the impress of the trails. What stories of death and pain, thirst and starvation could be told by these old trails! We know that as early as 1528 many of them existed, for in that year Cabeza de Vaca and his three shipwrecked survivors of the Navaez expedition followed these paths from water-hole to water-hole across our southern border, and that modern commerce and migration still use these, the oldest and most stable monuments of the desert.

In the desert water is king. Without its countenance priceless ore is but as dross, and fertile soils are as worthless ashes. Upon the desert plains many men and cattle have died for the want of a drink of water, which millions could not buy. Water is not only the king of the desert, but its despot. It smiles at the millions of acres of land owned by a certain uni-

versity as a part of its endowment which is still ungraced by its favor. It laughs at the waterless miles upon which the United States invites settlement under the homestead laws; it defies those who would take the rich gold from the placers of the deserts of Sonora and Arizona, where the gold would remain forever without its precious favor.

Like the Sahara, the Great American Desert is superficially waterless. Its plains are usually barren of surface water save for an exceptional saline lagoon. A few brooks, streams, or rivers arise within its larger mountain ranges, but no water ever runs off its surface to the sea. Even the great floods of water which sometimes burst from an erratic cloud with devastating effect are rapidly swallowed up by the sands or evaporated by sun and wind. It is true that there are two long rivers comparable to the Nile of the Sahara—the Colorado and the Rio Grande—which rise in the higher forested mountainous border lands and flow into and across the deserts like great canals, without gathering contributory drainage from them, losing volume in fact from absorption and evaporation in the desert portions of their courses. These are rivers born of the mountains, however, and not of the deserts.

Upon the area of the Great American Desert the maximum rainfall is less than 15 inches per annum, and does not average more than 10 inches. In places such as Death Valley and the Yuma Desert it is less than five inches, these two spots being perhaps the driest in the known world. Deducting from this maximum of 15 inches 60 per cent of its effectiveness, due to loss through evaporation, the actual rain value is only six inches per annum, less than the amount falling in the two crop-growing months of May and June in the eastern States, and less than one half the quantity that fell in September 1901 in a single 24 hours at Galveston, Texas. To this great natural fact the desert is resigned, that within its area the land with a few exceptions, not amounting to 3 per cent, is permanently and hopelessly dry, and even the most sanguine cannot refute this fact.

Before the railways came, the Great American Desert was a most primitive region. In 1880 it was inhabited by a population about as dense as that of the Sahara now, but practically in the same state of culture; and the mission bells rang over the same civilization that existed in 1528. The inhabitants practised irrigation, agriculture, and architecture very much like that of the Egyptians of to-day, and constructed dwellings of unburnt brick and stone. The aborigine found sustenance on the desert, but of a kind upon which the white man could not well exist. Maize was his staple of diet. This with the tunas (fruit of the prickly pear) and the roots of various yuccaceous plants, supplemented by a few wild animals, provided an aboriginal diet pure and simple.

It was no great feat for the Spaniard who already possessed an Old-World knowledge of desert craft to amalgamate with the aborigines. He gave to them a few domestic animals (the goat and the burro, which can live where other animals starve). He also gave to them the Catholic religion and the Spanish language. For nearly 400 years the desert population made no progress in industrial civilization beyond adopt-

DESERT

ing the wooden plow and the cumbersome wheeled cart known as the *carretta*.

In Mexico the old desert cities and country estates were practically in the same status of civilization that existed in the 1st century after discovery. The cities had no commerce except by caravan; the estates were great feudal districts with their fortified *haciendas*, to which all the surrounding people were attached as fiefs. For 200 miles along either side of the international border in Mexico and our own desert country the unconquered Apache spread devastation from the Pecos to the Colorado; and the only white men there were the soldiers at scattered and lonely outposts, or "bad men" endeavoring to hide from civilization, and hardly better than the Apaches in instincts or action. Here and there in the United States at the widely dispersed water-holes were a few nomadic ranchmen who owned cattle of primitive breed for which there were no purchasers, except the army and beef contractors. Some mines there were also, but these were merely those with easily reducible ores and limited in depth by the distance which a man could dig in solid rock without machines or powder, and from which burdens could be carried on the human back. In Utah alone had the white man attained a foothold, but the Mormons were men who sought the desert to escape civilization, with the ambition of reverting to a culture as purely barbaric as that of Abraham and his descendants who now live in the Sahara.

With the advent of the railroads the modern conquest of the desert began. It was first awakened from its centuries of lethargy by the whistle of the locomotive in the eighties. In the Great American Desert in the United States and Mexico there are now more than 9,000 miles of railway. But for the railroad the Great American Desert would to-day be as unproductive as the Sahara, and still populated, like the Sahara, by people who exist without division of labor, the use of mechanical appliances or extra-territorial commerce. The first railways to be constructed were designed merely as highways between the Atlantic and Pacific seaboard. No thought of revenue from the desert itself was anticipated. Next came a great longitudinal line following the ancient trails of the Aztec from Mexico to Santa Fé. Mining and population soon followed these trunk lines, which are now extending out even into the utmost recesses of the desert, and these feeders—built or in process of construction—will soon equal the aggregate of mileage of the original trunk lines. From the Pecos in Texas to California, a distance of 1,500 miles, the route of the Southern Pacific followed a belt of country devoid of water except occasionally in the Rio Grande. Not a herd of cattle, a modern house, a farm or a mine existed along this desert stretch. Nor would they exist to-day had it not been for the construction of this railway. Now its course is marked by many prosperous embryo cities and villages.

Notwithstanding the apparent scarcity of water, one of the most remarkable features of the American Desert is that water has been secured, often in apparently impossible places, and in quantities which have made possible the existence of cities and industries. Like the deserts of the Sahara and Asia, those of America have a supply of underground water; there is

hardly a desert in which the experiment has been tried where waters have not been found within 2,000 feet of the surface. Though not often sufficient for agriculture, enough has usually been found to afford a supply for cattle, railroads, and mines.

Underground water has usually first been found by the railway companies. When the track was first pushed across the desert water was brought from the rear in tank cars; but when the track was completed water was bored for in the desert itself. The engineers have had at command a mechanical appliance second only in importance to the locomotive, and one which in the desert usually goes side by side with it. This is the mechanical drill. At great expense they bored in many places. The existence of underground water beneath any particular area having once been demonstrated by the railroad company, individuals, of course, usually repeated the experiment. Three notable triumphs of the mechanical drill over nature are the flowing wells of the Salton Desert, the flowing well at Benson and a supply of 700,000 gallons a day from the deep wells on the Mesa at El Paso. Each of these supplies of water was obtained from localities which superficially were hopelessly dry.

Several of the largest mines in the desert depend almost entirely upon the water transported on cars. The Copper Queen runs its vast smelters and machinery chiefly by water thus obtained, while the famous Sierra Mojada, of Coahuila, with its population of 5,000 people, has not a drop of water except that brought in tanks a distance of 125 miles. Yet these two mines annually return millions of profit.

But the sterile and hopeless-looking soil of the desert, when artificially watered, is apparently more fertile than that region where rainfall is abundant. There is no nobler spectacle than a dreary waste converted into an emerald oasis by water artificially applied, and in the desert may be seen some of the most profitable and skilful agriculture in the world. The wheat fields of Utah and Sonora, the great cotton farms of Coahuila, the alfalfa valleys of the Rio Grande and the orchards of California are all inspiring examples. The transformation made in the desert where irrigation has been possible is marvelous, and in one instance—in Southern California—has resulted in the development of communities of great wealth and culture, where the ideals of perfect conditions for existence are as nearly attained as possible.

A word of caution must be written, however, against an overestimate of the agricultural capacities of the desert. It is necessary artificially to collect the precipitation over large areas, and to concentrate it upon smaller areas by impounds and canals. In this manner at least 25 acres must be set aside as unproductive catchment areas for every one that may be cultivated. All rain water that falls upon the desert or upon its neighboring mountain, if it could be protected and carefully preserved, would not irrigate 5 per cent of the great desert area. The efficiency of the rain of the Great Desert region for agricultural purposes is still further diminished owing to the season in which it falls—June to October—too late for the growing crops, the planting and growing months of spring and early summer being dry. From a practical standpoint it is doubtful if even 1 per

A TYPICAL VIEW OF THE AMERICAN DESERT.

DESERT

cent of the vast area can ever be profitably tilled by irrigation. The underground water supply, too, is entirely insufficient for extensive agricultural uses, even when it is free from injurious salts; and the desert people, after every possible experiment, have long since ceased to anticipate any material supply for irrigation from this source.

From whatever point of view the problem is approached, the sober conclusions cannot be avoided that the desert as an agricultural country has its limitations. The only apparent way in which the area of irrigable lands can be seriously increased is by the construction of reservoirs to save the run-off of the forested mountains, especially that portion of the desert adjacent to the California, Utah and Mexican sierras. Even when this is accomplished there will still be left a vast area of desert. Hence the agricultural product of the desert will never be large, and this product with the exception of the fruits of Southern California will contribute but little for export, and will never be sufficient to supply the needs of its own population. The Great Desert is and will continue to be a profitable market for the consumption of the fresh and preserved food products and forage of the ocean seaboard and Middle West.

Notwithstanding the scarcity of water and forage the pastoral interests of the desert are considerable. Upon the stony foothills and in the mountain cañons the scant herbage and grass supply nutritious foods for many animals, and there are numerous cattle ranches, especially in the Chihuahua province, which are profitable and thriving. Statistics are wanting and hence exact figures cannot be given, but the live-stock values of the desert amount to several million dollars, exceeding the agricultural products many fold.

So far as even the present agriculture in the desert is concerned, it would not exist were it not that its products were consumed at good prices by the people engaged in mining and transportation. One good mining camp, a few acres in extent—and there are many of these—gives employment and remuneration to more people than whole countries of arid farming lands. Previous to the introduction of the railway, mining in the desert was limited to simple processes and products. Without mechanical drills and hoists only moderate depths could be reached, and limited quantities of ore taken out and treated. Consequently the deeper, larger and richer ore bodies remained untouched. Silver and gold were alone considered, and the mines which now yield over \$50,000,000 annually of copper could not be touched.

On the California trail near Pearce, Arizona, for 40 years the overland pioneers built their camp-fires against a ledge of quartz. Since the railway came these rocks are being crushed for the gold they contain at one of the most complete and profitable mills in America. The huge stamps and other machines were brought from New York, Pittsburg, Chicago and Denver; the oil for fuel to run them, from California; the food for the village of over a thousand people living in homes built of Texas lumber is all brought in from the great canning, packing, and fruit-giving sections of the country.

A dozen other places in the desert, each with its modern hoists, smelters, converters and electric appliances, are producing millions of mineral

wealth per annum. Not only have new mines been opened and equipped, but many of the historic old mines of Mexico, abandoned because the limit of hand mining had been reached, have been re-opened with the aid of the steam-hoist and air-drill, and to-day are more productive than ever.

The Great American Desert in 1900 yielded over \$100,000,000 worth of metals—chiefly silver, copper and gold. This represents at 10 per cent a productive capital of \$1,000,000,000. In addition to the paying mines, as large an investment is now being made in mine development and preparation for the coming of lines of railway which are everywhere reaching out to new mining fields. There is every possible reason to expect that the mineral output of the desert will be quadrupled the next decade. Mexico's production of gold has increased from \$4,000,000, in 1897, to \$10,000,000, in 1901; Arizona and New Mexico produced \$3,500,000 worth of gold in 1901. Silver, instead of being a dead metal, is being mined with renewed activity and improved appliances. The American Desert, in 1901, yielded about \$8,000,000 from the United States, and \$34,000,000 from Mexico.

The smelting interests are not the least important adjuncts of the mining industry, and each smelter gives employment to many workmen. The American Smelting and Refining Company, with its capital of \$80,000,000, has great central plants in the desert at El Paso, Aguas Calientes and Monterey. Many of the mines like Boleo, the Copper Queen, the United Verde and Greene Consolidated have their own smelting works.

Many mineral districts of the desert still lie unproductive for want of transportation. This is especially true of the great copper, gold and coal fields of the Pacific States of Mexico, while the rugged western Sierra Madre contain veins of ore awaiting transportation facilities which will furnish many new and important mines.

The total population of the Great American Desert in 1900 was about 1,500,000 people or 1.5 to the square mile, or twice as many to the square mile as the Sahara. Of this total population in the United States, 300,000 are in southern California, leaving less than one person to every two square miles in the remainder of the territory. Of the remaining 700,000 people in the American portion of the desert, at least four fifths are in cities, towns and mining camps. These people in their own picturesque language are by profession "prospectors," "punchers," "nesters," "miners," "lungers," "Mexicans" and "promoters." In plainer English, mineral seekers, cattle men, irrigator-farmers, miners, railroad employees, health-seeking consumptives and laboring Indians, who have abandoned the "blanket" caste, and men who serve as intermediaries between the latent wealth of the desert and the ready cash of the East. As a whole they are an energetic lot. In the United States they consist chiefly of two classes, the Caucasian, whose ingenious brain conceives and develops industries and the Mexican (Indian) peasant, who does most of the manual labor. Across the line in Mexico the same conditions exist, except that the American finds a ready co-operator and companion in the higher caste of Mexican citizens.

The mainsprings of the desert are the hustling western American miners and cattlemen. If any of our readers should still retain in his

DESERT ANIMALS

mind as a type of the desert citizen the bad man with the slouched hat, flowing mustaches and quick-acting revolver, he is at least 10 years behind the times. Whether from the magnificent climatic conditions which induce healthfulness or from the fact that he represents the survival of the fittest, he comes very near the highest type of an American. Self-reliant, unaffected, well built, well dressed, well read and well traveled, he is a man of resources and action, available for any emergency, freer from provincialism, and a little more cosmopolitan than the average resident of any other section of our republic. The aboriginal population of the Great American Desert was and is of quite a different type from that of the nomadic savage who lived by the chase, in the forested mountains and upon the Great Plains. They were largely village dwellers, home builders and agriculturists who by the arts of pottery and weaving had risen to the cultured stage of barbarism as distinguished from savagery. It was their social arts and habits of industry which produced the highest aboriginal type in the ancient Aztec, and it is their blood (not the Spanish) which to-day constitutes the ruling spirit of the most advanced of the Spanish-American republics (Mexico). Upon the invasion of their environment, first by the Spanish and later by the Anglo-American civilization, they assumed at least a portion of these and to-day they are the people who constitute almost the sole laboring classes of the desert, being called Mexicans in the United States and peons or peasants in Mexico.

It is the intensity rather than the density of the desert population that appeals to the observer. Whatever is done is done better than elsewhere. This is a necessity of the desert condition. It will not pay in that region to trifle with inferior methods or products. In mining the best man and the best machine must be had; in farming with expensive water it is a waste to plant poor seed; if cattle are placed on the range they must be good cattle, and so on throughout the entire gamut of industry. The conquerors of the desert seem to inspire a higher plane of living than that met with in the older rural regions and crowded industrial centres of the United States. There is no quibbling over innovations; if good they are adopted. The universities and agricultural and mining colleges of New Mexico and Arizona would be creditable to any country and they are hampered by no quarrels over dogma or political opinions.

The desert cities, if not as densely populous as those of some regions, are unique in their thrift and prosperity. They are all picturesque communities, presenting an interesting mixture of architectural, social, and business conditions, busy with commerce and buoyant with hopes and prospects. Each desert city is thoroughly alive to municipal improvement and development. Electric lights and street cars, water-works, schools, churches, and public libraries abound, while many of the American towns have copied from their Mexican neighbors the picturesque plazas or ornate public parks within the central portions of the busy cities. In many of the Mexican desert cities may be seen the union of all the best of modern industrial improvement with the picturesque Spanish architectural features for which these places are

noted. Steam and electricity have asserted their mastery, but have concealed their cold mechanism behind the prettily stuccoed and flower-entwined walls of the artistic Mexican type.

The Great American Desert as a place of residence is one of the most salubrious on earth. The same climatic feature which renders it sterile—want of humidity—gives to its air a crystalline clearness and purity nowhere else found. At first sight the desert horrifies the passing traveler, but he who dwells in it for a time learns to love its life-giving air and landscape. In the noble wastes of rock and plain man's soul swells to contemplation and forgets the dross and sham of his artificial civilization. The endless vistas uplift the thoughts, and the skies seem to bring with them a clearer vision and content than all the mist and fogs that ever hovered over a humid landscape.

ROBERT T. HILL,

Of the United States Geological Survey.

Desert Animals. Men are apt to think of the vast tracts of absolutely treeless arid sand as uninhabited, because they are void of the creatures known to the regions where humanity dwells. Yet these tracts are often teeming with life. On the shadowless expanse which affords no lurking-place, animals, adapting themselves to the exigencies of their life, often assume the pale tints of the sands whereon, by lying motionless, they may be overlooked by their enemies. They not only develop a protective coloring, but acquire certain other capabilities. They learn, for instance, to subsist on a minimum of water, or to store it within their bodies, some, indeed, developing an ability to live altogether without direct water-supply. Many desert animals are said to aestivate, that is, to sleep throughout the summer, as animals of cold climate hibernate by lying dormant through the winter season. The desert snail, in order to protect itself from dessication, builds up a wall of mucus, sometimes with two or three layers, across the opening of its shell to prevent evaporation of its moisture during the extremest heats. Small desert animals, like plain-dwellers, are burrowers, not only because they can thus escape the fierce rays of the sun, but also because they are so protected against their enemies. Even some serpents burrow, and these are more virulently poisonous than corresponding species of a different habit. All the desert creatures, from the snakes and lizards to the camels, are provided muscularly with the ability to shut out from their nostrils and eyes the sand that is blown by the powerful winds; and most of the insects (except the locusts) are practically wingless, so that these strong desert currents do not carry them away.

The large desert animals are swift, and their feet are adapted for the hot rocks and sand by being cushioned beneath with callous skin. The swiftness of these animals is indispensable to their preservation; for they must generally escape their pursuers by flight, since their habitat affords no hiding-places; moreover, they have to travel long distances for both food and water. Examples of this may be found in the camel and ostrich (qq.v.).

The desert is undoubtedly the refuge of certain animals which have been driven by competition from the more desirable habitations, and which, having located in arid land, have adapted

DESERT LAND ACT — DESHOULIÈRES

themselves to their unfavorable environment. That they are the unsuccessful and outcast representatives of species living under better conditions is substantiated by the fact that they are almost always closely related to the forms in the fauna of the green, fertile lands beyond the desert; the differences usually being only the changes necessitated by difference of habitat.

Desert Land Act, a statute of the United States passed 3 March 1877, and supplemented in 1891, to encourage irrigation by private individuals or associations. It provides that any citizen or intending citizen, by paying a registration fee of 25 cents, and declaring his intent to irrigate within three years, may occupy desert land not exceeding a section (640 acres) in any of a number of specified Western States and Territories, and if he reclaims it within that time may receive a patent for it. He must spend at least \$3 per acre in irrigation or securing water rights; and must have secured the rights before making application. Associations may file joint declarations.

Desert Plants, such plants as are characteristic of arid regions; in general marked by structures adapted to check transpiration of water, such as reduced leaf-surface, absence of leaves, thickened epidermis, hairy or waxy coverings, stomata ("breathing apparatus") in sunken pits, the entrances to which may or may not be protected by hairs, perennial underground parts such as bulbs, tubers, rhizomes; and annual plants which flourish during the wet season, where such occurs, and, like the tops of many of the perennial herbaceous species, die during the dry season. On the other hand water-absorbing organs are often highly developed; the root-systems are not only large but the root-hairs are exceedingly numerous. Storage organs other than underground parts are common, as in many plants with fleshy leaves and in the thick stems of cacti. In regions of less and less rainfall the vegetation becomes more and more monotonous and restricted to the most resistant forms. In addition to intense heat and light, drying winds and small rainfall, the plants have often to adapt themselves to withstand salts which are brought to the surface in solution and left as the water evaporates.

Structural differences and similarities may be observed in the plants characteristic of Alpine and Arctic conditions. Another striking character of desert plants is their restriction to a limited area (see ENDEMISM) by isolation and by enforced adaptability to peculiar conditions, in which respects desert and Alpine plants are similar, but in which each differ from Arctic plants that have a wide range. See ALPINE PLANTS; ARCTIC PLANTS; HALOPHYTES; PLANT GEOGRAPHY; XEROPHYTES.

Desertas, dǎ'sēr-tās, a group of three small rocky islands in the Atlantic Ocean, to the southeast of Madeira, visited at certain seasons of the year by fishermen and herdsmen.

Deserted Village, The, the title of a poem by Oliver Goldsmith (1770). It is supposed to describe the village of Lissoy, in the County of Westmeath, Ireland. See GOLDSMITH, OLIVER.

Deserter, in military affairs, a soldier or sailor who quits the service without leave. In the United States desertion from the army or navy in time of war is subject to court-martial

which nearly always means a sentence of death. Desertion under ordinary conditions is punishable by dishonorable discharge and five years' hard labor. The United States government offers a monetary reward for the arrest and delivery of a deserter, the sum usually ranging from \$20 to \$30. In every civilized country the laws against desertion are similar to those of our own land—always severe upon the man who abandons his duty, punishing him with harshest discipline, and sometimes, death.

Desertion by either husband or wife without lawful reason is sufficient cause for legal separation, or instituting proceedings for divorce. A wife, however, may secure an order to protect money or other possessions she may acquire from the time of desertion. This makes her property immune against husband or his creditors. On the other hand the husband is not held responsible for any debt or contract his wife may engage in during her voluntary leave of his "bed and board." In nearly all parts of the United States, as well as in countries of Europe, desertion is good ground for divorce, though there are differences as to the period of time which must elapse before action can be instituted.

Desfontaines, Pierre François Guyot, pē-ār frān-swā gē-ō dā-fōn-tān, Abbé, French writer; b. Rouen 1685; d. Paris 1745. He was one of those known to us more for their controversies with Voltaire, and his biting attacks, than from their own productions. Voltaire, by the superiority of his wit, succeeded in gaining many to his opinions; but impartial judges have long agreed that he was not altogether correct, and that the criticisms of the Abbé Desfontaines, though severe, are by no means unjust. One of the works of the abbé, which had the misfortune to excite the particular displeasure of the poet, was the well-known 'Dictionnaire Néologique,' of which the sixth edition appeared in 1750 and which was intended to guard the purity of the French language, as the great writers of the 17th century had formed it; and in this respect it has certainly proved of much service.

Desful, dēs'fool, or **Dizful**, dēz'fool, Persia, city in the province of Khuzistan, 30 miles northwest of Shuster. About 30,000 inhabitants.

Desgoffe, Blaise Alexandre, blāz ä-lěks-āndr dā-gōf, French painter; b. Paris 17 Jan. 1830. He is famous for having imitated jewels and trinkets with pastes, and transparent coats of color. Among his works are: 'Oriental Agate Cup of the 16th Century,' after the original in the collection of jewels in the Louvre; 'Oriental Vase on Enameled Pedestal of the 16th Century'; 'Amethyst Vase of 16th Century'; Luxembourg; 'Onyx Jug'; 'Money Bag of Henri II., Enamels of Jean Limonsiu,' Luxembourg; and many fruit and flower pieces.

Deshoulières, Madame Antoinette de Ligier de la Garde, ān-twān-ēt dē lē-zhē-ā dē lā gārd dā-zoo-lē-ār, French poet; b. Paris 1 Jan. 1638; d. there 17 Feb. 1691. During the war of the Fronde she followed her husband into exile at Brussels, and he rescued her after she had been for eight months imprisoned at Vilvoorden as a suspicious personage. She was called the 10th muse and the French Calliope on account

of her idyls 'Les Moutons' and 'Les Fleurs.' Her subsequent failure in writing tragedy caused this advice to be given her: "*Retournez à vos moutons.*" Her best work and inspirations are found in her 'Idylls,' especially in 'The Sheep,' 'The Flowers,' 'The Birds.' Voltaire was of opinion that of all the French poets of her sex she had the greatest merit. Several learned societies elected her a member, and her agreeable manner, her animation and wit, which sometimes, but rarely, gave way to a gentle melancholy, made her the centre of attraction in the best societies at that period.

Desiccation, the evaporation or drying off of the aqueous portion of bodies. It is practised with fruit, meat, milk, vegetable extracts, and many other matters. It is usually done by a current of heated dry air, and as such may be considered as distinguished from evaporators, so called, to which furnace heat or steam heat is applied.

Desiderio da Settignano, Di Bartolommeo Di Francesco, dā bār-tō-lōm-mā-ō dē frān-chēs-kō dā-sē-dā-rē-ō dā sēt-tēn-yā'nō, Florentine sculptor: b. 1428; d. 1476. He was a pupil of Donatello. His chief work is the tomb of Carlo Marsuppini, chancellor of the Florentine republic, in the church of Santa Croce. Another church in Florence possesses a statuette of the Infant Jesus by this sculptor, of which there is a replica in the Louvre. The genuineness of many busts attributed to him has of late been disputed.

Desiderius, Lombard king. He was the last ruler of the Lombards and after being besieged in Pavia by Charlemagne was carried captive to France.

Design, in painting, the first plan of a large work, drawn roughly, and on a small scale, with the intention of being executed and finished in large. See **DRAWING**.

In music, design means the invention and execution of the subject in all its parts, agreeably to the general order of the whole, especially in the composition of works of classical formulae as required by a sonata or symphony.

In manufactures, design expresses the figures with which the workman enriches his stuff or silk, and which he copies after his own drawing, or the sketches of some artist.

In architecture, a plan of an edifice as specified by the ground-plans, elevations, sections, and any other outlines necessary to guide its construction.

Design, Schools of, schools in which art is taught with an industrial application in view rather than a purely æsthetic end. Theoretically such schools may be considered as intermediate between schools of technology, in which (with the exception of the architectural courses) designing is of a purely mechanical nature and application, and schools for the training of artists; yet in actual practice this distinction is not always followed. The best results in applied art are produced by foundation work similar to that essential in preparation for a distinctively æsthetic career. The courses in such schools vary in detail but generally include most of the following principles of decoration, and the history of art—especially in its decorative aspects; copying and variation of designs;

original designing for textile fabrics, wall-paper, stained-glass, pottery, leather-work, book-covers, etc.; and the study of the best examples of designing—for which accessible museum collections are essential. To this is added instruction in technical manipulation.

The definite endeavor to promote art education with the purpose of developing and improving the art industries of the nation had its rise in England as a result of the first international exhibition, that of 1851, at Hyde Park, London. In the United States a similar movement originated in Boston in 1870, and was an outcome of the former. The related branches of industrial art drawing and manual training owed much to the impetus given by the Centennial Exhibition of 1876. The new spirit was felt by the public schools and wrought marked changes in them during the next quarter of a century, and museums of art were created and developed. Among the institutions offering courses in applied art in the United States, may be mentioned the schools of Cooper Union; the Lowell Free School of Industrial Design (1872), affiliated with the Massachusetts Institute of Technology; the School of Design for Women in Philadelphia; the School of Design of the University of Cincinnati; and the University of Minnesota, which has a four years' course in drawing and industrial art. The large cities of Europe were provided with facilities for teaching industrial art long before such a necessity was apparent in Great Britain and the United States. In Paris the École Nationale et Spéciale des Arts Décoratifs, in Berlin the Bau Akademie, and in Vienna the Imperial Art Institute, may be especially noted. The great schools devoted to the training of artists created the atmosphere and impulse without which the more practical schools would be impossible, but they hardly come within the scope of this review. Among the results produced in Great Britain by the recognition in 1851, of the superiority of France in the arts of applied design, was the creation of the South Kensington Schools and Museum of Art, which have been powerful factors in effecting the great change in that nation. See **ART EDUCATION**.

Désirade, dā-zē-rād, an island of the West Indies, dependency of Guadeloupe, from which it lies about nine miles to the east. Since 1814 it has been a French possession. It has an area of 10 square miles, and a population of about 1,300, composed mainly of emancipated slaves. It is known as the island which Columbus first discovered on his second voyage in 1493, and to which he gave the Spanish name Deseada, "desired."

Desjardins, dā-zhâr-dân, **Alphonse**, Canadian journalist and politician: b. Terrebonne, Quebec, 6 May 1841. He was educated at Masson and Nicolet colleges, and was admitted to the bar in 1862. In 1868 he turned his attention to journalism, was on the staff of 'L'Ordre,' and later became editor-in-chief of 'Le Nouveau Monde.' He assisted in organizing the Papal Zouaves sent to the aid of the Pope in 1868, and is a member of the Order of Pius IX. He was a member of the lower house of the Canadian Parliament 1878-92, and was then called to the Senate. In 1893 he was mayor of Montreal, and in 1896 for a short time minister of militia, and then minister of public works.

DESIGNS

European and Asiatic Designs of the 17th and 18th Centuries.

DESJARDINS — DES MOINES

Desjardins, Martin, mār-tān, gallicized name of **Martin Vanden Bogaert**, French sculptor: b. Breda, 1640; d. Paris 2 May 1694. He excelled as a sculptor, decorator, and wood-carver, executing many works for the churches of Paris, the College of the Four Nations, palace of Versailles, etc. His chief work was a monument to Louis XIV. 1686, removed in 1792 and destroyed save a few parts now in the Louvre and the Invalides. Another Louis XIV., an equestrian statue, remains at Lyons, with several portraits in busts and bas-reliefs at the Louvre and at Versailles.

Desman, dēs'mān, a genus of aquatic mole-like animals of the family *Talpidae*. The two species are different in habitat and in size, the larger (*Myogale moschata*) being found in Russia, the smaller (*M. pyrenaica*) on the slopes of the Pyrenees. In both species the fore limbs are not, as in other moles, adapted for digging; the feet are completely webbed, the hinder ones being quite large; and the snout forms a long flexible proboscis. The tail is long and scaly. This animal inhabits a burrow in the bank of a stream, and feeds upon insects, river-mollusks, and such food as it finds in the mud of the banks. Though its flesh is not edible, it is hunted by the Russian peasants for its fur.

Desmarets de Saint Sorlin, Jean, zhōn dā-mā-rā dē sǎn sōr-lān, French poet: b. Paris 1595; d. there 28 Oct. 1676. He was a favorite of Cardinal Richelieu, and one of the first members of the Academy. He wrote several plays, among them a character comedy, 'The Visionaries' (1637), received with great favor. Some of the comic figures had Molière for their original. He wrote also epics: among them 'Clovis' (1657), and 'Mary Magdalene' (1669). In his early years he led a wild, disordered life; but later became a devotee, and wrote many religious poems and anti-Jansenist polemics.

Desmarres, Louis Auguste, loo-ē ô-güst dā-mār, French oculist: b. Evreux 22 Sept. 1810; d. Neuilly 23 Aug. 1882. He powerfully promoted the knowledge of the pathology and anatomy of the eye, and invented an ophthalmoscope now generally used. His 'Theoretical and Practical Treatise on Diseases of the Eyes' is a standard authority.

De Smet, dē smēt, Peter John, American Jesuit missionary to the Indians: b. Dendermonde, Belgium, 31 Dec. 1801; d. St. Louis, Mo., 23 May 1873. In 1822, being yet only a scholastic in the order, he was sent by his superiors to join the Jesuit mission in the United States and was an instructor first in the Indian school at Florissant, Mo., and then (1828) in the university newly founded at St. Louis. After this, having been ordained priest, he entered on his destined field of labor as missionary to the aborigines, traversing on foot or in canoes or with whatever means of conveyance was possible, the regions inhabited by the Potawatomes, 'Sioux, Blackfeet, Flatheads, Pend' Oreilles, and other tribes in the valleys of the Missouri, Yellowstone, Platte, and Columbia, and on both sides of the Rocky Mountains. On many occasions he was a commissioner on behalf of the United States government in pacifying the redmen when, provoked to fury by the wrongs done them, they went on the war path. In his journeys he wandered over 100,000 miles in those

wildernesses in the course of his labors of 40 years. But in the meantime he made visits to Europe repeatedly, to collect funds for support of the missions and to enlist young men for labor in the same field. His collections in Europe amounted to 1,000,000 francs. He wrote several narratives of his experience in the western wilds, among them, 'Letters and Sketches of a Residence in the Rocky Mountains' (1843); 'Oregon Missions' (1847); 'Western Missions' (1863); 'New Indian Sketches' (1868).

Desmidiaceæ, dēs-mīd-i-ā'sē-ē, or **Desmidiææ**, a natural order of microscopic freshwater *Algæ*, not unlike diatoms in some respects, but easily distinguishable from these by their color and the fact that they have non-silicified walls. They are green gelatinous plants composed of variously formed cells having a bilateral symmetry, which are either free, or in linear series, or collected into bundles or into star-like groups, and imbedded in a common gelatinous coat. Reproduction is effected, as in diatoms, either by conjugation, or by the halves of a cell developing between them two bud-like projections, each of which ultimately forms with its adjacent half of the old plant a new individual. Their beautiful forms make them much-prized objects for the microscope.

Desmo'dium, a genus of plants of the natural order *Papilionacæ*, or pea family. In recent classification it is included in *Meibomia* (q.v.).

Desmognathæ, dēs-mōg'nā-thē, one of the groups of carinate birds proposed by Huxley. The vomer is absent, or at least reduced and slender, and the maxillo-palatines are united in one of several ways across the middle line. The great diversity of the contents of this group will be evident when it is mentioned that it includes the ducks, cuckoos, parrots, kingfishers, etc.

Des Moines, dē moin, Iowa, city, capital of the State, and county-seat of Polk County; at the junction of the Des Moines and Raccoon rivers, and on the Rock Island, the Northwestern, the Burlington Route, the Chicago, Milwaukee & St. Paul, and several other railroads. It is built on a plateau from 15 to 20 feet above the tidewater and is intersected by both rivers, which are spanned by eight bridges. The business portion lies near the rivers, and the residences are on the higher grounds beyond.

The city has two public parks of 40 acres each, and spacious State fair grounds. Among the notable buildings are the Old Capitol, erected in 1856; the New Capitol, erected at a cost of \$3,000,000; the United States building, containing the post-office and federal courts; the State library, with 50,000 volumes; the Grand Opera House, city hall, State arsenal, and about 75 churches. The city is located in the centre of a rich coal-mining district, the mines in the vicinity employing 2,000 persons, and having an annual output of 600,000 short tons. The principal industries, besides coal-mining, include pork packing and the manufacture of starch, glass, liquors, pipe, brick and tile, foundry and machine shop products, and brass goods. Good public and parish schools provide for the elementary education of the young; and in addition there are several high schools, the Des Moines College, Drake University, and Highland Park Normal College. Pop. 62,139.

DES MOINES COLLEGE — DE SOTO

Des Moines College, a coeducational institution at Des Moines, Iowa, was organized in 1865 under the name University of Des Moines. This name was afterward changed to Des Moines College in order to conform more nearly to the aim of its supporters, the Baptists of Iowa. Like most schools of the kind, it has passed through severe financial struggles and reverses. It is now entirely free from debt, with an invested endowment of about \$80,000 and pledges sufficient to increase this sum to \$100,000. It also has a beautiful campus comprising two blocks, upon which are two substantial brick buildings. An additional block adjoining is set apart as an athletic field, the whole comprising about nine acres and valued, with the buildings, at \$60,000. The school has four departments: college, academy, music, and art. The college has steadily maintained as its aim a high class of work, and has taken rank with the best of Iowa colleges. It has 22 instructors. It was the first college to become affiliated with the University of Chicago. Under this arrangement the work of the school is constantly subject to the approval of the University. Professors and instructors have ample opportunity to carry on their own studies, either in attendance at the University or by correspondence.

J. P. STEPHENSON.

Des Moines River, the largest river in Iowa; formed by the east and west forks in southwest Minnesota; flows south-southeast to the capital city, then southeast to a point about four miles below Keokuk, where it empties into the Mississippi River; estimated length, 500 miles. It drains 10,000 square miles in Iowa; flows through a region rich in agricultural and grazing grounds, bituminous coal, and timber; receives the water of Raccoon, North, Middle, South, and Boone rivers; and with a fall of eight feet supplies a large number of valuable mill sites along its banks.

Desmoulins, Benoît Camille, bē-nwā kāmēl dā-moo-lān, French revolutionist: b. Guise, Picardy, 2 March 1760; d. Paris 5 April 1794. From the commencement of the Revolution he was connected with Robespierre, with whom he had studied at college. His friendship for Danton was the cause of his fall. Robespierre, at the head of the committee of Public Safety, was making rapid progress toward tyranny. Danton, assisted by the leaders of the Cordeliers, intended to resist this committee, and Camille commenced the attack in his journal, 'Le Vieux Cordelier,' in which he declared himself against the terrorists, and even made use of the word clemency. With Danton he was arrested on the order of Robespierre on 30 March 1794. On 2 April he was tried and condemned, and on the 5th was executed.

Desnoyers, Auguste Gaspard Louis Boucher, ô-güst gās-pār loo-ē boo-shā dā-nwā-yā, BARON, French engraver: b. Paris 20 Dec. 1779; d. there 15 Feb. 1857. At the age of 20 he received a prize for an engraving of Venus disarming Cupid, and in 1801 established his reputation by the reproduction of Raphael's 'Belle jardinière,' in the gallery of the Luxembourg. His most admired productions are copies of that great master's works, and prominent among them is an engraving of the 'Transfiguration.' He was elected a member of the institute in 1816, appointed chief engraver

to the king in 1825, created baron in 1828, and officer of the legion of honor in 1835.

Desnoyers, dē-nwā-yā', Louis, French journalist and novelist: b. Replonges, Ain, France, 1805; d. Paris 17 Dec. 1868. He founded the journal 'Charivari' (1832), and was one of the founders of the 'Siècle.' He wrote some vaudevilles, and several novels, such as 'Adventures of Jean-Paul Choppart' (1836); 'Mémoires of a 20-Sous Piece' (1837).

De Sola, Abraham, Canadian rabbi: b. London, England, 18 Sept. 1825; d. New York 5 June 1882. Under the careful supervision of his father he received a thorough Hebrew education, and having perfected himself in his general studies, he was called in 1847 to Montreal, Canada, by its Portuguese-Hebrew congregation. His scholarship and energy soon brought him to the front, and in 1848 he was appointed professor of Hebrew and Semitic literature in McGill College, Montreal. His literary labors consisted partly of contributions to the 'Occident' of Philadelphia and 'The Jewish Messenger' of New York, on historical and rabbinical themes, and partly of a revision of the Portuguese-Hebrew liturgy. On 9 Jan. 1872 he opened the House of Representatives of Washington with prayer, the first foreign clergyman to have received the privilege. Among his more important works may be mentioned: 'The Sanatory Institutions of the Hebrews'; 'Lectures on the Mosaic Cosmogony'; and 'Scripture Zoology.' He was for many years president of the Natural History Society of Montreal.

Desol'ation Land, or Desolation Island, an island belonging to Chile, in the archipelago of Tierra del Fuego. It is 70 miles long and about 15 miles in breadth. The name Desolation Island is also sometimes applied to Kerguelen Land in the Indian Ocean. See KERGUELEN LAND.

De Soto, dā sō'tō, Bernardo, Costa Rican statesman: b. 1854. He was elected president of the republic in 1887. During his administration the finances of the country, disordered by Guardia, were placed on a secure footing, and the work of completing the interoceanic railway from Port Limon, on the Caribbean Sea, to San José, the capital, and thence to Punta Arenas, on the Pacific coast, was prosecuted. Under him the long-dreamed-of unification of the central American republics became an accomplished fact.

De Soto, Hernando, ār-nān'dō, Spanish nobleman, conqueror, and explorer: b. Villanueva de la Serena (Badajoz) about 1496; d. 1542 or 1543. The date of his birth can not be ascertained precisely, some authorities placing it as late as 1500. But that which is here given is more likely to be correct, especially because we find him bearing a conspicuous part in central American expeditions between the years 1516-20. We can not easily assume that he was less than 20 in 1516. As a captain in 1523-4 he shared the adventures of Córdoba's fleet on the Nicaraguan coasts, and was overcome by Gil Gonzalez Dávila (q.v.) through treachery. Joining Francisco Pizarro in Panama with two ships, 60 men, and 10 horses, to take part in the conquest of Peru, he was appointed second in command. In 1532 he was the first Spaniard who spoke with Atahualpa; going to visit the unfortunate Inca in the character of an ambas-

sador, he continued to be well disposed toward him during his captivity. He returned to Spain in 1536, where he married in Madrid, the following year, Inés de Bobadilla, daughter of Pedrarias Davila (q.v.). Wholly misled by the first reports of the wealth of Florida, De Soto resolved to undertake the conquest of that country, which was represented to be as rich as Peru. He sold his property, and devoted the proceeds to the equipment of his ships and the outfit of his men, Charles I. bestowing upon him readily enough the title of governor of Florida and Cuba. At Sanlúcar he collected 950 fighting men, besides the sailors. Seven large ships and three small ones formed the fleet, his wife and family accompanying him in the San Cristóbal. Sailing from Sanlúcar 6 April 1538, he reached Santiago de Cuba safely, and there entered upon his duties as governor of the island; but transferred his authority at that point to his wife before proceeding to Havana (August 1538). By his orders Havana harbor was fortified (see CUBA). During the stay in Cuba his command was strengthened; 1,000 well-armed men were finally ready, and this was probably the best force which up to that time had undertaken the conquest of any part of America. The fleet sailed from Havana 12 May 1539. In Florida the Spaniards were moderately successful until they reached the province of Tascaluza, where a great host of natives attacked them. It was said that in this nine hours' fight 11,000 Indians fell, while on the Spanish side 70 were killed and nearly all (including De Soto himself) were wounded. Worn out by the long marches, which did not lead to the discovery of treasure, the soldiers plotted to abandon the enterprise. On learning of this, De Soto marched his men toward the interior, hoping to reach New Spain (Mexico) by land, and knowing that, at any rate, his followers would not care to desert him when the ships had been left far behind. In a nocturnal battle (December 1540) the Spaniards were again severely treated. Four months later they came upon a fort surrounded with a stockade, in storming which many were killed, and nearly all wounded. De Soto still led them forward, through the present Gulf States, and probably as far north as Kentucky, until he contracted a fever and died—according to Garcilaso, in 1542, though Herrera says 1543. The Spanish soldiers, who had thought to leave their commander in the lurch, were in this manner finally separated from him. At first they buried him in a trench the natives had opened near a village on the bank of a great river he had discovered; but several days afterward—either fearing the hostiles would dishonor the body, or suddenly realizing how they themselves might best honor it—they hollowed out the trunk of an evergreen oak, weighted the rude coffin with armor, placed the disinterred body within it, and sunk it by night in the deepest part of the river, which they called the Grande and we call the Mississippi.

MARRION WILCOX.

De Soto, də sō'tō, Mo., a mining city in Jefferson County, on the St. Louis, Iron Mountain & Southern Railroad, about 40 miles south by west of St. Louis, and 15 miles west of the Mississippi River. In addition to its mining interests of zinc and lead, it has a large trade in agricultural products. Its industries include

a flouring-mill, and the repair shops of the railroad. Pop. (1900) 5,611.

Desoxybenzoin, phenyl-benzyl-ketone, $C_6H_5.CO.CH_2.C_6H_5$; obtained by the action of zinc and hydrochloric acid on chlorobenzil $C_6H_5.CO.Cbl_2.C_6H_5$, or by heating monobrom-stilbene with water to 180°. It crystallizes out of alcohol in large tables which melt at 55°. Desoxybenzoin can also be obtained by reducing benzoin $C_6H_5.CO.CH(OH).C_6H_5$.

Despard, dēs'pārd, **Edward Marcus**, Irish soldier: d. London 21 March 1803. He was superintendent of the English colony in Honduras. In consequence of complaints made against him he was recalled in 1790. This made him disaffected, and he matured a plan to assassinate the king on his way to open Parliament. The conspirators were arrested and tried by special commission at Southwark 5 Feb. 1803. There being no doubt of their guilt, Despard and nine of his associates suffered death.

Despenser, dē-spēn'sēr, **Hugh 1e**, English courtier: b. about 1262; d. 27 Oct. 1326. He distinguished himself as a soldier and diplomat in the service of Edward II. and became Earl of Winchester in 1322. His tyranny as the royal favorite led to a revolt of the barons and his own downfall.

Despenser, **Hugh 1e**, English courtier, son of the preceding: b. about 1290; d. November 1326. He deserted the baronial party for that of Edward II., and became a royal favorite. He and his father were involved in the misfortunes following the flight of King Edward from London, and were beheaded in the same year.

Despériers, Bonaventure, bō-nā-vān-toor dā-pā-rē-a, French writer: b. Arnay-le-Duc about 1505; d. 1544. He was secretary to Margaret of Navarre. He wrote a series of 90 stories: 'New Recreations and Merry Conceits,' printed in 1558. In 1537 was published his 'Cymbalum Mundi' in French, a virulent attack on the Christian religion, which was burned by the common hangman, and of which only one copy is in existence.

Des Plaines (dè plān) **River** (named from a species of maple called by the French *plaine*). A river of Illinois which rises in the southeastern part of Wisconsin and flows south and southwest until it unites with the Kankakee River at Dresden, Ill., to form the Illinois River. In length the Des Plaines is about 150 miles. For some distance the river flows almost parallel with the shore line of Lake Michigan. For several miles the waters of the Des Plaines have been made to contribute to the Chicago Drainage Canal (q.v.)

Despoblado, dāz-pō-blā'dō (desert), a name given in South America to any barren tracts in the Andes, which are so high and cold as to be uninhabitable. It is given as a specific name to (1) a treeless, uninhabited plateau, nearly 10,000 feet above the sea, on the Bolivian and Argentine frontier; and (2) a region in Peru between the central and western Cordilleras, ranging from 14,000 to 18,000 feet above the sea-level.

Despot (from the Greek *despotēs*), originally a master, a lord; at a later period it became an honorary title which the Greek emperors gave to their sons and sons-in-law when governors of provinces. Alexis III., surnamed Angelus,

DESPOTO DAGH — DETECTIVE

toward the end of the 12th century, is said to have first introduced this title, and to have made it the first in rank after that of emperor. Thus there was a despot of the Morea, of Serbia, etc. At present, despot means an absolute ruler, as the emperor of Russia; but, in a narrower sense, it conveys the idea of tyranny, as in fact the possession of absolute power and the abuse of it are two things bordering very closely on each other.

Despoto Dagh, *dēs pō tō dāh*, a mountain chain of European Turkey, extending from 30 miles to the east of the Balkans to the bank of the Maritza.

Dessaix, Joseph Marie, *zhō-zěf mā-rē dā-sā*, French general: b. Thonon, Savoy, 24 Sept. 1764; d. 26 Oct. 1834. He served at the siege of Toulon, and in Italy under Bonaparte; was elected in 1798 to the council of 500, where he opposed the *coup d'état* of the 18th Brumaire. He was made a brigadier-general by Bonaparte in 1803, and, in the campaign of 1809 against Austria, a general of division, receiving from the emperor the surname of *L'intrepide*, and the title of count of the empire.

Dessalines, Jean Jacques, *zhōn zhāk dā-sā-lēn*, emperor of Haiti: b. 1760; d. 14 Oct. 1806. He took the name of the person in whose service he remained until 1790; after that time he fought under Blasson, and, still later, joined Toussaint L'Ouverture. In his struggle against Gen. Rigaud he signalized himself as much by his cruelty as his bravery. In 1802 he surrendered to Gen. Leclerc. But when an epidemic of yellow fever fell upon the French army and almost annihilated it, he attacked Rochambeau with an army of 30,000 blacks, thus obliging the French commander to surrender to the English, and to leave the island (1803). In 1804, when governor-general of Haiti, he issued an order for the general slaughter of the white inhabitants. In October of the same year he was proclaimed emperor, and made an unsuccessful attempt to take the city of Santo Domingo in March 1805. Incurring the enmity of his own followers, he was killed in an ambush near Port au Prince.

Dessau, *dēs'sow*, Germany, capital of the duchy of Anhalt, in a valley on the Mulde, on the railroad between Berlin, Köthen, and Leipsic. The principal building is the ducal palace, built in 1748, containing both a picture-gallery and a library, in which are numerous MSS. of Luther. The manufactures consist of woolen and linen cloth, hats, leather, tobacco, musical and other instruments. The ground around Dessau, originally a sandy waste, has been completely reclaimed, and is now covered with beautiful gardens. Pop. 42,375.

Dessicants, in medicine, substances that check secretions from mucous membranes or cause cicatrization. See **ASTRINGENTS**.

Desterro, *dās-tār'rō*, also called officially **Florianopolis**, Brazil, the capital of the state of Santa Catharina. It is situated on a long and narrow island near the mainland, and its foreign trade passes through the port of São Francisco, which is one of the best on the coast of southern Brazil. During the revolt of the navy in 1893, the most critical period through which the new Brazilian institutions have passed, Desterro and its port were head-

quarters of the rebellion. Pop. (1903) estimated 15,000.

Destouches, Philippe Néricault, *fā-lēp nā-rē-kō*, French dramatist: b. Tours, France, 22 Aug. 1680; d. near Melun, France, 4 July 1754. His comedy, 'The Boaster' (1732), is a masterpiece in matter, in elaboration, and in character delineation; Lessing classes that work, with its companion piece, 'The Spendthrift' (1736), as "models of the finer high comedy." Hardly inferior to these is 'The Married Philosopher' (1727), largely based on the author's own life.

Destroying Angels. See **DANITES**.

Destutt de Tracy, Antoine Louis Claude, *ān-twān loo ē klōd dā-stūt dē trā-sē*, COUNT, French philosophical and metaphysical writer: b. Paris 20 July 1754; d. there 10 March 1836. Though in repeated peril during the French Revolution, he survived to write 'Elements of Ideology' (1817), a development of Condillac's philosophy, and in part an exposition of what then passed for economics. His 'Delineations of the Politics of the World's Nations' (1820), and prior works, received considerable notice in the United States through Jefferson, who translated the 'Commentaire sur l'Esprit des Lois' (1806) into English and had it published in Philadelphia (1811).

Desulto'res (from *desilio*, "I vault"), the Latin name for vaulters or leapers, who jumped from one horse to another. The Scythian, Indian, and Numidian cavalry were very expert desultores, and each man carried at least two horses to the field. When one was weary he jumped with great agility upon another, which he led by his hand. The Greeks and Romans introduced the same practice in their games, races, and funeral solemnities, but never, as far as we know, in war. Homer describes a vaulter of this sort who performed his feats on four horses at once (Iliad, xv. 679); and Livy (xxiii. 29) describes a kind of Numidian cavalry in Hasdrubal's army in Spain, in which the soldiers had two horses each, and in the heat of an engagement frequently leaped, fully armed, from one to another. Ælian gives a similar account of a tribe dwelling not far from the Danube, who, on this account, were called *Amphippi*.

Detachment, a body of troops or part of a fleet selected from the main body for some special service.

Detaille, Jean Baptiste Edouard, *zhōn bāp-tēst ēd-oo-ārd, dē-tā-yē*, French painter: b. Paris 5 Oct. 1848. He is distinguished for his treatment of battles and military subjects. One of his best pictures, 'The Passing Regiment,' is in the Corcoran Art Gallery in Washington, D. C.

Detective, one who searches for criminals or ferrets out crime. The work of the detective is allied to that of the police, and wherever a police force exists there is some detective work to be done, though only in connection with a large police force are men regularly assigned to detective work. The police force of New York includes a body of men known as detective sergeants, who have charge of the work of looking for criminals or investigating such crimes as seem to call for their services. The United States government maintains a force,

DETERMINANT — DETERMINATIVE MINERALOGY

known as Secret Service men, whose principal duties consist in unearthing counterfeiters, and those who rob the mails or infringe the revenue laws. The British government has established in London a force of detectives known as Scotland Yard men.

There are private detective establishments in all large cities, the best-known of these being the Pinkerton bureau, which has offices in several cities of the United States under the style of the Pinkerton National Detective Agency. This agency and similar bureaus make a business of supplying detectives to any one who will pay for the work, usually to get evidence in civil or criminal suits.

The detective achieves success by studying the ways of lawbreakers, and becoming acquainted with the haunts of the men he seeks. For instance, William Pinkerton, of Chicago, made an exhaustive study of the class of tramps who rob country stores and post-offices, and blow off the doors of safes. Their own name for their class is "yeggmen," and the only way to know them thoroughly is to become one of them for a time, to live as they do, and thus secure their confidence, and gain familiarity with their system of exchanging information. These yeggmen had a habit of registering on the tank houses of railway stations, where they would write the names by which they were known, with the date, and the direction they were going. Doubtless this practice has changed for some other, since the detectives became familiar with it, and used their knowledge to lodge various bad characters behind the bars.

Those detectives who achieve the best results make a specialty of one line of work, with which they become perfectly familiar. In a city like New York there is on the detective force at least one man familiar with the ways of each of the principal classes of crooks. If a pick-pocket is wanted, the man familiar with that work is supposed to have a pretty good idea what pickpockets are in town, and where they can be located; if he be an extra good detective, he will also be able to form a judgment from the nature of a steal, who are most likely to have been the thieves. It is this sort of knowledge that makes possible the quick detection of criminals.

The nature of detective work is such that very little authoritative matter has been printed about it. One of the first requisites of a detective is the power of keeping silence about the business or the cases on which he works. There are no printed reports and statistics of detective work that could be used in an encyclopædia. Most of the literature is of the nature of detective stories, told to amuse, and concealing instead of making clear real occurrences or facts. The detective at work is really a very different man from what he is pictured in the novel. He has usually had police experience, and is big and strong. These things, with a knowledge of the class of men he is to seek, are his stock in trade. One of the most common and difficult jobs that falls to his lot is the simple following of a man, whom he has located, but whom he does not wish to arrest, until he has traced him to his living place or some haunt where he can also expect to locate some companion or accomplice. To follow a man in an ordinary way is to invite him to escape, for if a crook in a city street

suspects he is followed, he is almost certain to elude the pursuer. The detective who follows one must not stop whenever his man stops, but go right on and appear to pay no attention to him. He must know enough to jump on a car to get ahead of his man, and to be out of view; to dodge through a short-cut if there be one where he cannot lose his man, or to do any one of a dozen things promptly to serve his purpose. It is dangerous to take his eyes off the crook, and equally dangerous to let the crook have a good look at his shadower, so that if the following has to be kept up for any considerable distance it is a very trying piece of work.

The private detective has fallen into some disrepute in the United States, owing to employment on divorce cases or other matters where there is a temptation to manufacture evidence instead of finding it. Some judges have refused to credit the testimony of such detectives unless corroborated. In many cities private detectives are obliged to take out a license before they are allowed to follow the calling.

The Secret Service men whose duty it is to protect the mails have a simple method of locating thieves. Whenever a letter is lost, and a tracer sent after it, and the man found who last had knowledge of the letter, a pin is stuck in a map at the city where the letter was last seen. As more lost letters are searched for, the pins in this map begin to show central points where letters disappear with regularity. This shows about where there is regular thieving, and a detective has his field of work clearly pointed out to him, and by watching the men who handle the mail in that district he is usually sure of locating his man before very long. See also POLICE; SECRET SERVICE.

Determinant, in logic, a mark or attribute added to the subject or predicate, which narrows the extent of both, but renders them more definite, or better determined. In mathematics, a name given to the sum of a series of products of several numbers, these products being formed according to certain specified laws. Thus the determinant of the nine numbers:

$$\begin{array}{ccc} a, & b, & c \\ a', & b', & c' \\ a'', & b'', & c'' \end{array}$$

is $ab'c'' - ab''c' + a'b''c - a'bc'' - a'bc' + a'b'c'' - a'bc'' - a'bc' + a'b'c''$. The different products of which a determinant is the sum are called its "elements." The different quantities which are multiplied to form the elements are called the "constituents" of the determinant. From the upper left-hand to the lower right-hand corner is the oblique line called the "principal diagonal." "The secondary diagonal" is the conjugate line of places. The square root of the number of constituents is the ordinal number of the "order" or "degree" of the determinant.

Determinative Mineralogy, that division of the science of mineralogy (q.v.) which treats of the identification of unknown minerals. The expert mineralogist is able to recognize at sight several hundred distinct species of minerals, and many varieties when the specimens brought to his notice are typical. Such ability is the result of much study and experimentation, as well as careful observation of the physical differences between the species. Some times the usually constant properties of certain minerals vary to

DETERMINATE PROBLEM—DETERMINISM

such an extent as to disguise the species. It is then necessary to make such tests as experience has proved are requisite in order to identify the mineral. Though the aid of an elaborate series of determinative tables is usually sought, it is always wise to make a few preliminary tests in order to learn what are some of the most prominent of the physical properties of the mineral. Quite often valuable suggestions as to the character of the mineral, and at times its identity, may be learned by testing its hardness, streak, or cleavage, or by taking its specific gravity, or by observing its crystal form, structure, lustre, color, and feel.

Hardness is a factor of prime importance in the determination of minerals. The number of exceedingly hard minerals is very small. If a mineral is not scratched by topaz, it must be some one of a dozen minerals, and these are usually differentiated with ease by other simple physical tests. Ruby is thus separated from garnet, while, if its crystal form is distinct, it may readily be distinguished from the very similar ruby spinel, which is nearly as hard. A knife-blade is all that is needed to prove that iron pyrites, or "fool's gold," is not true gold, for the latter is readily scratched by the blade, while pyrites is not. It is an excellent rule to invariably test the hardness of a mineral before making any other tests.

Streak (q.v.) is of importance with colored minerals and those having metallic lustre. The scarlet streak of cochineal-red cinnabar will instantly distinguish it from cuprite, which has the same color but a brownish-red to blood-red streak. The brown streak of manganite serves to distinguish it from pyrolusite, which has a black streak, while a test of their hardness shows that manganite is 4 and pyrolusite 2 to 2.5. The distinction between gold and pyrite is very marked, gold having a streak of the same color as the mass, while the streak of pyrite is greenish-black. This same greenish-black streak is, however, characteristic of copper pyrites, and its external color is quite similar to that of iron pyrites, but they are readily separated by the superior hardness of the iron pyrites. Such tests as these are not only most convenient in field work, but are at times conclusive. (See MINERALOGY; PHYSICAL CRYSTALLOGRAPHY.)

Cleavage is often an important aid in determinative work. If a lead-gray mineral of metallic lustre shows well-developed cubical cleavage, it may be safely assumed that it is galena. If a transparent mineral cleaves readily into octahedrons of large size, it is almost certainly fluorite. Sphalerite is the only mineral in which dodecahedral cleavage is highly perfect, while the excellent rhombohedral cleavage of calcite instantly distinguishes it from quartz, which it often resembles, and the separation is made conclusive by testing the hardness, which in calcite is 4 and in quartz 7.

Crystal form is one of the most important determinative factors. The characteristic cross twins of staurolite suffice to determine that species, which it would be difficult to recognize if massive. The trillings of cerussite easily separate it from anglesite, whose physical properties are very similar. Many of the zeolites and their common associates are recognized by their crystal form; thus analcite is isometric and generally in trapezohedrons, chabazite is

rhombohedral, apophyllite is tetragonal. The "gridiron" structure of microcline as seen in thin sections under the microscope, which is due to twinning, serves effectually to differentiate it from all of the other feldspars. The importance of a knowledge of crystallography (q.v.) as an aid in determinative mineralogy cannot be overestimated.

Specific gravity is one of the least variable properties of minerals. Its accurate determination, therefore, may be the only test needed to positively identify a specimen. This fact is of immense importance to the jeweler, who constantly resorts to his specific gravity balance as his safest test for precious stones. Gold, too, may be thus identified, for no other yellow mineral has a specific gravity approaching it. Even the rough test of placing the unknown mineral in the palm of the hand and comparing it with about the same quantity of a known species may be suggestive as to the identity of the mineral. Thus rusty-yellow quartz sand may be instantly distinguished from the very similar but much heavier monazite sand.

While the examination of the physical properties of an unknown mineral, as above suggested, is of great value, there is but one way in which its identity can be fixed in all cases, and that is by the use of a series of determinative tables in which the mineral is referred successively from one large group to a smaller, until finally all have been eliminated but itself. The process is based largely on a series of chemical tests which, in almost all cases, give an insight into the character of the material. The scheme involves (1) the heating of a fragment in the forceps; (2) heating in a closed tube; (3) heating in an open tube; (4) heating on charcoal in the blowpipe flame; (5) fusion with fluxes on platinum wire. These processes are described under BLOWPIPE ANALYSIS (q.v.).

While described species may be determined by the foregoing methods, it is at times desirable, and in the case of new species essential, to ascertain the exact proportions of the various ingredients which are present in the mineral; for this purpose it is necessary to resort to a complete quantitative analysis. See CHEMICAL ANALYSIS.

GEORGE LETCHWORTH ENGLISH,
Mineralogist, New York City.

Determinate Problem, a problem in geometry which admits of a limited number of solutions, an indeterminate problem admitting of an indefinite number of solutions.

Determinism, a name applied by Sir William Hamilton to that system of philosophy which holds that the will is not a free agent, but is irresistibly determined by providential motives, that is, by motives furnished by Providence, which turn the balance in our mental deliberations in accordance with its views. Determinism is often mistakenly confused with materialism and atheism. It does not deny moral responsibility though holding a man cannot choose to act in a certain way while he

prefers with his whole nature to act in another way. This doctrine of the necessitarian philosophers expounds in short that whatever happens is entirely determined by antecedent causes.

Detlef, Karl, kārīl dēt'lēf, pseudonym of Klara Bauer, German novelist: b. Swinemünde 23 June 1836; d. Breslau 29 June 1876. Her 'Indissoluble Bonds' (1877) and 'Must It Be?' (1872), are valuable and engrossing studies of character.

Detmold, dēt'möld, Germany, city, capital of Lippe, on the Werra, 50 miles southwest of Hanover. It consists of an old and a new town, the former poorly, the latter regularly built. Its principal edifice is the palace, a fine old castellated building, with a vast round donjon tower. In the vicinity, on the Grotenberg, the loftiest summit of the Teutoburger Wald, a colossal statue, 45 feet high, placed on a solid circular pedestal twice that height, has been erected to the Hermann or Arminius who overthrew Varus and his legions. Pop. 11,542.

Detonating Powder, certain chemical compounds, which, on being exposed to heat or suddenly struck, explode with a loud report, owing to one or more of the constituent parts suddenly assuming the gaseous state. A mixture of equal volumes of chlorine and hydrogen exposed to direct sunlight detonates violently, forming hydrochloric acid gas. The chloride and iodide of nitrogen are very powerful detonating substances. The compounds of ammonia with silver and gold, fulminate of silver and of mercury, detonate by slight friction, by means of heat, electricity, or sulphuric acid. The compound used in the priming of percussion-caps and fuses is the fulminate of mercury or silver, collected as a precipitate when the metal, dissolved in nitric acid, is poured in warm alcohol and then collected, washed, and dried.

Detonators are the devices used in firing high explosives by detonation. They consist of small cylindrical copper tubes closed at one end and charged with mercuric fulminate or a mixture of mercurial fulminate and potassium chlorate which is compressed in the bottom of the tubes. Those used for blasting in mines and quarries are also known as blasting caps and exploders. They are rated as single force, double force, triple force and so on, the charge for the single force cap being about five grains of the detonating substance and the charges for the higher force increasing about two grains for each grade. To fire them a piece of Brickford or "running" fuse of the desired length is inserted in the mouth of the detonator or cap and then the copper tube is bent or "crimped" securely about the sides of the fuse. The detonator is inserted in the bore hole so as to come in close contact with the first cartridge or "stick" of explosive and the bore hole is filled with tamping. When a flame is applied to the end of the fuse that projects from the bore hole, the column of powder in the fuse takes fire, the fire travels slowly down to the charge in the detonator, causing the detonation of the dynamite.

For military mines and naval torpedoes and, to a considerable extent, for commercial blasting, detonators to be fired by an electric current are employed. These are known as electric detonators. They differ from those previously described only in that the mouth of the copper

cap is closed by a plug made of sulphur and ground glass, through which two copper wires, known as the "legs of the detonator," are led. Inside the cap these wires are bridged over by a very fine wire made of an alloy of iridium and platinum. Around the bridge and between it and the fulminating composition is placed a layer of meal gun-cotton. When it is desired "to fire," the legs of the detonator are connected with a dynamo-electric machine and the current generated. As the current passes it heats the bridge to incandescence, which sets fire to the gun-cotton; this causes the fulminate to detonate, and this detonates the charge of dynamite or other high explosives. The electric detonators used in the United States navy contain 35 grains of mercuric fulminate, this large quantity being used to make sure that the detonator will do its share of the work in torpedo attacks on an enemy. See DETONATING POWDER; EXPLOSIVES.

Detritus, applied in geology to accumulations formed by the disintegration of rocks, may consist of angular and sub-angular debris, or of more or less water-worn materials, such as gravel, sand, or clay, or an admixture of these. Especially applicable to that fragmentary matter which if consolidated into a solid would form what is known as breccia.

De Trobriand, dē trō-brā-ān, Philippe Regis, BARON, American soldier: b. Tours, France, 4 June 1816; d. Bayport, Long Island, 15 July 1897. He was educated at the University of Orleans, studied law at Poitiers, and came to the United States in 1841. He was commissioned colonel of the 54th Volunteers in the Civil War 1861; and was appointed brevet brigadier-general in 1867. He was editor and publisher of the 'Revue du Nouveau-monde,' New York, 1849-50, and joint editor of the 'Courier des Etats Unis' 1854-61. Among his works are: 'Les Gentilshommes de l'Ouest' (1841); 'Quatre ans de campagnes a l'Armee du Potomac' (1867).

Detroit (Fr. *détroit*, strait), Mich., capital of Wayne County, in the southeast; largest city of the State, and of the entire Northwest to the Pacific; 13th of the United States; on the northwest bank of the Detroit River dividing the United States from Canada, one end six miles below Lake St. Clair and the other about 14 from Lake Erie. It is 88 miles from Lansing, the State capital; 284 from Chicago; 60 from Toledo, Ohio; 251 from Buffalo; and 291 from Mackinaw. Pop. (1900) 285,704; (1903) about 325,000.

Detroit has the finest harbor on the Lakes; the river, on the city front, is often called "the Dardanelles of America." The broad outlet of Lake St. Clair, running west and dividing around Belle Isle, narrows to about half a mile and deepens to an average of 32 feet for some miles with a southwest course, before turning directly south, with a current of about two miles an hour. Fed by the Great Lakes, it has always a full stream, neither rising nor sinking much, and is little disturbed by storms; and the largest vessels can lie up to the wharves. Here is built Detroit, extending some seven miles along the river front, lined with wharves, elevators, foundries, warehouses, railroad stations, and freight depots, etc.; and about three miles deep, except in the centre, where it is nearly

DETROIT

double. Area, $29\frac{1}{2}$ square miles, but with well-built suburbs outside not yet incorporated; indeed, from Grosse Pointe at the north where Lake St. Clair ends, to Gibraltar at the south where Lake Erie begins, the whole river front for 20 miles is built up with handsome villages, and lined with the summer villas of its wealthy business men, all really part of Detroit. At its southern corner, commanding the channel, is Fort Wayne, an unfinished military post once intended to be the most formidable fortification in the Northwest, and still garrisoned and armed with batteries. Across the river in Canada are Windsor in the centre, the terminal of railroads through Canada, Walkerville on the north and Sandwich on the south.

The ground of Detroit is a gentle slope for 300 or 400 feet back from the river to 20 or 30 feet high; then sinks slightly, and again rises to about 50 feet, and 661 above the sea. The original plan, on a very small scale, was a series of concentric semicircles, or rather segments of polygons, with the Grand Circus—a semicircular park of five and a half acres—as a centre, nearly a mile from the river, toward which they extended. This feature is still preserved; but all the new growth has been laid out in checkerboard system, relieved by a series of noble avenues 100 to 200 feet wide radiating from the river. Jefferson Avenue extends along it; Woodward Avenue runs at right angles to it, dividing the city into halves and the Grand Circus into quadrants; south of Woodward are Michigan and Grand River avenues, at different angles and north is Gratiot. Between the Grand Circus and the river is the Campus Martius, an open space about 600x200 feet, crossed by Woodward and Michigan avenues, and from which start Monroe Avenue, and Fort Street running to Fort Wayne. The streets are generally wide, —50 to 100 feet,—well shaded, and notably clean; some 300 miles of them are paved with brick and asphalt. The chief business street is Woodward Avenue. Jefferson Avenue is another leading one; Griswold Street, with the great banking houses, the custom-house, office buildings, etc., is the Wall Street of Detroit; and others about the Campus Martius are of importance. The chief of the show streets is the Grand Boulevard, a macadamized parkway 150 feet wide and 11 miles long, encircling the heart of the city in a vast sweep from Belle Isle bridge at the east to Fort Street near the western boundary. The outer portions of all the great avenues mentioned, of Lafayette Avenue, and of Fort Street, are full of fine residences; and a notable residence district clusters around Woodward Avenue as it stretches toward Palmer Park.

Public Buildings and Monuments.—The chief of these are on or near the Campus Martius. Within it, facing the city hall, is the Michigan Soldiers' and Sailors' Monument, by Randolph Rogers, of bronze and granite, 55 feet high, with a colossal bronze allegorical statue of Michigan on the summit; it cost \$75,000. On the west, facing four streets, is the city hall, three stories and mansard, of sandstone in the Italian style; 200x90 feet, 66 feet high to top of cornice, 180 to top of tower; it cost \$600,000, and is one of the finest in the West. Near by are the handsome Wayne County court-house, the largest public building in the city, and the splendid Majestic office building. On the north

of the Campus is the Detroit Opera House. The custom-house occupies the old post-office, on Griswold Street, and the magnificent new post-office is on Fort Street, west of the City Hall. The Chamber of Commerce, the Athletic Club, and Y. M. C. A. buildings, the House of Correction, and the magnificent passenger stations,—the Michigan Central, and the new Union station at Fort and Third,—are all conspicuous. The churches will be mentioned later.

Public Service and Improvements, etc.—The city is exceedingly well sewered, and its death rate is very low,—12.03 per 1,000 in 1901. The water supply is taken from a crib in Lake St. Clair, 1,500 feet out, at a depth of 46 feet: the system has over 600 miles of pipes, and has cost above \$6,000,000. It is supported partly by rates, and partly by a city tax. The electric lights are partly arc lights on high towers; there are about 1,800 in all. The electric railway system has over 200 miles of track within the city limits, and over 300 in suburban lines outside to every quarter; and ferries run to Windsor and Walkerville in Canada. There is a bridge over the American half to Belle Isle, but none over the full stream. There are three railway passenger stations,—the Union, the Michigan Central, and the Brush Street, all on the water front not far apart. The fire department has 27 steam fire engines, 6 chemical engines, 10 hook and ladder companies, 6 supply wagons, 2 fire boats, and a water-tower; besides reserve engines, etc. There are 434 fire-alarm boxes and 3,427 hydrants. The police system has seven precinct stations and six sub-stations, a signal office, and a harbor-master.

Parks, Pleasure Resorts, Public Amusements, etc.—Detroit has 21 public parks; besides a number of small triangular squares caused by the intersection of the radiating avenues with the streets, often with fountains. The largest, and the principal public resort, is Belle Isle in the river, whose entire 707 acres have been parked with great beauty at a cost of over \$1,500,000, including a ring of little lakes and canals. It is reached by a handsome iron bridge built in 1889, at a cost of \$315,000; and is to be increased 100 acres by taking in the southwestern shoals. The next largest is Palmer Park, of 141 acres, on Woodward Avenue, about $6\frac{1}{2}$ miles from the river, sedulously made a colonial museum; it has a colonial log house, and a most interesting collection of colonial and other historical relics, besides a colonial casino. Clark Park in the west has about 25 acres; Voigt Park $8\frac{1}{2}$; and the Grand Circus, in each of whose quadrants made by Woodward Avenue there is a fountain, $5\frac{1}{2}$ acres. Besides these, there are opportunities for delightful summer trips on the river and lakes; and the river is dotted with charming places where excursion steamers run, from Grosse Pointe, on Lake St. Clair, famed for its cherry orchards, to Grosse Isle where Lake Erie opens. There are nine theatres and opera houses in the city, the largest of which are the Detroit and Whitney's opera houses, and the Lyceum. The finest cemeteries are Elmwood (Protestant) and Mt. Elliott (Catholic) side by side on the north-east, about two miles from the centre, beautiful in keeping and monuments; and Woodmere, some four miles to the southwest on high ground, is another beautiful one. Woodlawn,

2. Belle Isle Park; The Grand Canal.

DETROIT

a new and beautiful cemetery just opened, situated seven miles out Woodward Avenue, and Mt. Olivet, another large (Catholic) cemetery about seven miles out at the northeast. There are a number of Lutheran and Jewish cemeteries.

Schools, Libraries, Newspapers, etc.—In 1902 the public school system had 72 buildings, 66 brick and 6 wood, besides a central office building; and 3 high schools. There are, in addition to the above, 56 private schools in the city. Total number of teachers employed, 1,288; total number of children of school age, 83,215; total number of children attending school, 51,554; and the expenditures were \$1,286,708. There is no Protestant nor non-sectarian institution for general higher education, the University of Michigan at Ann Arbor being only 37 miles away; but the Jesuits have Detroit College, opened 1877. There are also several special professional colleges: three medical, including the Detroit College of Medicine, with schools of pharmacy and dentistry, and Michigan College of Medicine and Surgery, Detroit Homeopathic College, and the Detroit College of Law. There are 82 periodicals, including 7 dailies, 2 of which are German. The one great library is the Detroit Public Library, opened 1865, containing nearly 200,000 volumes, and with branches in each high school as well as several outside. But Andrew Carnegie has offered to give \$750,000 for a library, if the city will expend \$75,000 a year in its support; the offer has not been accepted. The Hurlbut Library at the waterworks is also utilized as a distributing station. The Bar Association has a law library; and the Masonic lodges, the Trades Union Council, and the Museum of Art have also libraries. The latter institution, in part supported by a city tax, has a good collection of historical and archæological, art, and scientific relics and examples, valued at \$300,000. These include the Stearn's Oriental collection, one of the finest in the country, and the Scripps gallery of old masters.

Churches and Charities.—In 1902 there were 200 religious societies in Detroit. The chief denominations were Roman Catholic (36 churches including the cathedral, it being the seat of a bishop), Methodist Episcopal (29), Lutheran (26 of different synods), Baptist (18), Presbyterian (15), German Evangelical (11), Congregational (10). There were also five Jewish synagogues and a temple; and several Catholic convents. Of the church buildings, the largest is the cathedral. Architecturally may be noted Ste. Anne's, and the Convent of the Sacred Heart, on Jefferson Avenue (both Catholic); the First and Fort Street Presbyterian; the Central Methodist; Trinity, St. John's, and Christ (Episcopal); Woodward Avenue Baptist; Church of Our Father (Universalist); First Unitarian; and the Temple Beth El.

The charities include a city poor fund, managed by a commission; and the Detroit Associated Charities. There are four large general hospitals, of which the most noted are Grace and Harper, with training schools for nurses; St. Mary's (Catholic) and the United States Marine Hospital. Besides these are some two dozen allied institutions,—lying-in hospitals, homes for Magdalens, foundlings, and orphans, the aged; etc. The House of Correction, whose buildings, grounds, and appliances have cost some \$600,000, is of world-wide note.

Commerce and Industries.—Detroit is a highway through which passes all the commerce between the upper and lower lakes, to the volume of probably 50,000,000 tons yearly, or more than double that of the Suez Canal. It is the terminus of a great number of lake steamer lines, freight and passenger, and a chief calling point for others; and one of the greatest distributing points both by boat and rail between the United States and Canada, with which it does three fourths of its "foreign" trade. In 1902 its exports were \$18,053,055, greatest of all the ports opposite Canada; and its imports \$3,469,077. Of the really foreign trade, extra-continental, the greater part is to England. The exports are grain and flour, swine and their products, cattle, beef, and hides, sheep and wool, and lumber; though the latter trade has greatly declined of late years, as the Michigan pine forests have been stripped. Besides this, it receives and uses or ships east vast quantities of the produce of Michigan, of which it is the natural emporium; wheat, corn, and barley, hops, apples, dairy products, etc., besides those above mentioned. Its annual clearances of vessels are about 3,300, with a gross tonnage of over 500,000. It has the largest dry-dock on the lakes. Besides the water lines, it is the centre of seven great railroad lines, most of them among the chief trunk lines of the West and Canada; the Lake Shore, Michigan Central, Grand Trunk, Canadian Pacific, Pere Marquette, Wabash, and Detroit Southern.

The manufactures of Detroit in 1900 turned out \$100,892,838 in finished product, employing \$71,751,193 of capital and over 51,000 workmen and officials, and paying nearly \$24,000,000 in wages and salaries. The increase from 1890 was 63 per cent in number of establishments, and 30 per cent in value of product: a healthy sign, indicating greater diversity of industries and development of medium businesses. There is a large employment of skilled labor, as in optical goods (\$225,000), professional and scientific instruments, etc. The greatest single item was in foundry and machine-shop products, \$8,943,311; but if we add the allied industry of making the iron and steel itself—over \$3,000,000,—the steamfittings and heating apparatus, and the architectural iron-work, the general iron and steel manufacture will come up to nearly \$15,000,000. Next to this is the manufacture of tobacco products, amounting to over \$6,500,000. Manufacturing chemicals and druggists' products is the third immense specialty, \$4,915,913, the creation or the past 20 years almost wholly. Malt liquors come next. Furniture and carriages, using more skilled work to less stock, have largely supplanted the coarse lumber and planing-mill work once a chief industry. Brass castings are a heavy item; slaughtering and meat packing is important; and paints and varnishes occupy a prominent position.

Government, Finance and Judiciary.—The city is divided into 17 wards. The city council has but one chamber, and the council and the mayor are elected for two years. Most of the officials and commissions are elected; some are appointed by the council on the mayor's nomination; and the board of health is appointed by the governor of the State. The finances are regulated by a board of estimates. The city is the seat of the United States circuit court

DETROIT—DEUS EX MACHINA

for the sixth circuit, the district court for the eastern district of Michigan, the Wayne County circuit court, and local courts. The principal officials of the Lake Survey and the department in charge of the lake lighthouses have their offices here. The city's limit of borrowing is 2 per cent of its assessed valuation; which was about \$250,000,000 in 1902. The tax rate was 2.13, and the amount raised \$5,822,819.44. The net debt was \$3,563,908.74. The banks of the city on 15 July 1901 consisted of 8 national, 14 savings banks, 2 trust companies, and 2 private banks. The joint-stock banks reported \$96,553,247 resources, \$7,850,000 capital, \$2,076,000 surplus, and \$80,221,322 deposits.

Population.—Detroit's figures since the first census taken 1820, are as follows: 1820, 1,422; 1830, 2,222; 1840, 9,102; 1850, 21,019; 1860, 45,619; 1870, 79,577; 1880, 116,340; 1890, 205,876; 1900, 285,704. Of these, 189,201 were native born; 96,503 foreign; 4,111 were colored. The total of foreign and those with foreign-born parents was 184,892; and the native white population of native parentage was but 61,309. But as about 32,000 of the foreign-born were English of England or Canada, and others from Scotland, Ireland, etc., the English element is about 100,000.

History.—The white man first visited Detroit, so far as records show, about 1655, and the first map of the region was published in 1656. The first settlement was made 24 July 1701, by Antoine de la Mothe Cadillac (q.v.), who had been governor of Michillimackinac, and wished to establish a permanent post for the centre of French power and commerce in the Northwest. He built Fort Pontchartrain, and settled it with 50 soldiers and 50 colonists. At the close of the French and Indian war, on 29 Nov. 1760, Maj. Robert Rogers took the place from the French commandant, Capt. Beletre, by order from the Marquis of Vaudreuil; the garrison were sent off as prisoners, but the Canadian inhabitants were allowed to retain their farms by swearing allegiance to the British crown. The first act of Pontiac's conspiracy in 1763 was to attempt seizing Detroit; but he was foiled, and after a desperate siege from 9 May to 12 October, heroically sustained by Maj. Gladwyn, the post was relieved, alone of all the western forts. In 1778 there were about 300 inhabitants, living mostly in log cabins, with a Roman Catholic Church; in that year the British built Fort Lernault, renamed Fort Shelby by the Americans on obtaining it, which was not till 1796. As part of the Northwest Territory, it came under the Ordinance of 1787, and in 1802 was incorporated as a town, but in 1805 was obliterated by fire except two buildings. It was rebuilt, and became the capital of Michigan Territory. In the War of 1812, William Hull surrendered it to the British under Isaac Brock on threat of a general massacre of the inhabitants by Brock's Indians. Hull was court-martialed for this act. The British, however, evacuated it the next year, and the Americans reoccupied it 29 September. It was incorporated as a village in 1815 and as a city in 1824. It remained the capital of the Territory till 1837, when Michigan became a State; then of the new State till 1847. Detroit celebrated its centennial 24 July 1901. Consult: Farmer, 'History of Detroit and Michigan' (1889), and 'Detroit' in 'Historic Towns of

the Western States' (1901); Burton, 'Cadillac's Village' (1896); Parkman, 'Conspiracy of Pontiac' (1867); 'Landmarks of Detroit,' Ross and Catlin (1898).

C. M. BURTON.

Author and Historian.

Detroit, Minn., county-seat of Beaker County; on Detroit Lake, and the Northern Pacific Railroad; about 200 miles northwest of St. Paul. The town is the trade centre of a rich agricultural district, and a popular summer resort because of its situation in the beautiful lake region of Minnesota. Pop. (1900) 2,000.

Detroit River, a river or strait which connects Lake St. Clair and Lake Erie, and forms part of the boundary between the United States and Canada. *Detroit* is the French word for strait; and the name was given by the French, the first white men who settled here. Its course is nearly south, with slow current, and sufficient depth of water for the navigation of large vessels. It is 25 miles long and three fourths of a mile wide opposite the city of Detroit, where it forms an excellent harbor. The tonnage passing through this river exceeds in volume that passing through any other river in the world.

Dettingen, dēt'ting-ën, Germany, the name of several places in Germany, but the only one particularly deserving of notice is a village of Bavaria, on the Main, nine miles northwest of Aschaffenburg. It is noted for the victory gained in 1743 by the English and Austrians under George II. of England over the French under Marshal Noailles, in the war of the Austrian succession.

Deucalion, dē-kā'li-ōn, in Greek mythology, father of Hellen, ancestor of the Hellenes or Greeks, was the son of Prometheus and was king of Phthia. The following is the myth with which his name is connected. Zeus, it is said, determining to destroy mankind by water, on account of their impiety, brought a flood upon the earth, by means of a violent rain; Deucalion saved himself and his wife Pyrrha by building a wooden vessel which floated safely to the top of Mount Parnassus. After the flood had subsided they consulted the oracle of Themis to know what they must do to repair the loss of mankind, and were directed to veil their faces and throw behind them the bones of their mother. Understanding their mother to signify the earth, and her bones the stones, they did as the oracle directed. The stones thrown by Deucalion became men and those thrown by Pyrrha became women.

Deus, Joao de Rogueira Ramos, zhō-ōwñ roo-jā'rā rā-mōsh dā dā-oosh, Portuguese lyric poet: b. Sao Bartolomeu de Messines, province of Algarve, 8 March 1830. He is regarded by his countrymen as introducer of a new era of Portuguese poetry. National spirit, originality, sensibility, and rhythmic melody characterize his poems. They are published in 'Field-flowers' (1870); 'A Branch of Blooms' (1870); etc.

Deus Ex Machina, dē-ūs ěks māk'i-nā ('a god out of the machine'), a Latin phrase used to designate some unknown supernatural cause introduced to explain phenomena that one is not able to account for by natural means; or applied to some extraordinary and unlooked-for agency introduced to solve a difficulty or the like. The phrase is taken from the practice

in the Greek and Roman theatres of introducing a god from above by means of some mechanical contrivance whenever it was necessary to cut some dramatic knot which could not be loosed by the human actors.

Deuteronom'y (Gr. *deuteronomion*, the duplicate law, or duplication of the law, from *deuteros*, "second," and *nomos*, "a law"), the last of the books of the Pentateuch, so called from its consisting in part of a restatement of the law as already given in Exodus, Leviticus, and Numbers. It contains also, in addition to special commands and admonitions not previously given, an account of the death of Moses. This book presents the third and latest phase of the development of the Mosaic legislation. Its great aim is to check the encroachments of idolatry, and to concentrate the national worship in the great sanctuary at Jerusalem, especially at the three annual festivals. It is instinct with the prophetic spirit, and lays stress on the great commandment to love and fear God with the whole heart as the sum of the law. It is supposed by many critics that the book of the law found by Hilkiah, the high priest, in the house of the Lord during Josiah's reign (II. Kings xxii. 8-13) consisted of the larger portion of Deuteronomy. It may be divided into (1) four parting addresses of Moses to the Israelites in the plains of Moab, ch. i.-xxx.; (2) the charge to Joshua and to the priests, with the commitment of the book of the law to the keeping of the latter, and his song, xxxi.-xxxii. 47; and (3) three appendices, namely, (a) announcement to Moses of his approaching death, xxxii. 48-52, (b) the poem conveying his blessing on the tribes of Israel, ch. xxxiii., and (c) an account of his death, ch. xxxiv. The authorship of this book has been traditionally assigned to Moses, with the exception of the few concluding verses which narrate his death, and which by many of the conservative school of theologians have been ascribed to Ezra. Of late years much critical labor has been bestowed on this and the four preceding books, constituting the Pentateuch, and the Mosaic authorship of the whole has been both assailed and defended with considerable learning and ability. See PENTATEUCH.

Deutoplasm. See EMBRYOLOGY.

Deutsch, doich, Emanuel Oscar Menahem, German Orientalist: b. Neisse, Silesia, 28 Oct. 1829; d. Alexandria, Egypt, 12 May 1873. His education was obtained at the University of Berlin and in 1855 he went to England to fill an appointment in the library of the British Museum, where for 15 years he studied and wrote. He is best known by his brilliant article on the 'Talmud' in the 'Quarterly Review' (1867), to which he also contributed an article on 'Islam' (1869). He was a valued contributor to the first edition of Chambers' 'Encyclopædia,' for which he wrote nearly 200 articles. A volume of his 'Literary Remains,' with sketch of his life was published in 1874.

Deutsch, Gotthard, American Hebrew scholar: b. Kanitz, Austria, 31 Jan. 1859. He was graduated from the University of Virginia in 1881. He is professor of Hebrew at Union College, Cincinnati. Besides his scholarly works, 'Symbolik in Cultus'; 'Theory of Oral Tradition'; and 'Philosophy of Jewish History,' he has published 'Andere Zeiten,' a novel.

Deutz, doits, Prussia, town in the province of the Rhine, on the river Rhine, opposite the city of Cologne, with which it is now incorporated. It is connected with Cologne by a bridge of boats 1,400 feet long. It is strongly fortified, as part of the defenses of Cologne — forming, in fact, a tête-du-pont. Deutz is a very ancient place, and is said to owe its origin to a castle built on its site by Constantine the Great. Pop. 17,782.

Deutzia, doit'sī-a or dūt'sī-a (so named in honor of the Dutch botanist Deutz), a genus of plants of the natural order *Saxifragaceæ*, containing seven or eight species, all of which are interesting for the beauty of their flowers. Some of the species are cultivated in America as hothouse flowers, or ornamental shrubs. The nearest relatives growing wild in the United States are the syringas. The deutzias are small shrubs indigenous to China and Japan, and northern India. They are covered with stiff, stellate hairs, on which account one species (*D. scraba*) is used by joiners in Japan to polish wood. The flowers are arranged in thyrsi like the lilac.

Deux-ponts, dê-pôn, the French name for the German town of Zweibrücken, in Latin *Bipontium*, all which names signify two-bridges. There was formerly a county of this name, which took its name from this town, which is now in the Bavarian Palatinate. It was afterward erected into a duchy. By the Peace of Lunéville (1801) the duchy was ceded, with all the left bank of the Rhine, to France, and afterward composed a part of the department of the Donnersberg. It contained 70,000 inhabitants, on 760 square miles. By the peace of 30 May 1814 it was restored to Germany. See ZWEIFRÜCKEN.

Deva, dā'va (Lat. *deus*, *divus*), among the Aryans in general, an epithet of divine persons and things; hence often opposed to the *dev* of the Parsees. It is commonly applied to the goddess Durgā, the wife of Siva, of terrific form and irascible temper. Devakātmajā is the mother of Krishna, who is also named Devākī. Devatarū is the holy fig-tree, belonging to Sverga or paradise. Devatā denotes a deity; Devadatta, the younger brother of Buddha, who is called Devadattārāja (Deodatus senior). Devadeva is a name of Brahma; Devapati is Indra, the god of the sky; Devayajna is the Homa or burnt sacrifice; Devarishi a celestial saint. There are a great many classes or choirs of inferior devatās, who are ministers to the higher gods, such as the 12 Adityas or forces of the sun; the Maruts or winds, the celestial musicians; in short, endless motley hosts with variable attributes. See BRAHMA.

Devanāgarī, dā-va-nā'ga-rē (lit. "town-script of the gods"), the character most widely understood by Hindu scholars, in which Sanskrit works are usually printed, unless when in Roman letters. See SANSKRIT, ALPHABET.

Devaprayaga, dā-vā-prā-yā'gā, or **Deoprayag**, India, a sacred city of the Hindus, in the district of Garhwal, Northwest Provinces, on a mountain side, 2,266 feet above the sea, in the fork of the Alaknanda and the Bhagirathi, which join to form the Ganges. Devaprayaga possesses a notable temple, and is a favorite place of pilgrimage.

DEVELOPING IN PHOTOGRAPHY — DEVELOPMENT HYPOTHESIS

Developing in Photography. See NEGATIVES, DEVELOPMENT AND TREATMENT OF.

Development, when joined with the word theory has often been used as a synonym for the term evolution, to denote the slow and gradual process by which, according to natural laws, animals and plants have passed from lower and simpler forms to higher and more specialized organisms. When used alone the word is employed in biology to signify the successive and more rapid changes which plants and animals undergo in passing from the embryo to the adult stage of individual life. This restriction is here observed in treating of development in animal life illustrated by examples shown in the accompanying plate. The changes taking place in the egg, or in the foetus within the body of the parent, are described under EMBRYOLOGY.

After leaving the egg stage, or having been separated from the body of its parent, the animal is either complete in its organization, like the parent, or it passes through successive larval stages before it reaches the perfect form of adult life. A remarkable fact about the larval stages is that the organs are adapted to the necessities of each change in the development, so that the young may live to perpetuate the species, even though the parents die. Familiar illustrations of these transformations are recognized in the youthful period of butterflies and bees. But there are lower grades of animal life, in which the metamorphoses of the young are no less striking.

Among the crinoids, of the branch *Echinodermata*, which includes the starfish, is a genus lily-like in appearance which, as soon as the embryo is hatched from the egg, consists of little more than a mouth surrounded by hair-like processes called cilia. These delicate organs resemble eyelashes and are the forerunners of legs, fins, and wings in animals of more advanced types. In the young crinoid they are used for swimming and for drawing food into the mouth. Within a few days after it is set free in the water, this larva develops a calcareous stem surmounted with a cup or calyx and attaches itself to some object on the sea bottom. Soon afterward the calyx opens and expands like the sepals of a flower; long, arm-like tentacles grow out; the stem breaks off, and the adult crinoid becomes again a free swimmer. (See Plate 6, 6a.)

Higher in the scale of animal life, in the class *Crustacea*, are the *Cirripeds* (curly-hair-footed) or barnacles. The adult is covered with a head-like shell, within which are contained the organs—the digestive apparatus, the double eye, and the numerous feet. Some barnacles by a fleshy peduncle attach themselves to a rock or to the bottom of a ship; others are attached by their sucking antennæ. In this sessile or stalked condition the barnacle opens its shell, and by the vibration of its feet captures its food, or again closes its shell to avoid danger. But after the hatching of the embryo, the larva, floating in the water, has but three pairs of feet, a pair of horns, a single eye, and a shield covering the back. This is known as the *nauplius* stage. After several moults, each accompanied by a change of structure, it enters the *Cypris* stage. The bivalve shell replaces the larval shield, and seven pairs of appendages are added. This free-swimming stage is of short

duration, and the animal fastens itself to some fixed object or to a sailing vessel. (3, 3a.)

The inhabitants of the water, like those of the land, are often infested with parasites. Of these the crustaceans furnish a large number. These enter as unwelcome guests the bodies of starfishes, ascidians (4b), and of many other sea animals. They inhere in the skin of fishes and cetaceans, or like the cirriped, the peltogaster, attack the unprotected part of the hermit crab. The larvæ of these pests quit the egg in the partly developed stage of *nauplius*, and through numerous moultings reach the adult form. The female often surpasses the male in the number of these changes, and is the larger of the two. (5, 5a.) Passing to the Crustacean Decapoda—the shrimps, lobsters, crayfish, and hermit crabs—the embryo stage of development is much more advanced than that of any other of the groups already mentioned. These long-tailed crabs are characterized by 20 segments of the body, and 19 pairs of appendages. The embryo-shrimps break the egg in a more complete form known as *zoea*—a stage which includes the carapax and the first four pairs of appendages. A second stage produces the five pairs of locomotive feet attached to the thorax, and the six pairs of egg-supporting feet joined to the abdomen. (2, 2a, 2b.)

Among the lowest forms of *Vertebrata* are the class *Elasmobranchii*, including sharks and skates. Interest in these animals is directed to the difference between their appearance and their structure. They look like fishes, but they are not strictly such. Their skeletons are not bony, but are cartilaginous. While the form of the adult points forward to the teleosts, or true fishes, the young shark, as the dogfish, and the young skate, as the torpedo, both in their form and structure point back to the higher invertebrates, the shrimps and crayfish. In form and in swimming organs these larvæ are similar and suggest the lower kinship. Yet the one develops into the elongated body of the dogfish with ordinary-fish like pectoral fins (8, 8a), and the other changes into the broad, flattened shape of the torpedo, with exaggerated pectoral fins scarcely distinguishable from the body (7, 7a).

In the sub-class *Teleostei*, or perfect-bone fishes, the group of *Heterosomata*, or flatfishes, including the English turbot and plaice, and the American halibut and flounder, present striking changes in development. At the stage of birth, and for some time afterward, the young show the bilateral symmetry common to other teleost tribes, swimming with their broad side vertical, an eye on each side. Gradually there is a tendency to lean to one side, which increases; the skull twists the other way, the under eye goes with the head, until a complete readjustment has been effected, and the fish swims with its flat surface parallel with the sea bottom and with its two eyes looking upward. (1, 1a, 1b.)

Development Hypothesis, in biology, the hypothesis or theory that species were not each of them a separate creation, but by some process, or other came from previous species, the only exception, if any, in existence, being one or more primordial forms. By a similar process, arose also the greater differences of structure, according to this theory, which distinguish genera, families, orders, classes, and even higher

DEVENS—DE VERE

groups. Man comes into the world as an infant, and bodily and mental development, operating by means of changes so gradual as to escape notice at the time, make that infant successively pass through childhood, youth, and so on to full maturity. Growth, still continuing, is now less apparent than before, and finally counter causes arrest and overcome it and induce decline.

Similarly, plants grow from seeds; the oak being ultimately produced by the acorn. Thus development is the law of the individual, both in the animal and in the vegetable kingdom. Among the several races of mankind there is a tendency toward progress from a less to a more civilized state, which again is development in another form. If it is manifested in the individual and in the human, if not even in all species, the inquiry, according to the upholders of this theory, is inevitable. May it not also operate in the various genera, families, orders, etc.? May not the more highly organized animals and plants have in some way been developed from the lower ones, and the time-honored view that species—each of them a separate creation—are so nearly constant that they can run only into varieties, require modification?

Buffon, in a vacillating way, believed in the transformation of species. Lamarck strongly contended for the same view, first publishing his opinions on the subject in 1801; stating them at greater length in 1809 in his *Philosophie Zoologique*, and in 1815, in the introduction to his *Hist. Nat. des Animaux sans Vertèbres*. He maintained that all species, man himself not excluded, had descended from other species existing at a prior time. As early as 1795 Geoffroy Saint-Hilaire suspected that all known species are degenerations of one primitive type; he did not, however, publish his views till 1828. In 1844 appeared a work called *Vestiges of the Natural History of Creation*, which by 1853 was in its 10th edition, and strongly advocated the development hypothesis. Many replies to this work were given, the most celebrated being Hugh Miller's *Footprints of the Creator*; or, the *Asterolepis of Stromness*. The eminent metaphysician, Herbert Spencer, in an essay which appeared in the *Leader* in March, 1852, and republished in his *Essays* in 1858, contrasted the theories of special creation and development, and intimated his belief in the latter.

The last-named year began a new epoch in the history of the development hypothesis; 1 July 1858, a paper was read by Dr. Alfred Wallace, and another by Charles Darwin, on *'Natural Selection'*, a modification of the development hypothesis, to which each had come independently; the former on observation and reflection while studying the natural history of the Malay Archipelago, the latter by a powerful and long-continued consideration of the phenomena of organic life which he had witnessed during his voyage round the world in the Beagle surveying vessel from 1832 to 1836. This is the form in which the development hypothesis now flourishes. Darwin's celebrated book, *'The Origin of Species'*, first appeared in 1859, and his *'Descent of Man'* in 1871. Dr. Wallace's work on *'Natural Selection'* came out in 1870. One of the earliest converts to the new doctrines was Prof. Huxley, who has done an immense deal to defend them and render them popular. In Germany the same views are

earnestly advocated and carried out to an extreme length by Prof. Haeckel in his *'History of Creation'*, published in 1873, and of which an English translation appeared in 1875. What was formerly termed development, and sometimes more vaguely the transmutation of species, is now often called evolution. See DARWINIAN THEORY.

Dev'ens, Charles, American jurist and general: b. Charlestown, Mass., 4 April 1820; d. Boston, Mass., 7 Jan. 1891. He was educated at Harvard, and was United States marshal for the district of Massachusetts at the time when the case of Thomas Sims, a fugitive slave, attracted widespread attention. Devens delivered Sims to his master in accordance with the law, and afterward tried to purchase his freedom, but did not succeed till after the outbreak of the Civil War. He served in the Union army from 1861 to 1865, retiring with the full rank of brigadier-general and the brevet rank of major-general. In 1873 he was made associate justice of the Massachusetts supreme court; in 1877 became attorney-general of the United States; and in 1881 resumed his place on the Supreme bench of his native State.

Deventer, dă'vên-têr, or Demter, Holland, an old town in the province of Overijssel, eight miles north from Zutphen, on the navigable river Yssel. It has a large town-hall, a court-house, and prison, places of worship for Calvinists, Lutherans, Mennonites, Roman Catholics, and Jews. The Groote Kerk has a fine Gothic tower and a crypt dating from the end of the 11th century. The followers of Gerard Groot, or "the Brethren of the Life in Common," have their college here. Deventer is famed for its "honey-cakes," a kind of gingerbread.

De Vere, de vēr, SIR AUBREY HUNT, Irish poet: b. Curragh Chase, Ire., 28 Aug. 1788; d. there 5 July 1840. His works are: *'Julian the Apostate: a Dramatic Poem'* (1822); *'The Duke of Mercia: an Historical Drama'*, the volume containing also *'The Lamentations of Ireland'* (1823); *'The Song of Faith, Devout Exercises, and Sonnets'* (1842); and *'Mary Tudor: an Historical Drama'*, published posthumously (1847). His sonnets Wordsworth declared to be "the most perfect of our age."

De Vere, Aubrey Thomas, Irish poet and essayist: b. Curragh Chase, Ireland, 10 Jan. 1814; d. there 21 Jan. 1902. He was a son of Sir Aubrey De Vere (q.v.), and became a Roman Catholic in 1851. In 1842 his first volume of verse appeared, *'The Waldenses'*, and *'The Search after Proserpine'* (1843). His subsequent books of verse include: *'Poems, Miscellaneous and Sacred'* (1853); *'May Carols'* (1857); *'The Sisters'* (1861); *'The Infant Bridal'* (1864); *'Irish Odes'* (1869); *'The Legends of St. Patrick'* (1872); *'Alexander the Great'* (1874); *'Legends of the Saxon Saints'* (1879); *'The Foray of Queen Meave, and other Legends of Ireland's Heroic Age'* (1882); *'Legends and Records of the Church and the Empire'* (1887); and *'St. Peter's Chains'* (1888). Among his prose works are: *'English Misrule and Irish Misdeeds'* (1848); *'Picturesque Sketches of Greece and Turkey'* (1850); *'Ireland's Church Property and the Right Use of It'* (1867); *'The Church Establishment of Ireland'* (1867); *'Constitutional and Unconstitutional Political Ac-*

DE VERE — DEVIL-WORSHIP

tion' (1881); 'Essays, Chiefly on Poetry' (1887); 'Essays, Chiefly Literary and Ethical' (1889); 'Recollections of Aubrey de Vere' (1897).

De Vere, Maximilian Schele, American philologist: b. near Wexiö, Sweden, 1 Nov. 1820; d. 1898. He came to the United States in 1843; and in 1844 became professor of modern languages and belles-lettres in the University of Virginia. His works include: 'Outlines of Comparative Philology' (1853); 'Stray Leaves from the Book of Nature' (1856); 'Studies in English'; 'Glimpses of Europe in 1848'; 'Romance of American History'; 'Wonders of the Deep'; etc.

Dev'eron, a river of Scotland, in Aberdeenshire and Banffshire, which flows into the sea at Banff. It is about 50 miles long. The salmon-fishery is very valuable.

Devi, *dā'vë*, in Hindu mythology, "the goddess," or Mahadevi "the great goddess," wife of the God Shiva and daughter of Himaviti (that is, the Himalaya Mountains). She is represented as a being of two characters, one gentle, the other fierce, and it is under the latter aspect that she is generally worshipped. In the Mahabharata she appears under many forms, and her individuality is fully developed in the Puranas.

Devia'tion, in the law of marine insurance, an unnecessary departure from the course of the voyage insured. The legitimate reasons for departure from the course are stress of weather, want of repairs, joining convoy, succoring ships in distress, danger from an enemy, sickness, and mutiny. Even in these cases the quickest courses must be taken. Deviation, from the moment at which it commences, discharges the underwriter from all liability.

Deviation of the Compass, the deviation of a ship's compass from the true magnetic meridian, caused by the proximity of iron. In wooden ships no magnetic deviation is perceptible so long as the ship is heading north or south. The greatest deviation is seen when the vessel heads east or west. In iron ships the magnetism is fixed by hammering and riveting, and the deviation manifests itself exactly in accordance with the point toward which the hull headed while these processes were going on. Armor-plated ships should be plated with their head in a different direction from that in which they lay when built. The mode now generally employed to correct deviation is by introducing on board ship masses of iron and magnets to exactly neutralize the action of the ship's magnetism. Compasses are sometimes carried on masts as a means of removing them from the disturbing influence of the iron of the hull. In this position they serve as standards of comparison for the binnacle compass. Wooden ships are also magnetized, so as to affect the compass, though in a far less degree, by the direction in which they lie when building.

Devil (O. E. *deofol*; O. S. *diubal*; O. H. G. *tiufal*; M. G. *Teufel*; Gothic, *diabolus*, from Gk. *διάβολος*, a slanderer), an evil spirit, Satan, the tempter, slanderer, and tormentor of human beings, according to the Scriptures of the Old and New Testaments. Most of the old religions of the East acknowledged a host of demons not good or bad, but merely exercising a salutary or injurious influence. In the latter case they

were looked upon as punishing spirits, without inimical or wicked purpose. Siva, the judging and destroying god of the Indian mythology, is a symbol of the great power of nature, which is alternately beneficent and injurious, but in itself neither good nor evil. Zoroaster named this evil principle *Ahriman*. The Greek mythology did not distinguish with the same precision between the good and bad spirits. Beelzebub, or Beelzeboul, appears to have been regarded by the Jews as the prince of the devils. According to the Mohammedans, who have derived their account from Jewish traditions, the devil, or, as they sometimes call him, *Eblis*, was an archangel, whom God employed to destroy the *jinnis* or genii, a race intermediate between men and angels, who tenanted the earth before the creation of Adam.

The Satan ("adversary") of the New Testament is a rebel against God. Endowed with the intellect and power of angels, he uses them since his fall to entangle men in sin, and obtain power over them.

The doctrine of Scripture on this subject soon became blended with numerous fictions of human imagination, with the various superstitions of different countries, and the mythology of the pagans. The gods of the ancients became evil spirits, seeking every opportunity to injure mankind. The excited imaginations of people frequently led them to suppose Satan visibly present; and innumerable stories were told of his appearance, and his attributes distinctly described. The writings of the fathers of the Church also contain several passages respecting the appearance of the devil. In many works or appearances of an extraordinary character, the devil was supposed to be concerned. Thus, many a dam, bridge, etc., has been built in one night with his assistance, and everyone knows that superstitious writers of former days, applying the legends that had become connected with Dr. Faust, the reputed worker of magic, to Fust, to whom the invention of printing has frequently been ascribed, taught that he invented the art by the help of Satan.

Devil-fish, huge rays of the family *Mantida*, which have a lozenge-shaped disk broader than long, with the head free from the pectoral fins and provided with a pair of anterior processes, and the tail long and whip-like. The two genera and six or seven species are confined to warm seas. So far as known, the young are produced alive after the eggs have hatched within the oviduct. The best known species are *M. birostris*, sometimes called the blanket-fish by tropical American pearl-fishers, from their belief that it attacks and devours men after enveloping them in its great wing-like pectoral fins, which reach a breadth of 20 feet. It is common in tropical American waters, and occurs on both the Atlantic and Pacific coasts of the United States. The name also applies to the *Octopus* and allied eight-armed *Cephalopoda* (qq.v.).

Devil-worship, the worship paid to the devil as a malignant deity, or the personified evil principle in nature, by many of the primitive tribes of Asia, Africa, and America, under the assumption that the powers of evil are as mighty as the powers of good, and have in consequence to be conciliated. There is a sect

DEVIL'S ADVOCATE—DEVISE

called Devil-worshippers, or Yezidees, inhabiting Turkish and Russian Armenia and the valley of the Tigris, and numbering more than 200,000. They venerate the authority of the Old Testament above that of either the New Testament or the Koran. They practise both infant baptism and circumcision, and have a religious ministry of four orders. Their Christian ideas have reached them through Gnosticism. They pay respect to the devil, to Christ, and to Allah or the supreme being, and also worship the sun.

Devil's Advocate. See *ADVOCATUS DIABOLI*.

Devil's Arrows, three Druidical stone obelisks set up, probably as landmarks, near Boroughbridge, Yorkshire, England.

Devil's Bible, The, the popular name of a manuscript Bible written on ass-skin. The name arose from a legend that the writing was the work of a man who by the Devil's help accomplished it in a few hours in order to save his life, but who in return became the slave of the Evil One.

Devil's-bit, the common name of a species of scabious (*Scabiosa succisa*), of the natural order *Dipsacæ*. It has nearly globular heads of blue flowers, ovate leaves, and a fleshy root, which is, as it were, cut or bitten off abruptly. In America devil's-bit is one of the common names of *Lacinaria spicata*, which is known as dense button snakeroot, gay feather, backache-root, colic-root, etc. It belongs to the *Compositæ*, and is found in moist soil from Massachusetts to Florida and westward to Wisconsin and Louisiana.

Devil's Bridge, (1) an ancient bridge in Cardiganshire, Wales; it crosses the ravine through which flows the Mynach. (2) A bridge in Switzerland, crossing the Reuss, on the road over St. Gothard, from Germany to Italy.

Devil's Coach-horse (*Deypus oleus*), a common British and European beetle, belonging to the family *Staphylinidæ*. It has very much reduced wing-covers, and like many of its relatives has the habit of curving its body upward, to adjust the wings under their covers.

Devil's Darning-needle. See *DRAGON-FLY*.

Devil's Dyke, (1) an earthwork in Cambridgeshire, England, of prehistoric construction, about 20 feet in height. It is supposed to have been erected as a defense against enemies advancing from the Fen country. It extended from the fens, or marshes, to the wooded hills, and thus closed the only way of approach from the interior towns of England, and prevented raids upon whatever band of conquerors held the country near the sea. (2) A natural formation near Brighton, England. The old legend said this was the work of the "good spirits" who thus prevented the devil's attempt to flood the country because the people had abandoned paganism.

Devil's-finger, a name sometimes applied to the starfish (q.v.).

Devil's Island (*ISLE DU DIABLE*), a small rock formation off the coast of French Guiana, belonging to France. The area is about 16 square miles, and the island itself is sandy, dry, and torrid. Here Alfred Dreyfus was imprisoned for alleged treason.

Devil's Parliament, a nickname for an English parliament which met in 1459 at Cov-

entry. The parliament was under the control of Henry VI., and at his instigation proscribed and attainted for treason the Duke of York and his adherents.

Devil's Punch-bowl, a lake of Ireland, near the summit of Mangerton Mountain, in the vicinity of the Lakes of Killarney. It is between 2,000 and 3,000 feet above the level of the sea, and is supposed to be the crater of an ancient volcano. It is about half a mile in length and fully one third in breadth.

Devil's Slide, a gorge of the Utah Mountains, formed wholly by the natural arrangement of parallel crags and resembling an inclined plane. The accidental juxtaposition of two such boulder masses, accounted for by the simultaneous action of a cooling atmosphere on liquefied masses, is a feature of Utah scenery.

Devil's Wall, an ancient fortification in the southern part of Germany, about 368 miles long. This wall was originally a Roman ditch, with palisades behind it. It was intended to protect the Roman settlements on the left bank of the Danube, and on the right bank of the Rhine, against the inroads of the Teutonic and other tribes. Remains of it are found at present only from Abensberg, in Bavaria, to Cologne. As to the time when this rampart was built our information is very scanty. Some parts of the northern Roman fortifications may be as old as the time of Drusus. The Decumat or Tithe Lands, however; that is, the lands to the east of the Rhine and north of the Danube, which the Roman emperors allowed immigrants to settle on, on condition of paying tithes to the state, do not appear to have had any protecting wall about 14 B.C. The main rampart, stretching southward from the Main to the Danube, was probably completed under Hadrian, and parts of it which had been destroyed seem to have been restored by Probus. All the parts of this great rampart are still far from being thoroughly investigated.

De Vinne, Theodore Low, American printer: b. Stamford, Conn., 25 Dec. 1828. He learned the printer's trade and became an employee and later partner of Francis Hart, upon whose death he founded the firm of Theodore L. De Vinne and Company in New York. He has written several works on typography, including 'Invention of Printing,' and 'Historic Types.'

Devise, *de-vîz'*, a gift of real property by a person's last will and testament. The term devise technically and properly only applies to real estate; the object of the devise must therefore be that kind of property. The word, however, is sometimes improperly applied to a bequest or legacy. In regard to a lapsed devise, where the devisee dies during the life of the testator, although there may be a residuary devisee, the estate will go to the heir. But if the devise be void, as where the devisee is dead at the date of the will, or is made upon a condition precedent, which never happens, the estate will go to the residuary devisee, if the language is sufficiently comprehensive (4 Kent Com., 541, 542, and cases cited in notes). But some of the cases hold in that case, even, the estate goes to the heir (4 Ired. Eq., N. C., 320; 6 Conn., 292). In England a residuary bequest operates upon all the personal estate which the testator is possessed of at the time of his death, and will include such as would have gone to pay specific legacies which lapse or are void. A general de-

DEVIZES — DEVONIAN SYSTEM

vise of lands will pass a reversion in fee, even though the testator had other lands which will satisfy the words of the devise, and although it be very improbable that he had such reversion in mind. A general devise will pass leases for years, if the testator have no other real estate upon which the will may operate; but if he have both lands in fee and lands for years, a devise of all his lands and tenements will commonly pass only the lands in fee simple. But if a contrary intention appear from the will, it will prevail. A devise in a will can never be regarded as the execution of a power, unless that intention is clear, as where otherwise the will would have nothing on which it could operate. But to have that operation the devise need not necessarily refer to the power in express terms. But where there is an interest on which it can operate, it shall be referred to that, unless some other intention is obvious. The devise of all one's lands will not generally carry the interest of a mortgagee in premises, unless that intent is apparent. Devises are contingent or vested—that is, after the death of the testator; contingent when the vesting of any estate in the devisee is made to depend upon some future event, in which case if the event never occur, or until it does occur, no estate vests under the devise. But when the future event is referred to merely to determine the time at which the devisee shall come into the use of the estate, this does not hinder the vesting of the estate at the death of the testator.

Devizes, de-vi'zēz, England, a municipal borough in the county of Wilts, 82 miles southwest of London. The chief manufactures are steam-engines, boilers, gas-engines, and beer. Pop. 6,914.

Dev'on, a river of Scotland, which has its source at the foot of the Ochill Hills, and flows into the Forth about two miles above Alloa. Its length is 34 miles. Below the Crook of Devon are a series of cascades, the most noted of which are the Caldron Linn and those at the Rumbling Bridge.

Devo'nian Period. In Devonian time, that part of Paleozoic time, following Silurian and preceding Carboniferous, North America was represented by a northern continental land mass and by an Appalachian land mass on the east, this Appalachian land having its western boundary where are the Blue Ridge Mountains, and extending as far south as Georgia; its eastern boundary, probably now covered by the Atlantic Ocean, may have been many miles from the present shore line. A continental land mass extended from the Hudson River westward, its shore line forming a great bay that covered central New York and part of Ontario, Ohio, and Michigan, and extending westward across Illinois, possibly connected with an uplift that reached from Wisconsin to South America. West of Wisconsin the Devonian land may have reached Montana. From northern Minnesota the continental shore line extended northwest to the Arctic Ocean in the neighborhood of the mouth of the Mackenzie River. The Gulf of St. Lawrence was much larger than now, and several long, narrow channels or sounds extended from it southwestward across New England and New Brunswick. There were islands along the line of the Cincinnati anticline in Ohio, Kentucky and Tennessee. There was a land area in

eastern Colorado, another covering the area of the Black Hills in South Dakota, another in central Texas and there was a long narrow strip of land along the west side of what is now the great basin in Nevada and Utah.

In middle Devonian time Europe was largely covered by an open sea containing numerous islands, and most of Russia and Siberia and part of Central Asia were under water. In Scotland and Wales were landlocked seas or lakes, and there were others in western Russia. A large part of central South America was covered by water. Fossil evidence indicates that in early Devonian there were land connections between North and South America, and between South America and South Africa. The vegetable and animal life of Devonian time, so far as can be determined, did not differ greatly from Silurian forms, though it shows a general advance toward more highly developed types. The land vegetation included cryptogams and Gymnosperms. Of the cryptogams the tree-ferns and the giant club-mosses (*Lepidodendra*) must have been conspicuous in the forests, being over 50 feet high. Of the gymnosperms, cycads, now almost extinct, were abundant, and it is possible that conifers of the yew family grew upon the higher ground.

Of animal life the trilobites, so abundant in Cambrian and Silurian time, were less important, but other crustaceans developed greatly, including the eurypterids, related to the horseshoe crabs, and decapods, or lobsters. Corals were very abundant in the Devonian oceans. Crinoids, or sea-lilies, and starfish were more abundant than in Silurian time. The brachiopods, or lamp-shells, apparently were, as in Silurian, the most abundant elements of marine life. Of mollusks, there were bivalves and gastropods; the ammonites appeared among the cephalopods, and nautilus-like forms were less abundant than in the Silurian. The chief characteristic of Devonian time, however, was the great development of the fishes, the Devonian being known as the "age of fishes." Many of the Devonian forms, however, have long been extinct, while the teleosts, which include by far the greater part of modern fishes, evidently did not exist at all in Devonian time. Among the odd Devonian forms were the ostracodermata, fish-like animals allied to the lampreys, but having the head and sometimes a large part of the body covered with bony plates. Of the true fishes the selachians, or sharks, were represented, as were the dipnoi or lung fishes, now almost extinct. The most highly developed Devonian fishes were the ganoids, now represented by the sturgeon and the gar-pike. See DEVONIAN SYSTEM; PALEOZOIC ERA.

Devonian System. The name Devonian appeared in geological literature in 1839, when Murchison and Sedgwick applied it to a rock system in Devonshire and Cornwall, England, consisting of conglomerates, shales and fossiliferous limestones lying below the carboniferous rocks and above the great mass of the graywacke or transitional series of Werner that was already included in the Cambrian or Silurian. Murchison and Sedgwick also included in the Devonian the old red sandstone of Scotland. In the United States, Hall of the New York Geological Survey, in an admirable report published in 1843, divided the Cambrian, Silurian,

DEVONIAN FOSSILS.

1. A Brachiopod (*Athyris concentrica*); interior of dorsal valve, showing spiralia.
2. An Ammonite (*Goniatites intumescens*); a lateral view.
3. Hulls of fossil Entomostracans (*Cyprididae*) in a slab of schist.
4. Shells of the same (*Cypridina serratostrata*).
5. An Armored Fish (*Pterichthys cornuta*).
6. A Trilobite (*Phacops latifrons*), shown in a and b rolled up.

7. A Gasteropod Mollusc (*Murchisonia bigranulosa*).
8. A Great Armored Fish (*Cephalaspis lyelli*); restored.
9. The Berry-bone Fish (*Coccoosteus decipiens*); restored.
10. A Gasteropod Mollusc (*Macrocheilus subcostatus*).

DEVONPORT — DEVRIENT

and Devonian systems of the Appalachian formations, and his work has needed little revision. The rocks of the Devonian System in North America are now subdivided into the Lower or Oriskany and Corniferous series, the Middle or Hamilton, and the Upper or Chemung. The Corniferous is subdivided into the Schoharie and Corniferous stages, the Hamilton into the Marcellus and Hamilton stages, and the Chemung into the Portage and Chemung stages. Where the line between the Silurian and Devonian systems should be drawn in North America is still a matter of dispute, the lower Helderberg formation of the Silurian being assigned to the Devonian by some European geologists. Of the stages named above, the Oriskany is a calcareous sandstone, covering eastern New York and extending south into Virginia, while on the west it extends into Ontario. It also outcrops in Illinois and in northern Alabama. It forms thick strata in Maine, and occurs in eastern Quebec. The Schoharie stage includes grits and fine conglomerates and having about the same distribution as the Oriskany. The Corniferous is a great limestone formation, largely made of corals, found in New York, Pennsylvania, Virginia, Ohio, Indiana, Illinois, Missouri and Iowa, also in Vermont and Quebec. The Hamilton series, which has about the same distribution as the Corniferous, is represented by a great thickness of shales and shaly sandstones in New York and Ohio. It thins out southward and westward, and in Indiana, Illinois, Missouri and Iowa is represented by limestones. It is represented by sandstones and shales in eastern Quebec, and in New Brunswick and Nova Scotia. The Chemung series includes a thick shale and sandstone formation in New York, Ohio and Pennsylvania, but thins away rapidly to the westward. The flags, grits, shales, and sandstone of the Catskill group in New York are included for the most part in the Chemung. In Manitoba and the Northwest Territory, Canada, the Devonian System includes limestones and shales, and is of moderate thickness. There is an area of Devonian rocks extending along the Rocky Mountains from Montana across Alberta. In the United States the Devonian rocks of the Rocky Mountains appear in Colorado and Arizona. There are also ores in the Wasatch Mountains in Utah, in Nevada and in California.

In England and on the continent the Devonian System presents two different classes of rocks, (1) the Old Red Sandstone, occurring in Scotland, in South Wales and across the Welsh border in England, also in the Baltic provinces of Russia, and in Spitzbergen; and (2) the Marine Devonian, occurring in southwest England, in northern and southern France, in Spain, and over large areas in Germany and central Russia. The Old Red Sandstone was laid down in shallow seas either closed or having only slight connection with the open ocean. The formation is of interest from its containing remains of Devonian land animals and plants. The rocks are fine-grained conglomerates, sandstones, and shales. The Marine Devonian of Europe is largely limestone with some shales and slates.

Devonian rocks in Asia are found over a vast area in Siberia and also occur in China and in Asia Minor. In Africa they are found both in the northern and southern parts of the continent. In South America Devonian rocks form

a great system, being found in Brazil, Bolivia, and the Falkland Islands. See CATSKILL GROUP; CHEMUNG STAGE; CORNIFEROUS STAGE; HAMILTON STAGE; MARCELLUS STAGE; PORTAGE STAGE; OLD RED SANDSTONE; ORISKANY STAGE.

See Zittel, 'History of Geology and Palæontology'; Dana, 'Manual of Geology'; Geikie, 'Text-book of Geology'; Leconte, 'Elements of Geology.'

Dev'onport (before 1824 called **Plymouth Dock**), England, a parliamentary and municipal borough, maritime town, and naval arsenal, in the southwest of Devonshire. It owes its existence to the dockyard established here by William III. in 1689, and is one of the chief naval arsenals in Great Britain.

Dev'ons, the name given to a breed of cattle which were first bred in Devonshire, England. They are rather wild, of a dark-red color, and can be used instead of horses for plowing. They are smaller than Shorthorns or Herefords. The bull has a small head, fine muzzle and face, very handsome horns, which should taper upward and rather backward; the eye is large and rather wild, indicating an active disposition; the neck is arched, but the dewlap is not much developed; tail set on rather high; good barrel well up behind the shoulder; not the depth of carcass in the same height as is found in the Shorthorns; skin of a dark-red and rather mottled character, and plenty of long curling hair; the skin is thicker than that of Shorthorns, but not so thick as that of Herefords. They form a good deal of inside fat and firm meat. The cows yield a very rich milk. They are hardy, and able to find food on poor uplands.

Dev'onshire, **Spencer Compton Cavendish**, 8TH DUKE OF, English statesman: b. 23 July 1833. He succeeded to the ducal title in 1891, having previously become well known by his courtesy title of the Marquis of Hartington. First returned to the House of Commons in 1857, he was appointed a lord of the admiralty in 1863, and secretary of state for war in 1866. He was postmaster-general under Gladstone 1868-71, and chief secretary for Ireland 1871-4. He was secretary for India 1880-82, and became secretary of state for war 1882-5. Since 1886 he has been recognized as an active and influential leader of the Liberal Unionists, and on the formation of a Unionist ministry in 1895 accepted the post as lord president of the council.

Devonshire, the third largest county in England, situated in the southwest. It is famous for its Old Red Sandstone (see DEVONIAN SYSTEM). This county contains the barren tract of Dartmoor and also the valley of the Exe, called "The Garden of Devonshire." For history, see ENGLAND.

Devrient, dĕv-rĕ-ăn, a family of German actors, of whom the most talented was LUDWIG DEVRIENT (1784-1832), distinguished both in comedy and in tragedy, and especially noteworthy as an exponent of Shakespearian characters. His nephew, CARL AUGUST (1797-1872), the eldest of the brothers Devrient, played lovers' parts and was the husband of the *diva*, Madame Schröder-Devrient (1805-60). PHILIPP EDUARD (1801-77), the second brother, was a delightful baritone singer in the early part of

the 19th century, and afterward became a painstaking, though not a great actor. He was the author of a number of plays, and of the valuable 'Geschichte der deutschen Schauspielkunst' (1848-74); and with his son Otto (1838-94) prepared an edition of Shakespeare. GUSTAV EMIL (1803-72), the youngest and most gifted of the three brothers, was most successful in tragic and emotional parts, and became identified in Germany with such characters as Hamlet, Tasso, and especially Posa.

De Vries, de vrēs, David Peterzen, Dutch colonist in America. Nothing definite is known as to the dates of his birth and death. He was a member of a company organized in 1630 to settle the tract of land in the present State of Delaware, which had been bought in 1629 from the Dutch West India Company by Samuel Blommaert and Samuel Godyn. On his arrival 1632 he found that the colony founded 1631 on Lewes Creek, Cape Henlopen, and called with the surrounding country "Swaanendael," had been completely destroyed by the Indians. He left some of his party there and visited Virginia, but took the colonists back to Holland in 1634. Later he visited Manhattan several times and tried to found a colony on Staten Island, which the Indians destroyed in 1640. He also lived on a plantation called Vriessendael, on the site of Tappan, N. Y. Among his works is: 'Korte historiael ende Journaels Aenteyckeninge van verscheyden Voyagien in der Vier Teelen des Wereldts Ronde'; 'A short history and notes of a journal kept during several voyages in the four parts of the world' (1655).

Dew, Thomas Roderic, American publicist: b. King and Queen County, Va., 5 Dec. 1802; d. Paris, France, 6 Aug. 1846. He was graduated from William and Mary College, and in 1827 was elected professor of political economy, history, and metaphysics in William and Mary College, and in 1836 was made president of that institution. In 1829 he published his 'Lectures on the Restrictive System.' It was brought out at a moment when feeling ran high on the subject of the tariff, between protectionists and free-traders; and though emanating from the closet of a thinker removed from the agitations of political warfare, took a strong hold on the public mind, and the subsequent adoption of the compromise of 1832 may be attributed in part to its silent influence. His most elaborate work was 'A Digest of the Laws, Customs, Manners, and Institutions of the Ancient and Modern Nations' (1853).

Dew, a deposition of water from the atmosphere upon the surface of the earth. During the day the earth both absorbs and emits heat, but after sunset its supply of warmth is cut off, while it still continues to radiate heat into the surrounding space. Grass, flowers, and foliage being good radiators, lose after sunset the heat which has previously been absorbed by them, without receiving any in return, and their temperature consequently falls considerably below that of the atmosphere. From the proximity of these cold substances the particles of vapor in the adjoining air are condensed and deposited upon their surfaces in the form of dew, or of hoarfrost where the temperature of the earth is below 32°. When the sky is clouded the heat abstracted from the earth's surface by radiation is restored by the clouds,

which, being good radiators, transmit an equal amount of heat to what they receive; and a balance of temperature being thus maintained between the earth and the surrounding atmosphere, no dew is formed. The deposition of dew is likewise prevented by wind, which carries away the particles of air before the vapor contained in them has been condensed by the heat imparted by the adjoining radiating substances. Horizontal surfaces, and those which are exposed to a wide expanse of sky, receive a greater supply of dew than sheltered or oblique surfaces, where circumstances diminish the amount of radiation.

An acquaintance with the cause which produces dew and hoarfrost enables us to understand the rationale of the process resorted to by gardeners to protect tender plants from cold, which consists simply in spreading over them a thin mat or some flimsy substance. In this way the radiation of their heat to the heavens is prevented, or rather the heat which they emit is returned to them from the awning above, and they are preserved at a temperature considerably higher than that of the surrounding atmosphere. To insure the full advantage of this kind of protection from the chill of the air, the coverings should not touch the bodies they are intended to defend.

The radiation from the earth's surface is one of those happy provisions for the necessities of living beings with which nature everywhere abounds. The heavy dews which fall in tropical regions are in the highest degree beneficial to vegetation, which, but for this supply of moisture, would, in countries where scarcely any rain falls for months, be soon scorched and withered. But after the high temperature of the day the ground radiates under these clear skies with great rapidity, the surface is quickly cooled, and the watery vapor, which, from the great daily evaporation, exists in large quantities in the atmosphere, is deposited abundantly. This deposition is more plentiful also on plants, from their greater radiating power; while on hard, bare ground and stones, where it is less wanted, it is comparatively trifling. In cold climates the earth, being cold and sufficiently moist, requires little dew; accordingly the clouds, which are so common in damp and chilly regions, prevent the radiation of heat: the surface is thus preserved warm, and the deposition of dew is, in a great measure, prevented.

Dewas, dā-wās', India, (1) a native state in the Nimar and Malwa agency, consisting of two combined states with two chiefs; area 883 square miles. Grain, opium, sugarcane, and cotton are its chief productions. Pop. 152,073. (2) Dewas, the chief town, contains the residences of both chiefs, and near it, on a conical hill, is a temple. Pop. 15,100.

Dewberry, *Rubus villosus*, or *Rubus canadensis*, a trailing plant of the natural order *Rosaceæ*. Its prickly stems, leaves, and fruit resemble the blackberry. During the last quarter of the 19th century it became popular as a cultivated fruit, principally through the introduction of its variety, the *Lucretia*, which is superior to the wild forms common as weeds on wornout pastures and poor land. The plants, which are propagated by means of stem-tips, do best on a rather lighter soil than the black-

berry, like which, with the exception of training, it is cultivated and fertilized. They are usually trained to stakes or trellises, and not given summer pruning, except in the removal of canes as soon as they have fruited. The usual distances for planting are three or four feet by six. The fruits ripen considerably in advance of the blackberries. See BLACKBERRY; RASPBERRY; RUBUS.

Dewdney, Edgar, Canadian statesman: b. Devonshire, England, 1835. He studied civil engineering, and on removing to Canada was employed to lay out the town of New Westminster. Though working at his profession for a number of years, he took an active interest in politics, was elected to the legislature of British Columbia in 1869, and in 1872 was elected to the Canadian Parliament, where he was one of the chief supporters of Sir John Macdonald of the Opposition. In 1871 he was appointed Indian Commissioner for the Northwest Territory, and in 1881 lieutenant-governor of the Territory, holding the two offices until 1888, when he became minister of the interior in the Canadian cabinet. In 1892 he was appointed lieutenant-governor of British Columbia.

Deweese', William Potts, American physician: b. Pottsgrove, Pa., 5 May 1768; d. Philadelphia 18 May 1841. He attended several courses of medical lectures at the University of Pennsylvania, and in 1793 began practice in Philadelphia. Here he achieved for himself a high reputation, especially in that department to which he devoted particular attention, midwifery, previously much neglected in America. He published 'Inaugural Essays'; 'System of Midwifery,' of which latter many editions have been printed'; 'A Treatise on the Physical and Medical Treatment of Children'; 'A Treatise on Diseases of Females'; 'Practice of Medicine' (1830). In 1826 he was elected adjunct professor, and in 1834 professor of obstetrics and diseases of women and children in the University of Pennsylvania.

De Wet, dā-vět', Christian, Boer general: b. Dewetsdorp, Orange Free State (now Orange River State), about 1860. He was bred a farmer, made a small fortune, and became a member of the Volksraad. Though practically without military experience, he served ably in the Boer-British War of 1899-1900, attaining the rank of general and outwitting the pursuit of Kitchener and Roberts in the summer of 1900, and of the former in the early part of 1901. His stand at Sanna's Post was highly praised by military experts. He was especially noted for his humane treatment of prisoners of war. His 'Three Years of War' was published in 1902.

De Wette, dě vět'tě, Wilhelm Martin Leberecht, German theologian: b. Ulla, near Weimar, January 1780; d. Basel, Switzerland, 16 June 1849. In 1807 he became professor of theology at Heidelberg, and in 1810 he was called to be the colleague of Schleiermacher at Berlin. In 1822 he accepted the chair of theology at Basel, where he remained till his death. The influence of De Wette's views upon the theological tendencies of his time was most important. He was remarkable for his critical acuteness, and for his powers of concise and clear exposition. His works are very numerous. Among

them are: 'Beiträge zur Einleitung in das Alte Testament' (1806-7); 'Lehrbuch der historisch-kritischen Einleitung in die kanonischen und apokryphischen Bücher des Alten Testaments' (1817); 'Einleitung in das Neue Testament' (1826); 'Lehrbuch der hebräisch-jüdischen Archäologie' (1814); 'Kurzgefasstes exegetisches Handbuch zum Neuen Testament' (1836-48). These works are all more or less of a critical nature; in the following he developed his own theological views: 'Lehrbuch der christlichen Dogmatik' (1813-16); 'Christliche Sittenlehre' (1819); and the didactic novel, 'Theodor oder des Zweiflers Weihe' ('Theodore, or the Consecration of the Sceptic,' 1822).

Dewey, Chester, American educator: b. Sheffield, Mass., 25 Oct. 1784; d. Rochester, N. Y., 15 Dec. 1867. He was graduated at Williams College in 1806, where, in 1810, he became professor of mathematics and natural philosophy, a post he held 17 years. In 1836 he was appointed principal of the Collegiate Institute in Rochester, N. Y., and in 1850 became professor of chemistry and natural philosophy in the University of Rochester, resigning 10 years later. He was an authority on grasses. He wrote 'History of the Herbaceous Plants of Massachusetts,' and valuable papers on botany.

Dewey, Davis Richard, American political economist and statistician: b. Burlington, Vt., 7 April 1858. He is a brother of John Dewey (q.v.). He was educated at the University of Vermont, and at Johns Hopkins University. He is professor of economics and statistics in the Massachusetts Institute of Technology, and secretary of the American Statistical Association. His works are: 'Syllabus of Political History Since 1815'; 'Report of Massachusetts Board to Investigate the Subject of the Unemployed' (1895); 'Report of Commission to Investigate the Public Charitable and Reformatory Interests and Institutions of the Commonwealth' (1897); 'Financial History of the United States' (1902).

Dewey, George, American naval officer: b. Montpelier, Vt., 26 Dec. 1837. At 17, after a preparatory course in the Northfield Military School, young Dewey was appointed a cadet at Annapolis, in the class which was graduated in 1858. At the outbreak of the Civil War he was commissioned a lieutenant under Admiral Farragut and assigned to the sloop-of-war Mississippi. His first active experience in war was when the West Gulf squadron, early in 1862, forced a passage up the Mississippi River ahead of Farragut. A later enterprise resulted in the grounding of the Mississippi, in the middle of the night, while attempting to run the batteries of Port Hudson. Here she was riddled with shot and set afire by the enemy's batteries, so that officers and crew had to abandon her, and make their way as best they could to the other shore before the flames reached her magazine and she exploded.

Other notable engagements in which Dewey figured during the Civil War were at Donaldsonville in 1863, and at Fort Fisher in the winter of 1864-5, as an officer of the Agawam. Receiving his commission as lieutenant-commander in March 1865, he served for two years on the Kearsarge and the Colorado, and was then attached to the Naval Academy for two years more. In 1870 he was given command of the Narragansett, and during his five years' charge

of her rose to be a commander. He was then attached to the Lighthouse Board, and in 1882 took his next sea duty in command of the *Juniata* of the Asiatic squadron. On reaching his captaincy, in 1884, he took charge of the *Dolphin*, one of the first vessels of the new navy. From 1885 to 1888 he commanded the *Pensacola*, then flagship of the European squadron; and this service was followed by shore duty, in the course of which he served as chief of the Bureau of Equipment at the Navy Department, and afterward on the Lighthouse Board for a second time. In 1896 he was promoted to commodore, and made president of the Board of Inspection and Survey. At the beginning of 1898, a few weeks before the outbreak of the Spanish-American war, he was placed in command of the Asiatic squadron, and was thus given the chance to distinguish himself which he so brilliantly improved.

With his squadron he left Miao Bay, China, 27 April 1898, with orders to "capture or destroy the Spanish squadron," then supposed to be in Manila Bay, under command of Admiral Montejó. The squadron entered the channel of Manila at 11:30 P.M., Saturday, 30 April, and early on Sunday morning, 1 May, sank, burned or captured all the ships of the Spanish squadron in the bay, silenced and destroyed three land batteries, obtained complete control of the bay, so that he could take the city, the chief port of the Philippine Islands, at any time, and all without losing a single man, and having only nine slightly wounded. On 18 August Dewey and his ships aided Gen. Merritt in the capture of Manila. In recognition of his Manila Bay achievement, Commodore Dewey received the thanks of Congress, which awarded to him a magnificent sword, and medals to his men. As a further recognition of his achievement, Commodore Dewey was (7 May 1898) promoted to be a rear-admiral, and subsequently (3 March 1899) made admiral of the navy under an act of Congress, approved 2 March 1899, restoring that rank for the especial purpose of enabling the country to honor adequately the hero of Manila Bay. In 1901 he was president of the Schley court of inquiry, and in 1902 was appointed commander-in-chief of the united squadrons and fleets mobilized for extraordinary manoeuvres. Consult Clemen's 'Life of Dewey' (1899).

Dewey, John, American psychologist: b. Burlington, Vt., 20 Oct. 1859. He was educated at the University of Vermont and has been professor of philosophy at the University of Chicago from 1884, and editor of the 'Elementary School Record.' Among his works are: 'Psychology'; 'Leibnitz's New Essays Concerning Human Understanding'; 'Critical Theory of Ethics' (1891); 'Study of Ethics.'

Dewey, Melvil, American educator and librarian: b. Adams Centre, N. Y., 10 Dec. 1851. He was graduated from Amherst College in 1874; was college librarian during his senior year and for two years after graduation. He then went to Boston where he was active in founding the American Library Association, the Library Bureaus, the Metric Bureau for introducing the metric system, and the Spelling Reform Association. He was the founder and for five years the editor of the 'Library Journal' and also editor of 'Library Notes' and the

'Spelling Reform Bulletin.' In 1883 he was appointed librarian at Columbia, and in 1887 established the school of library economy, of which he was made director. In 1889 he became secretary of the University of the State of New York, and director of the State library, the library school being at that time transferred to Albany; in 1891 he became director of the home education department, and organized the system of traveling libraries. In New York State he has accomplished much in the raising of school standards, and particularly in the improvement and founding of small public libraries. He has also had much influence on library work in the United States; has twice been president of the American Library Association, and its secretary for 15 years; he devised the decimal system for the classification of books which is widely used, and published a set of cataloguing rules, included in his 'Library School Rules.' He has also published a revision of the laws of New York State in regard to education (1892), and the 'Decimal Classification and Relative Index' (1885).

Dewey, Orville, D.D., American Unitarian clergyman: b. Sheffield, Mass., 28 March 1794; d. there 21 March 1882. He was graduated at Williams College in 1814, and pursued his divinity studies at Andover Theological Seminary 1816-19; but became a Unitarian and soon after an assistant of Dr. Channing. He was pastor of the Unitarian Church in New Bedford 1823-33, and of the 2nd Unitarian Church in New York 1835-48. He published: 'The Old World and the New' (1836); 'Letters on Revivals'; 'Discourses on Human Nature'; 'Discourses on Human Life'; 'Discourses on the Nature of Religion'; 'Discourses on Commerce and Business'; 'Miscellaneous and Occasional Discourses'; 'The Unitarian Belief'; 'Discourses and Reviews.'

De Windt, de wint, Harry, English explorer: b. Paris, France, April 1856. He was educated at Cambridge, and after serving as aide-de-camp to his brother-in-law, Rajah Brooke of Sarawak, 1876-8; went from Peking to Paris by land 1887; visited mines and prisons in Siberia 1890-4; explored the Klondike 1897, and went from Paris to New York by land for the London *Daily Express* 1901-2. He has written: 'On the Equator' (1882); 'From Peking to Calais by Land' (1887); 'A Ride to India' (1890); 'Ennui de Voyage,' poems (1890); 'Siberia as it Is' (1892); 'The New Siberia' (1895); 'A Queer Honeymoon,' a novel; 'Through the Gold Fields of Alaska to Bering Strait' (1898); 'True Tales of Travel and Adventure' (1899); 'Finland as it Is' (1901).

Dewing, Thomas Wilmer, American figure and portrait painter: b. Boston 4 May 1851. He was a pupil of Boulanger and Lefèvre and is an academician of the National Academy of Design 1888, and a member of the Society of American Artists. Among his pictures are: 'Prelude'; 'The Days,' which took the Clarke prize in 1887, and 'The Garden.'

De Wint, Peter, English landscape painter in water-colors: b. Stone, in Staffordshire 21 Jan. 1784; d. London 30 June 1849. He studied in the schools of the Royal Academy, where he occasionally exhibited; but most of his pictures were shown in the exhibitions of the Water-color Society. English scenery was his

Copyright, 1903, by Clinedinst.

ADMIRAL GEORGE DEWEY.

favorite subject. He occasionally painted in oil with marked success. Some of his best pictures are: 'A Corn-field'; 'Woody Landscape with Water'; 'Lincoln Cathedral'; and 'Harvest-time.'

De Witt, Jan, yān dē wīt, Dutch statesman: b. Dort 1625 or 1632; d. The Hague 20 Aug. 1672. He became the leader of the political party opposed to the Prince of Orange, and in 1652, two years after the death of William II., was made grand pensionary. In 1665 the war with England was renewed and conducted by De Witt with great ability till its termination in 1665. In 1672 Louis XIV. invaded the Spanish Netherlands and involved Holland in war. De Witt's popularity, already on the decline, suffered still further in the troubles thus occasioned, and he felt it necessary to resign his office of grand pensionary. At this time his brother Cornelius, who had been tried and put to torture for conspiring against the life of the young Prince of Orange, lay in prison. Jan de Witt went to visit him, when a tumult suddenly arose among the people, and both brothers were murdered. De Witt was a man of high character, simple and modest in all his relations.

Dewitt, John, American Dutch Reformed clergyman: b. Albany, N. Y., 29 Nov. 1821. He was graduated at Rutgers College in 1838, and at New Brunswick, N. J., Theological Seminary in 1842. He was pastor of several churches 1842-63, and professor of Oriental literature and of Hellenistic Greek at the New Brunswick Theological Seminary 1884-91. He has been a member of the American Testament Revision Committee since 1872. Among his works are: 'The Sure Foundation'; 'Praise Songs of Israel'; 'The Psalms,' a new translation; and 'What is Inspiration?'

Dewitt, John, American Presbyterian theologian: b. Harrisburg, Pa., 10 Oct. 1842. He graduated at Princeton 1861; took up the study of theology at Princeton Theological Seminary and at Union Theological Seminary, New York, and was ordained to the ministry in 1865. He has been pastor of several churches, professor of ecclesiastical history Lane Seminary, Cincinnati, 1882-8, and professor in McCormick Theological Seminary, Chicago, 1888-92. He has published 'Sermons on the Christian Life.'

De Worms, Henry, 1ST BARON PIRBRIGHT, English statesman and writer: b. 1840; d. London 10 Jan. 1903. He was educated at King's College, London, was admitted a barrister of the Inner Temple in 1863, and sat in the House of Commons for Greenwich 1880-5, and for Toxteth 1885-95. He was under-secretary of the colonies 1888-92. He published 'England's Policy in the East'; 'The Earth and its Mechanism'; 'The Austro-Hungarian Empire'; 'Memoirs of Count Beust.'

Dewsbury, England, a municipal and parliamentary borough in the West Riding of Yorkshire; 30 miles southwest of the town of York; on the Calder. Coal is mined, but the trade of the town is chiefly in heavy woolen cloths, including blankets, carpets, flannels, and worsteds. It has manufactories for fancy cloths and shoddy goods, contains iron and boiler works. Pop. of municipal borough 29,637; of parliamentary borough 74,349.

Dexter, Henry, American merchant: b. West Cambridge (now Arlington), Mass., 14 Vol. 6—17

March 1813. He early established a connection with publishing firms in Boston and Cambridge, which was continued until 1836. He then went into the hardware business, remaining in this until 1842, when he took up the wholesale trade in books, periodicals and newspapers. He organized the American News Company in 1864, serving as president.

Dexter, Henry Martyn, American Congregational clergyman: b. Plympton, Mass., 13 Nov. 1821; d. New Bedford, Mass., 13 Nov. 1890. He was graduated at Yale 1840, and at Andover Theological Seminary 1844. He filled a pulpit in Manchester, N. H., 1844-9, and was pastor of Berkeley Street Church, Boston, 1849-67. He was one of the editors of the 'Congregational Quarterly' from 1859 to 1865, becoming editor-in-chief of the 'Congregationalist' 1867. He was a staunch defender of the Congregational polity and delighted in controversy. His principal works are: 'The Voice of the Bible and the Verdict of Reason' (1858); 'Congregationalism: What it Is, Whence it Is, How it Works. Why it is Better than Any Other Form of Church Government, and its Consequent Demands' (1865); 'Roger Williams and His Banishment From the Massachusetts Colony' (1876); 'The Congregationalism of the Last Three Hundred Years' (1881); 'Common Sense as to Woman Suffrage' (1885); 'Early English Exiles in Amsterdam' (1890).

Dexter, Samuel, American statesman and jurist: b. Boston 14 May 1761; d. Athens, N. Y., 4 May 1816. He was graduated at Harvard University 1781; was admitted to the bar in 1784. He was repeatedly chosen to the legislature of Massachusetts, and in 1798 was elected senator of the United States. While senator he was appointed secretary of war in 1800, and in the same year secretary of the treasury. He was afterward, at different times, offered foreign missions, but always refused them. About the year 1802 he withdrew from political life, and returned to his profession. He was an unsuccessful candidate for governor in 1814. He was the first president of the first society formed in Massachusetts for the promotion of temperance.

Dexter, Timothy, American merchant: b. Malden, Mass., 22 Jan. 1743; d. Newburyport 22 Oct. 1806. He succeeded in amassing a large fortune for those days. He developed certain eccentricities which gave him great notoriety, assuming the title of Lord Timothy Dexter. For example, he constructed odd and bizarre residences in Newburyport, Mass., and Chester, N. H. The grounds of the first house were adorned with thirty or forty colossal wooden statues of famous men. He included himself in the number. He also made an extraordinary collection of absolutely worthless paintings, in order to prove his knowledge of art, and supported a poet who was supposed to be ready to sing his praises upon occasions. He wrote a book called 'A Pickle for the Knowing Ones' and also a pamphlet with all the punctuation marks printed upon the last page, there being none in the text proper.

Dextrin (C₆H₁₀O₅), a body obtained from starch, and very similar to it in composition; also called starch gum, British gum, etc. It resembles gum in being soluble in water, but is distinguished from that substance by composition, by being, like starch, converted into oxalic

DEXTROSE — DIABASE

acid by nitric acid, and not into mucic acid, and especially by causing a ray of polarized light to deviate to the right, a property from which it derives its name. It is prepared from starch by several processes. The transformation may be effected by dilute sulphuric acid at a temperature a little below that of boiling water. By acting upon starch with diastase (q.v.) dextrin is produced. To water at about 70° or 80° F., in a boiler, 8 or 10 parts of dried malt are added, and then 100 parts of starch after the heat is raised to 140° F. The mixture is kept stirred and the temperature maintained somewhat above this for 20 minutes, and then, when the thick mass has become quite fluid, it is raised to the boiling-point rapidly, cooled, the clear liquor filtered, and evaporated to a syrup. When cold it is an opaque gelatinous mass, which, on drying, becomes hard like gum. Dextrin is used in large quantities for thickening calico-printers' colors, for making adhesive paper and labels, and for postage stamps, as a varnish, and for many other purposes.

Dextrose, dēks'trōs, grape-sugar, starch-sugar, or dextroglucose, $C_6H_{12}O_6$ or $C_6H_7O(OH)_5$. Dextrose occurs along with levulose in grapes and other sweet fruits, also in honey and in the urine of diabetic patients. It can be produced by the action of dilute sulphuric acid on cane-sugar, starch, cellulose, etc. It can be best obtained by boiling for several hours 50 parts of starch with dilute sulphuric acid (100 parts of water to 5 parts of H_2SO_4). The solution is then neutralized with chalk, filtered, boiled with animal charcoal to remove traces of color, and then evaporated carefully to dryness, forming an amorphous mass which contains about 60 per cent of dextrose, the remainder being chiefly dextrin. Pure dextrose can be obtained by crystallization from alcohol; it contains then one molecule of water of crystallization, and forms microscopic rhombic crystals, which soften at 60°, melt at 86°, and lose their water of crystallization at 110°. Heated to 170° it is converted into glucosan ($C_6H_{10}O_5$). Dextrose tastes much less sweet than ordinary canesugar. By the action of sodium amalgam on dextrose it is converted into mannite, $C_6H_{14}O_6$. A solution of dextrose becomes brown when boiled with caustic alkalis.

Dey, dā (from Turk. day, maternal uncle, a title of dignity), a title formerly given in the 17th century to the Turkish commander of the army in Algiers. The office was attained by seniority. When the French captured Algiers in 1830, the title and office were of course abolished. The title of dey as given to the governor of Tunis has long been replaced by that of bey. There still exists a dey of Tripoli.

De Young, Michael Harry, American publisher; b. St. Louis, Mo., 5 Oct. 1848. He received a common school education and in 1865 established with his father the 'Dramatic Chronicle,' subsequently merged into the San Francisco *Chronicle*, of which he has been sole proprietor since 1880. He was commissioner from California to the Paris Exposition of 1889, vice-president of the World's Columbian National Commission in 1892, and director-general of the California Midwinter Exposition of 1893. In the last named year he was made vice-chairman of the Republican National Committee.

Dhalak, dā-lāk', an archipelago of the Red Sea, off the coast of Abyssinia. It contains nearly 100 rocks and islets, mostly uninhabited, clustering round the island of Dhalak-el-Kebir. This island possesses a pearl fishery.

Dhar, dār, India, (1) a small native state in the Malwa agency, in the central part of India, with an area of about 1,740 square miles. The soil is fertile, and yields rice and other cereals. Pop. 169,474. (2) The capital, of the same name, is situated about 180 miles east of Baroda, and contains some striking buildings, and a fort built of red stone stands outside the town. Pop. 18,430.

Dharangaon, dār-ān'gā-ōn, India, city in the Khandesh district, Bombay, having a trade in cotton and oil-seeds, and manufactures of coarse cloth. Pop. 15,072.

Dharwar, dār'wār, India, city, capital of a district of the same name, in the southern Maharashtra country, in Bombay presidency. The city is a trade and dispensing station for the surrounding country. American cotton is raised successfully, and silk and cotton goods are manufactured in the district. Pop. 32,841.

Dhawlagiri, dā-wāl'ā-ghēr'ē, or **Dhaulagiri**, once supposed to be the highest peak of the Himalayas, has a height of 26,826 feet above the sea. It is in Nepal, in lat. 29° N., and lon. 82° 30' E.

Dhole, dōl, a local Indian name for the wild dog, native to parts of India. It is called 'buansu' in the Himalayas. See *Wild Dogs*, under Dogs.

Dholera, dō'lér a, India, city in the Ahmedabad district of Bombay presidency, on a stream entering the Gulf of Cambay, an important cotton mart. Pop. 10,088.

Dholka, dōl'ka, India, city in the Ahmedabad district of Bombay presidency, probably one of the oldest towns in Gujerat. The weaving of women's robes is the principal industry of the town. Pop. 16,494.

Dhow, dow, an Arab sea-going vessel, ranging from 150 to 200 tons burden, with one mast, a yard the length of the vessel, and a large lateen or triangular sail. It is used for merchandise and is often employed in carrying slaves from the east coast of Africa to Arabia.

Dhulia, dōo'lē-ā, India, the chief town of Khandesh district, Bombay presidency, situated on the south bank of the Panjhra River. There is a new and old town combined. It is a cantonment town. Pop. 21,880.

Dhurra, door'ra, or **Dourah**, Indian millet, the seed of *Sorghum vulgare*, after wheat the chief cereal crop of the Mediterranean region, and largely used in those countries by the laboring classes for food. Varieties are grown in many parts of Africa, one of them known as Kaffir-corn.

Di'abase, a word used by petrographers with varied meanings; but the present usage in this country restricts it to crystalline igneous rocks, of the basalt family, generally occurring as dikes, having as essential constituents plagioclase feldspar, augite and magnetite. Olivene may or may not be present. Diabases differ from the

DIABETES INSIPIDUS — DIACAUSTIC CURVE

granitoid rocks, to which they have a somewhat similar texture, in that the crystals of feldspar are long and narrow, or lath-shaped, and the dark silicates are arranged in the interstices of the feldspar crystals, giving an ophitic texture. Diabases are of common occurrence in the United States. They form dikes and laccoliths at various places along the Atlantic seaboard from Nova Scotia to Georgia. The so-called traps of the Connecticut valley and the Palisades of the Hudson, are familiar examples. In the Lake Superior country diabases are of frequent occurrence; notably in the Marquette Iron Range and on Keweenaw Point; the latter sometimes carry native copper. The convenient field name greenstone, is frequently given to old, more or less altered, diabases. By pressure and shearing stresses, and the intrusion of other igneous rocks, diabases change to hornblende and chlorite schists, showing no trace of original structure. Such rocks are common in the Lake Superior region and elsewhere, along the Algonkian and Archæan rocks that characterize the formation of so much of northeastern North America. Diabases are of common occurrence in the Rocky Mountains also, and frequently, over deposits, are found along their contacts with sedimentary rocks, particularly limestones. The typical diabase of the Palisades contains: Si O₂ 53.13; Al₂O₃ 13.74; Fe₂O₃ 1.08; Fe O 9.10; Ca O 9.47; Mg O 8.58; Na₂O 2.30; K₂O 1.03. The specific gravity is 2.96.

Diabetes (dī-ā-bē'tēz) **Insip'idus**, a chronic disorder, characterized by the production of large quantities of urine of low specific gravity. It is a disorder particularly of young people, and is more frequent in males than in females. In the larger number of patients it seems to be of congenital origin. Its exact nature is unknown, although it seems to be related to some disturbance of the vasomotor mechanism in the kidneys. As a rule it is a disease of slow onset, the early symptoms being an increasing thirst and the passage of large quantities of urine. Occasionally there are pains in the thighs; the appetite is usually good; there is much thirst; the perspiration is small in amount, and the skin is apt to be rough and harsh. Otherwise the patients suffer but very little. It is a disease that is rarely prejudicial to health, having been known to persist for 50 years, and occasionally it passes away without treatment. Treatment is unsatisfactory.

Diabetes Mel'itus, a disorder of nutrition, in which there is deficient oxidation of the sugar in the body, which permits of the storing up of large amounts of sugar in the blood. This is eliminated in part in the urine, and there constitutes one of the most positive findings of the condition. It is a rare disease in America, but is less so in European countries, where it is from three to five times as common as here, although statistics seem to show that it is on the increase in the United States. The symptoms vary very widely. There is an acute form of the disease which proves rapidly fatal, but in the majority of cases there is a gradual onset, during which increased urination and increased thirst are the initial symptoms. Following this, if the disease progresses, the thirst still increases; there is passing of large quantities of urine containing glucose; very marked increase in the appetite, amounting sometimes

almost to voraciousness and gluttony; and an accompanying progressive emaciation. The skin is dry and harsh; temperature is often below normal; the tongue is bright red, and glazed; the gums may be swollen; and constipation is the rule.

As the disease progresses a number of complications are apt to arise; boils and pimples are extremely common; eczema and intense itching are frequent. Perforating ulcer of the foot may occur, and occasionally there is bronzing of the skin. Acute pneumonia is a frequent cause of death. Gangrene of the lung may also arise, and tuberculosis is contracted with great readiness. In most cases, particularly in the young, there is a form of progressive intoxication due to the gradual retention in the body of acids which are not properly neutralized by the body's protective agencies. There is gradually progressive anæmia, headache, delirium, great distress and marked hunger for air, which may be accompanied by blueness of the skin. Neuralgic pains are also frequent complications in diabetes.

The cause of diabetes mellitus is a matter of much inquiry, but it would seem that it is a disease of a number of origins. Fundamentally, however, it is due as implied at the beginning of this article, to some interference with the physiology of sugar-oxidation. This may result from disease of the pancreas, disease of the suprarenal gland, sometimes disease of the central nervous system, and occasionally disorder of the sympathetic system. The pancreas and the suprarenals are considered at the present time as the site of the chief changes leading to the production of this disease. The outcome is usually dark. In children, as a rule, it progresses rapidly to death. Middle-aged people may live for many years, but instances of cure in true diabetes are rare. The treatment is largely hygienic, and is extremely complicated. Diet and hygiene are the most important factors. Each patient having his idiosyncrasies, medical advice on the matter of diet is imperative. The patient, not the disease, needs treatment; hence general rules are more productive of harm than of good.

Diabet'ic Sugar (C₆H₁₂O₆), formerly supposed to be a distinct species of sugar, now found to be the same as glucose (q.v.). It is regularly produced by the liver, and is a constant though trifling constituent of healthy urine, but in diabetes mellitus (q.v.) it amounts to 8 or 10 per cent. See INOSITE.

Diablerets, dē-ā-blē-rā, **Les** (Fr. "the little devils"), a secondary mountain group of the Bernese Alps, Switzerland, between the canton Vaud and canton Valais. The highest peak is 10,620 feet. Two peaks have already fallen, and others threaten to follow. The rocks consist of limestone, resting at a high angle on beds of shale, which becoming disintegrated leaves the limestone without support, and causes tremendous landslips. The most disastrous took place in 1714 and 1749. By the former the surrounding district was shaken as by an earthquake, and many human beings and cattle perished; by the latter the course of the Liserne was arrested, and two small lakes formed.

Diacaustic (dī-ā-kās'tik) **Curve**, a curve of intense light, formed by the consecutive intersections of rays refracted through a lens.

DIACHYLON — DIAL

Diachylon, dī-āk'ī-lōn, a combination of oxide of lead or litharge, olive oil, and water. It is, in fact lead soap, insoluble in water, and sparingly soluble in alcohol, hard and brittle while cold, but soft on heating. It is used in surgery as the basis of adhesive plasters.

Diadem, a band for holding together the adjusted hair of the head, a wreath or chaplet for the head or forehead. In Oriental antiquity it was employed as a badge of royalty or nobility among the Egyptians, Assyrians and Babylonians. It was called *nefer* among the ancient Jews, and was worn as an ornament by kings and high priests, when it took the form of a golden circlet for the brows. Among the Persians, Armenians, and Parthians, the kingly and queenly diadem was a broad band of pale blue. Alexander the Great adopted this regal decoration after contact with the Persians, and his successors followed his example in this fashion. The Greeks early adorned their greater gods with the diadem, notably Zeus, Hera and Aphrodite, and it later became the universal ornament of their women, and their young men, especially the Olympic victors. These diadems were made of such various materials as metal and leather. Among the Romans Ancus Martius introduced the diadem from the Etruscans, but it was abolished on the expulsion of the kings. Which of the Cæsars revived its use is not known. According to some authorities Aurelian first assumed it. Its use among the non-Roman kings and princes of Europe appears to have been universal. Under Constantine the Great the imperial diadem was studded with gems and took a form which rendered it the prototype of the crowns worn by mediæval and modern monarchs.

Diæresis, dī-ēr'ē-sīs, in grammar, the resolution or separation into distinct syllables of two vowels whose juxtaposition has either caused them to coalesce or threatened them with coalition. In printing, a mark (") placed over the second of two adjacent vowels to indicate that they should both be pronounced: as, aërated.

Diagno'sis (Gr. from *dia*, through, and *gnōsis*, knowledge), in medicine, the discrimination of diseases. It includes the study of all the vital phenomena of diseases, and also of their appearances after death, in so far as this can aid their discovery during the life of a patient. It is usual to speak of rational or physiological diagnosis, or diagnosis by symptoms, that is, changes chiefly functional, observed by the patient; and of physical diagnosis, or diagnosis by signs, that is, objective phenomena appreciable by the senses of the observer. The latter method of diagnosis has been much enlarged in scope and increased in importance by the modern methods in medicine of auscultation and percussion (qq.v.) and also by the great advances made in physiological chemistry, and by the use of the microscope. Skill in diagnosis is one of the highest gifts of the physician.

Diagonal, Diagonal Line, a straight line joining two angles not adjacent, in a rectilinear figure. Every rectilinear figure of more than three sides may be divided by diagonals that do not intersect, into as many triangles as it has sides, minus two. To find the number of possible diagonals, take three from the number of

the sides, multiply the remainder by the number of the sides, and halve the product.

Diagoras (dī-äg'ō-ras) of Melos, Greek philosopher: d. Corinth about 412 B.C. He was a pupil of Democritus of Abdera. On account of his ridiculing the popular religion, he was charged with impiety, and received the surname of the Atheist. Fearing for his life, he fled from Athens and went to Pallene, and finally to Corinth.

Diagram, a figure or geometrical delineation applied to the illustration or solution of geometrical problems, or a description or sketch in general. Anciently, it signified a musical scale. Among the Gnostics the name diagram was given to a figure formed by the superposition of one triangle on another, and inscribed with some mystical name of the Deity, and worn as an amulet.

Dial, The, a famous American quarterly, the recognized organ of the Transcendentalists. It was published in Boston 1840-4. Its first editor was Margaret Fuller, 1840-2, assisted by George Ripley and Emerson, and for the remainder of its course it was edited by Emerson. It was reissued in 1902 with introduction by G. W. Cooke.

Dial, Sun, an hour-measuring instrument known from the earliest times to the Egyptians, the Chaldeans, and the Hebrews. The Greeks derived it from their eastern neighbors, and it was introduced into Rome during the first Punic war. The leading principles of dialing may be made intelligible to general readers by the following simple illustration.

Let P B ρ D represent the earth as a hollow transparent sphere, having an axis P E ρ , of

which P and ρ are the poles. Let the equator be divided into 24 equal parts, and through these divisions draw the meridians, *a*, *b*, *c*, *d*, etc. Let one of these meridians pass through any given place for which a dial is required to be made, and where that meridian cuts the equator let it be numbered XII. The opposite meridian must likewise be numbered XII, the other meridians being numbered as shown in the cut. This being done, these meridians will be the hour circles of the place on the first meridian; so that if the axis P E ρ were opaque, the sun

• • •

We have been considering the earth as the sphere, in our illustration of the nature of dials, but the earth's magnitude is so small compared with the distance of the sun, that no sensible error will follow in considering a small glass sphere similar to that above described, but placed on the surface of the earth with its axis parallel to that of the earth; then will the sphere show the hour of the day in the manner before specified. The only things absolutely essential for a dial are the axis and the plane, the places of the hour lines having been once determined. Dials may have various forms, many of which are exceedingly curious and intricate, and require for their construction the application of complicated trigonometrical formulae. We shall confine our attention here to the most common, and, at the same time, most useful form, that is, the plane horizontal dial. On the proposed plane, which may be either of marble, slate, or brass, draw the straight line P H S for the meridian or 12 o'clock line, and parallel to this draw 12, h S, leaving a space between them equal to the thickness of the gnomon. The gnomon is a thin triangular plate of metal, somewhat similar in shape to the figure A E B, the side A B being fixed into the plate of the dial, so that the gnomon shall stand perpendicularly, the line A E being directly north and south. The line A E is called the style, and the angle E A B is equal to the latitude of the place for which the dial is constructed.

2. Draw 6 H 6 perpendicular to 12 H S, and it will be the 6 o'clock hour line; make the angle 12 H F equal to the latitude of place, and draw

$$I_2, \begin{matrix} I, & 2, & 3, & 4, & 5, & 6, & 7, & 8, \\ II, & IO, & 9, & 8, & 7, & 6, & 5, & 4. \end{matrix}$$

The sundial is daily getting more rare in this age; but notwithstanding the superiority of the clock, why has the dial almost everywhere vanished? "If its business use," as has been well observed, "be superseded by more elaborate inventions, its moral use, its beauty, might have pleaded for its continuance. It spoke of moderate labors—of pleasures not protracted after sunset—of temperance and good hours. It was the primitive clock—the horologe of the first world. Adam could scarce have missed it in paradise. It was the measure appropriated for sweet plants and flowers to spring by—for the birds to apportion their silver warblings by—for flocks to pasture and be led to fold by. The shepherd carved it out quaintly in the sun, and, turning philosopher by the very occupation, provided it with mottoes more touching than tombstones."*

Although the use of provincial dialects becomes inconvenient after a language has

* "*Horas non numero nisi serenas*" ("I only count the hours of sunshine") was an ancient motto of great beauty and significance.

DIALECTICS — DIALOGUE

acquired a fixed literary standard, the study of such dialects is always valuable to the philologist for the light they throw on the history of the language. They frequently also retain beauties which have been lost in the received language, and with which, when they admit of being restored, it may still be enriched. No one who has studied the peculiarities of the Provençal, the Low-German, or the Alemannic dialects, or the Neapolitan, with its many remnants of the Greek, can be insensible of the interest and value of such investigations.

Italian was once the vulgar dialect; and, even now, to translate into Italian is called *volgarizzare*. It was corrupt Latin mixed with barbarous words derived from the idioms of the conquerors of the country, and was used at first only by the lower classes; it then became the general dialect of common life; and at last Dante dared to adopt the "vulgar dialect," and to stamp it as a legitimate language.

Spanish and Portuguese were cognate dialects, and might, like the different dialects of the Spanish provinces, have become one language, if the two nations had not been separated politically.

In Germany no dialect has ever obtained entire ascendancy. Much was once written in Low-German, and the activity of the Hanseatic League, and the wide extent to which it was spoken, gave it much influence. Charles V., born at Ghent, spoke Low-German; but Luther's translation of the Bible, like Dante's 'Divina Commedia,' made High-German the literary language. Only the fundamental characteristics of the language of Upper Germany have remained in High-German. In other respects it has developed itself independently of any provincial dialect.

Of English there are but two distinct literary dialects, the modern English and the Scottish, which is derived from the same Saxon stock. It has often been observed, however, that no country has more variations from the common literary language. The Scottish dialect exists in its purity only in the early poets, historians, and other writers of the country. Most of the modern literary Scotch is only a hybrid English made up by an infusion into the common language of local words and colloquial expressions. Every county has its peculiarities, which are sometimes striking and difficult to be understood. It is evident that, although there never has existed a country so vast, and a population so large, as that of America, with so little variety of dialect, the work of development and decay is palpably going on in American Anglo-Saxon. To begin with, the dialect of the French Canadian is vivid and picturesque. That there are several distinct dialects in the United States is proved not only by the dialect literature of the East, the West, and the South, and dialect of the slums in New York, but also by the scientific publications of the American Dialect Society. The 'Dialect Notes' of this society furnishes much valuable information on this subject, and 'The Ithaca Dialect,' in which a local New York State dialect has been investigated by O. F. Emerson shows that the differentiations of language in distinct sections will some day furnish abundant and interesting material for the student of dialect.

Dialectics (literally, the art of conversation, debate, dispute, exchange of ideas in dialogue), hence the art of reasoning. By Socrates every inquiry was pursued between disputants, or controversialists, catechetically, that is, by proposing and answering questions. The great dialectic weapon of Socrates was a question which forced the man to whom it was proposed so to answer as to surrender the position he had first maintained, and admit the conclusion of his adversary. This was the famous Socratic elenchus. The dialectics of Aristotle comprise the doctrine of simple words, delivered in his book of 'Predicaments'; the doctrine of propositions, contained in his book, 'De Interpretatione'; and that of the several kinds of syllogism, in his books of 'Analytics,' 'Topics,' and 'Elenchuses.' The great instrument of Aristotle was the syllogism, invented and elaborated by him, the radical principle of which is, what is true of a whole is true of its part. The syllogism afterward became the main instrument of dialectics to the schoolmen, and until the time of Bacon, the accredited line of thought on which to enlarge the field of human knowledge. In modern times various systems of dialectics have been propounded in different countries; but by no philosophers, either ancient or modern, has this science been more cultivated than by the Germans, who, among a host of other names more or less distinguished, can boast of Fichte, Kant, Leibnitz, Hegel, Schelling, and Schlegel, as the propounders each of a dialectical system.

Di'aling, the art of making sun dials; also the art and practice of mine-surveying, in which the theodolite, magnetic needle, etc., are employed. See DIAL, SUN.

Diallage, dī'āl-lāj, a variety of the mineral pyroxene, near diopside in composition and therefore a calcium-magnesium silicate. It is easily altered by uralitization (see URALITE) to smaragdite. It has a distinctly lamellar structure, is usually of grayish to grass-green or brown color and pearly or metalloidal lustre. Its hardness is 4, and specific gravity about 3.3.

Di'ologue, a conversation or conference between two or more persons. The word is particularly used in reference to theatrical performances, and to written conversations, or a composition in which two or more persons are represented as interchanging ideas on a given topic. The ancient philosophers, especially the Greeks, from their peculiar vivacity were fond of this form; they used it for the communication of their investigations on scientific subjects. The dialogues of Plato are a sort of philosophical drama. The Socratic dialogue consists of questions and answers, and the person questioned is obliged, by successively assenting to the interrogatories put to him, to come to the conclusions which the questioner wishes to produce. The Socratic method has been adopted in modern times as a means of instruction in certain schools. Lucian claimed to be the inventor of humorous dialogue (see DIALOGUES OF THE DEAD). Erasmus of Rotterdam, and subsequently, among the Germans, Lessing, Moses Mendelssohn, Engel, Herder, Jacobi, Solger, have written in this form. In comic and satiric dialogue Wieland has imitated Lucian. Among the most distinguished Italian

DIALOGUES OF THE DEAD—DIAMOND

writers of dialogue are Petrarch ('De vera sapientia'), Machiavelli, Gelli, Algarotti, and Gozzi; and among the French, Sarrasin, Malebranche, Fénelon, and Fontenelle. Among the English, Bishop Berkeley and Hurd have imitated Plato, and Harris, Cicero. Lord Lyttelton's 'Dialogues of the Dead,' and Addison's 'Dialogues on Medals,' are well known, but Landor's 'Imaginary Conversations' is the finest production in English belonging to this class of works. In the drama, the dialogue, in a narrower sense, is opposed to monologue or soliloquy; in the opera, it is that which is spoken, in opposition to that which is sung.

Dialogues of the Dead, satirical dialogues by Lucian (q.v.), written at Athens during the latter half of the 2d century. They have been frequently translated from the days of Erasmus to the present. The scene is laid in Hades. Among the characters introduced or referred to are: Menippus and Diogenes, the Sophists, and the Cynics, Aristotle, Alexander, Socrates, and Croesus. The decadent Olympian religion is exposed to ridicule, and it is demonstrated that the conception of fate logically destroys moral responsibility. In the dialogue regarding Charon and his passengers, the futility of riches and fame is shown, only sterling moral qualities availing in the shadowy land of Hades. Lord Lyttelton also wrote 'Dialogues of the Dead,' introducing some modern *dramatis personæ*, including Cortez, William Penn, Ximenes, Wolsey, Boileau, and Pope; and Fontenelle's 'Dialogues des Morts' should be noted as embodying a similar idea.

Dialysis, the separation of the crystalloid constituent elements of a mixture from the colloid, the former being bodies which diffuse readily, such as sugar, salt, bichromate of potassium, etc.; the latter bodies which diffuse with difficulty or not at all, bodies resembling glue or gelatin, such as gum, starch, caramel, albumen, the ordinary constituents of food, etc. The dialysis is effected by pouring a mixed solution of crystalloid and colloid on a sheet of parchment paper stretched over a wood or gutta-percha hoop, having its edges well drawn up, and confined by an outer rim. The parchment is allowed to float on a basin of water. In a short time all the crystalloid bodies will have passed through the membranous septum into the pure water, while the colloid matter will remain almost entirely in the dialyzer.

Diamagnetism, the moving of bodies such as iron, when placed in a field of magnetic force, from places of weaker to places of stronger force. The opposite is true of bismuth and other substances. Such substances are said to be diamagnetic. See MAGNETISM.

Diamantina, Brazil, a city lying somewhat north of the centre of the state of Minas Geraes, in a region formerly well known on account of its abundant production of diamonds. At the present time the wealth of the state is derived from agricultural and manufacturing industries; nevertheless Diamantina continues to prosper, being well situated with reference to the São Francisco River system, and the routes of travel between Rio de Janeiro and the interior. Its climate is good, owing to its elevation above sea-level (about 4,000 feet). Pop. (1901) 14,000.

Diameter, a straight line drawn through the centre of a circle, and terminated both ways by the circumference. It thus divides the circle into two equal parts, and is the greatest chord. The radius is half this diameter, and consequently measures the distance between the centre and circumference of a circle. The length of the diameter is to the length of the circumference of the circle as 1 is to 3.14159265 . . . , the latter number being an interminable decimal.

Diamond, a natural form of carbon, highly valued as a precious stone when transparent and of the crystalline form. It is of less

value than the ruby, and rubies of from two to four carats are frequently worth twice or four times the value of fine diamonds. A diamond crystallizes in the cubic or monometric system, its common form being the regular octahedron or a modification of it. The faces are often curved and the general form of the crystal is more or less rounded. The surface of the diamond frequently exhibits striae and triangular impressions, while the interior may contain microscopic cavities and various inclusions, often black carbon. It is the hardest substance known, but in spite of this hardness it is very brittle and cleavable; specific gravity, 3.52. It is generally colorless, but sometimes tinged with pink, red, orange, yellow, green, blue, brown, or black. Blue, red, and green are exceedingly rare colors. The finest deep red diamond known is that in the possession of the Russian crown, purchased in the time of the Emperor Paul of Russia. Light yellow, straw, and brown are the most common colors; rich yellow and browns are also highly prized. Some bluish-white Brazilian diamonds are phosphorescent in the dark after exposure to the sunlight. The color is attributed to the presence of a possible hydrocarbon, called Tiffanyite. This phosphorescence is a property peculiar also to alizarin. The brilliancy of the gem is caused by the black planes reflecting all the light that strikes them at an angle exceeding $24^{\circ} 13'$. The index of refraction is 2.439, being exceeded only by that in chromate of lead and orpiment. The diamond is unaffected by any liquid and infusible at the highest attainable temperature. It gradually burns away before the oxy-hydrogen blowpipe, or in the electric furnace, or when it is heated red-hot and plunged into an atmosphere of oxygen, carbonic acid then being produced. Exposed to the intense heat of the voltaic arc, the diamond becomes converted into graphite. Be-

Natural Crystal.

The surface of the diamond frequently exhibits striae and triangular impressions, while the interior may contain microscopic cavities and various inclusions, often black carbon. It is the hardest substance known, but in spite of this hardness it is very brittle and cleavable; specific gravity, 3.52. It is generally colorless, but sometimes tinged with pink, red, orange, yellow, green, blue, brown, or black. Blue, red, and green are exceedingly rare colors. DIAMOND

sides its value as a gem it is of great use in the arts and manufactures. Diamond dust is used for cutting and polishing other gems, for slicing gems of all kinds, agate, jade, and other hard substances. The edge of a native crystal rounded is used by glaziers for cutting glass, for engraving glass, steel, and other substances; the cut is generally to a depth of only 1-100 of an inch, but determines the direction in which the glass shall break; a cut of this depth, while scarcely showing, breaks well, whereas a deep scratch does not. A sharp point is used for engraving on glass and other hard substances; a splinter is also used as a tool for turning glass lenses in a lathe; and rough diamonds, too imperfect to be used as gems, are mounted as boring tools for perforating the softer rocks. In the amorphous black variety, carbon, carbonado, or bort is used for boring hard rocks; it sells for \$30 a carat, the value per carat of a fine transparent rough diamond of from one to two carats, as scarcely $33\frac{1}{3}$ to 40 per cent of the crystals is left in the gem after the operation of cutting.

Originally diamonds were preserved in their natural form, but in 1456 Louis de Berquin or Bruges discovered the art of polishing them on rotating disks with diamond dust. These circular disks, about 10 centimetres in diameter, are of soft steel covered with diamond dust and oil, and made to revolve at 3,000 revo-

Great Table Stone of India.

lutions a minute. This gives the diamonds the artistic smooth surfaces and sharply defined edges. They are secured in a fusible metal dop or holder, held by a metal clamp to the wheel. The process is slow and tedious, and requires great skill to produce fine results. Until a few years ago Amsterdam was the great diamond-cutting centre of the world, but the finest cutting is now done in the United States, and in a great measure by machinery. As to the cutting process: Diamonds are, first, cleaved; that is, along the line of cleavage of the stone a tiny cut is made by rubbing the stone with another diamond at the point where it is desired to cleave it, then a dull knife-edge is placed in the cut, and a sharp blow will separate the stone on a cleavage plane. Secondly, diamonds are cut by rubbing two diamonds together ("diamond cut diamond," as the old adage says), the stones being cemented with shellac to two pieces of wood or handles which are held in the hands, and rubbed together till they are of the desired form. This also has been superseded partly by an American machine. The diamond-cutting trade is carried on by 8,000 jewelers, and over 30,000 people are employed in preparing and

setting the gems. A "rose" diamond is one which is quite flat underneath, with its upper part cut into 12 or more little faces or facets, usually triangles, the uppermost of which terminates in a point. A "table" diamond is one which has a large rectangular face on the top, surrounded by four lesser rectangles. A "brilliant" diamond is one which is cut in faces both at top and bottom, and the table or principal face of which is flat; there are 32 faces on the top above the girdle, and 24 on the back, exclusive of the table on the top and the inlet on the back, 58 in all. The greatest amount of brilliancy and beauty is developed in the diamond by the "brilliant cut"; 98 per cent of all modern cut diamonds are cut in this form. Very few are at present "rose cut" or "table cut," though rose cut has been more or less in vogue from the 17th century; table cut was in vogue during the 15th and 16th centuries. The finest brilliant in the world to-day is the "Jubilee" diamond, shown at the Paris Exposition of 1900; this was a brilliant of 239 carats of wonderful brilliancy and purity, and was found at the Jagersfontein mine in South Africa.

The Shah.

Diamonds of from 1 to 22 carats each have been found in 24 localities in the United States. The combustibility of diamonds was proved in 1694 by Averani and Targioni with the aid of burning glasses. That diamonds turned to carbonic acid when burned was proved by Lavoisier in 1772. Many curious superstitions are connected with the diamond. It was supposed to show phenomena of sympathy and antipathy. It was fallaciously believed that the diamond, which resisted the two most powerful things in nature, iron and fire, might be destroyed by the blood of a goat; that, if it was macerated in fresh blood, it could not be destroyed by being struck on an anvil, etc. It was believed also to show a curious rivalry with the magnet, to strengthen poisons, and sometimes to drive away madness.

That the diamond was known to the ancients is extremely problematical. Only two diamonds are mentioned by Castellani as existing in antiquity in a small gold statue, and even this allusion is doubtful. Therefore we may safely say that when the Prophet Jeremiah speaks of diamonds under the name of shamir as a tool for engraving; when Ezekiel and Zechariah compare the stubbornness of the Israelites to the diamond, and when the Greeks and Romans speak of the stone under the name of adamas or adamant, the "unsubduable," the stone referred to was really the corundum. There does not exist in a single antiquarian collection in Europe a stone of the mineral which we now call diamond; the earliest authentic specimen known

Star of the South.

DIAMOND

being the stone set in the ring of Charlemagne, an octahedral diamond. Any other reference can only mean the corundum or sapphire, the stones which are next in hardness to the diamond, and which could both have been used for engraving nearly all the gems of the time. Pliny mentions this stone as being the most valuable of the possessions of man.

Authors and composers of Eastern tales long wrote of diamonds as being found in India only, and chiefly in the mines of Golconda—a misnomer, as Golconda was the market, not the mine; and diamonds from many mines were sold there. But ever since the year 1728 these stones have been found in great abundance in Brazil, no less than 1,146 ounces having been taken from there to Europe in 1730. In 1829 a vein of diamonds was discovered in the Ural Mountains; and in 1867, in South Africa, John

The Pasha of Egypt.

O'Reilly, a trader and hunter, reached the junction of two rivers, and stopped for the night at the house of a farmer named Van Niekerk. Children were playing with some pebbles they had found in the river. O'Reilly took one of these pebbles to Dr. Atherstone at Cape Town, who said that it was a diamond of 22½ carats. It was sold for \$3,000. Niekerk remembered that he had seen an immense stone in the hands of a Kafir witch-doctor, who used it in his incantations. He found the man, gave him 500 sheep, horses, and nearly all he possessed for the stone, and sold it the same day to an experienced diamond buyer for \$56,000. This was the famous "Star" of South Africa. It weighed 84½ carats in the rough, and was found to be a gem quite the rival of an Indian stone in purity and brilliancy. After it had been cut it was bought by the Earl of Dudley, and is now known as the Dudley diamond. By 1869, parties in ox-wagons had worked their way over the plains to the Vaal River. Soon a tented city of 12,000 or more foreigners grew at Pniel and Klipdrift, on the opposite banks of the stream, where diamonds were found plentifully. Soon hundreds of cradles, like those used by the Australian gold-diggers, were rocking on the edge of the stream, supplied with the precious gravel by a large force of diggers, sievers and carriers. The mines at Kimberley, 600 miles from Cape Town, are of exceeding value, the richest in the world. The output of a single mine, the "Kimberley," is \$4,000,000 annually, and within 10 years this district has yielded about \$58,000,000 in dividends. Ninety-five per cent of all the diamonds produced in the past 20 years came from South Africa; of these over 90 per cent came from the De Beers mines, limited, a consolidation of all the African mines in and about Kimberley; 5 per cent from the Orange River Colony and elsewhere, the latter usually of great purity. The capitalization of the De Beers mines is at the present market value about \$100,000,000.

Most of the miners are natives, who are kept in compounds for periods of from three to six

months; this system has broken up the illicit diamond buyers' ("I. D. B.") system, which seriously threatened the successful working of the mines. The chairman of this syndicate was Cecil J. Rhodes (q.v.), who by his genius and will created the corporation apparently out of chaos, and regulated the value of diamonds for over 12 years, the result being of great benefit to the jewelers of the world. The buying and selling of the gems is controlled by the government. Since the organization of the De Beers mine, in 1888 to 1 Jan. 1900 there have been mined 35,000,000 loads of earth of 1,600 pounds each; these have yielded 31,000,000 carats of diamonds, valued at \$200,000,000. The total African yield from the opening of the mines to the present is about \$350,000,000, after cutting \$700,000,000 worth of diamonds. Since 1867, duty has been paid on \$240,000,000 worth of diamonds and precious stones, and it may be safely said that \$500,000,000 worth are owned in the United States.

The Kohinur.

The Polar Star.

The total value of all the diamonds known to exist in the world to-day is at least \$1,000,000,000. Therefore it may safely be said that one half of all the diamonds known are owned in the United States.

Most of the great diamonds distinguished for beauty and size have very interesting histories. One of the most famous is the Kohinûr, or Koohinoor, "Mountain of Light." The legend is that it was carried 5,000 years ago by the hero Karna, whose deeds are celebrated in the "Mahabharata." It made its first appearance in history in the 14th century, when Ala-ed-din brought it to Delhi. At that time it was supposed to weigh 793 carats. When in 1673 the Grand Mogul sold it to Tavernier, it weighed only 279 carats, having been injured by the lack of skill of a Venetian lapidary. It was brought in 1739 at the sack of Delhi to Afghanistan. Thence it came into the possession of the East India Company, which presented it in 1850 to the English crown. It was recut in 1852 and now weighs 106 1-16 carats.

What is said to be the largest stone in the world was sent to London from the Jagersfontein mines in South Africa in 1893. It weighed 971 carats or nearly half a pound, and was three inches in length. It is in process of being cut in Amsterdam, and is of a fine color. Another

The Orloff.

DIAMOND

weighed 640 carats. A pre-historic diamond mine is believed to have been discovered near Winburg in the Orange River Colony, a hundred feet in depth and with tunnels branching off for several hundred feet. In these were found primitive tools, armor and weapons, and the skeletons of men who must have been above the average stature of any race of the present day. The natives have no traditions concerning them.

Another important diamond is the one at the point of the sceptre of the Russian empire, known as the Orloff, which weighs 194¾ carats. At one time it formed the eye of an idol in the temple of Seringham in Mysore, whence it was stolen. It was in the throne of Nadir Shah, and after his murder it was bought by an Armenian merchant in 1772 at the price of 450,000 silver rubles and the title of nobility. By the gift of Prince Orloff, a favorite of Catharine II., from whom it derived its name, it came into her possession. Some writers think that this and the Koh-i-Nür are the two parts of the "great mogul" diamond. The supposed great diamond of the king of Portugal, 1,770 carats, is a rolled oval pebble of white topaz.

The Regent or Pitt diamond was, till the recent opening of the South African mines, for over a century, one of the most perfect and beautiful diamonds in existence. It weighs

The Great Mogul.

136.75 carats, and is of the purest water and most perfect shape. It came from the East Indies and was sold by a sailor to Pitt, governor of Ft. St. George. From him it came into the hands of the Duke of Orleans at the

time of the French revolution. It was in pawn at the hands of a merchant by the name of Trescow. Afterward it decorated the sword hilt of Napoleon I., and is now in the Galerie d'Apollon in the Louvre.

One of the finest of diamonds is the Sancy diamond, 53½ carats, of exquisite shape and perfect water. It has been traced back to Charles the Bold, who lost it in 1477 at the battle of Nancy. It came through many private hands to the Huguenot nobleman Sancy. When Sancy was sent as an ambassador to Solothurn, he received from Henri III. the command to send to him that diamond as a pledge. The servant to whom it was entrusted was attacked and murdered, but instead of giving up the diamond he swallowed it. Sancy had the body opened and found the precious diamond in his stomach. James II. procured it when he came to France in 1688. Later it came into the possession of Louis XIV. and was worn by Louis XV. at his coronation. In 1835 it was sold to the Russian emperor for 500,000 rubles. In 1865 it came into the hands of Sir Jamsetjee Jeejeebhoy, and in 1889 was again in the market; the price asked was 100,000 rubles. It is owned by a collector, who paid \$70,000 for it.

One of the most superb diamonds known is the sapphire-blue brilliant Hope diamond, valued at about \$100,000. It is believed to have been cut from a blue diamond weighing in the rough 112½ carats, sold by Tavernier to Louis XIV., and which disappeared in the troubles of 1792. The largest diamond ever found in Brazil weighed 254½ carats, and was discovered in 1853 by a negress in the river Bogageno; it is known as the "Star of the South." It was sold to the Gaekwar of Baroda for \$450,000.

The Regent or Pitt.

From 1750 to 1870 the value of a diamond was fixed on a basis of the square of its weight; that is, a 1-carat stone was worth \$100, a 10-carat stone was worth—10 x 10 x 100—\$10,000. This was due to the fact that large stones were rare. But in the African mines, large stones are found, and the increase in value from one carat up is worth only a fraction more per carat than the carat weight would show. When brilliants are exceedingly small the value per carat may be double that of stones weighing one sixteenth to one fourth carat each, owing to the difficulty of cutting. The term "first quality" signifies a stone absolutely white and free from all flaws and imperfections. Imperfections, even if slight, or a tint of undesirable colors, greatly lower the value of a diamond.

As the diamond is known to be nothing but a crystalline form of common carbon, many attempts have been made to manufacture it by artificial means. No great degree of success has yet rewarded these efforts, although very small diamonds of apparently good quality can be prepared by methods now known. Carbon being practically infusible, it has not been found feasible to induce crystallization by causing the carbon to solidify from a molten condition. Free carbon is soluble in but few substances, and from such solutions as can be prepared it is deposited mainly in the form of graphite. It dissolves to a considerable extent in melted platinum, but when the metal is allowed to cool and solidify, the carbon is all thrown down as graphite, and no diamonds are obtained. Of the more successful experiments of this sort, those of Moissan are best known. Moissan made use of the known fact that carbon will dissolve to some extent in melted iron. Under ordinary conditions the carbon is here also deposited in the graphitic form; but Moissan found that when the solution is allowed to cool under an exceedingly great pressure a small portion of it appears in the form of minute crystals that possess all the properties of the true diamond, even exhibiting the peculiar pittings on the surface that are characteristic of the natural stone. His method consists in saturating the molten iron with carbon and then pouring it into a mold, and chilling the casting

The Sancy.

DIAMONDBACK TERRAPIN — DIAMOND INDUSTRY

as quickly as possible by immersing it in water. The outer layers solidify under this treatment, while the interior is still quite fluid, and the powerful contraction of the surface gives rise to an enormous internal pressure. As the fluid core solidifies, the greater portion of the carbon that it contains is deposited in particles that are distributed throughout the mass. The casting, when entirely cool, is dissolved in acids, and the residue is treated in various ways to effect the removal of the graphite and amorphous carbon. A small precipitate remains behind, in which tiny crystals of diamond may be distinguished. No stones that are large enough to be of commercial value have yet been prepared, and while the process is of great theoretical interest, it is far too expensive, in comparison with the yield, to be practicable even for the manufacture of diamond powder for polishing and grinding purposes.

GEORGE F. KUNZ.

Diamondback Terrapin (*Malaclemmys palustris*). This far-famed turtle belongs to the family *Emydidæ* (q.v.) and may be recognized by the unhinged plastron or lower shell, the concentric grooves and ridges which mark each plate of the upper shell or carapace, the smooth unnotched jaws, smooth skin covering the head, and dark olive or black color. Unlike most terrapins, the diamondback inhabits salt and brackish waters, living in the marshes which fringe our seacoast from Cape Cod to Texas. Formerly very abundant throughout this region, the constant extensive fishing to supply the markets has greatly reduced its numbers, so that the problem of its artificial propagation is now being taken up seriously. The principal fisheries are in Chesapeake Bay and on the coasts of New Jersey and North Carolina. Although a considerable number are dug from the mud while hibernating, a much larger proportion are captured by means of traps, seines, etc., during the summer months, and are confined in pens, where they are fed on oysters, fish, and celery to fatten them for the winter market. From the point of view of the epicure, the diamondback is perhaps the most famous and esteemed product of American waters, and during the season of greatest demand commands almost fabulous prices. Those commonly sold have a length of shell of from five to eight inches, and are supposed to be from 6 to 10 years old. The habits differ but little from those of other terrapins. They are omnivorous, lay their eggs in June and July in small nests excavated in some warm sandy bank, and hibernate during the winter after burying themselves a few inches beneath the mud. See TERRAPIN.

Diamond-beetle, the *Entimus imperialis*, a splendid coleopterous insect belonging to the family *Curculionidæ* or weevils. The ground color is black, but the insect is covered by a large number of scales which appear brilliantly green by reflected light. It is very abundant in some parts of South America.

Diamond-bird, an Australian bird (*Pardalotus affinis*), of beautiful plumage, receiving its English name from the peculiar markings of its feathers. Its general color is gray and white, but spotted with red, yellow, orange, and black. It makes its nest in old tree-trunks, and

sometimes burrows in the ground, or utilizes any chance excavation. It feeds on insects.

Diamond Gauge, a gauge for estimating the size of diamonds. In the staff are set crystals of graduated size, by which jewels are compared. The crystals are from one quarter to one sixty-fourth of a carat.

Diamond Industry, a most important and far-reaching department of national and international commerce, which is spreading and increasing, year by year, especially in the United States. The diamond has been a precious stone procured with difficulty, treasured up with jealous care, and sought after by the rich and magnificent for ages. Diamonds are also indispensable for instruments employed in some of the manufacturing and industrial arts. A consideration of the diamond industry must include an account of the mining, polishing, importation, and sale of this gem. The distribution of diamonds in the geological formations of the world, their mining, etc., has been dwelt upon under the article DIAMOND (q.v.). It remains to point out some recent industrial facts of importance, with regard to the separation of diamonds from the concentrates, which remain when the diamantiferous earth has been washed, after being brought to the surface at Kimberley; their importation to this country, and their artificial manufacture. In mining diamonds, it was necessary until recently to go very carefully over the concentrates to pick out the garnets and many other foreign substances until nothing remained but the rough diamonds. This is a slow and laborious operation, but it has been an essential part of the mining industry until it was superseded by a discovery made a while ago. The discoverer was Mr. Fred Kersten, one of the employees in the sorting room. His discovery was accidental. A rough diamond and a garnet happened to be lying on a small board on the bench where he was working. He happened to pick up one end of the board when the garnet glided off, but the diamond remained. Kersten found that there was a coating of grease on the board which had retained the diamond, while the garnet slipped off. He procured a wider board, coated one side of it with grease and dumped a few handfuls of concentrates on it. Then he found that by holding the board in a slightly inclined position and vibrating it, all the concentrates except the diamonds moved to the lower end and fell off while the diamonds remained in place. Then he invented a machine by which his discovery might be utilized. The invention was an entire success. All the garnets and other minerals that are not wanted pass over the surface of the table, while every diamond, large or small, is retained. The entire work is now done by machinery, and both the young inventor and the owners of the diamond mines are profiting by the new labor-saving device. The United States is a very large purchaser of diamonds. One third of the entire amount of cut stones is owned in this country. The importations are increasing.

More than \$30,000,000 worth of diamonds and other precious stones were brought into the United States last year according to the statistics of the Department of Commerce and Labor. This is the largest importation of diamonds and other precious stones ever shown in a single year of United States commerce. Prior to 1887

DIAMOND INDUSTRY

the total had seldom, if ever, reached \$10,000,000 per annum; from 1887 to 1893 the total gradually moved upward until it reached \$16,000,000; then it rapidly fell to \$5,500,000 in 1894, \$7,500,000 in 1895, \$6,750,000 in 1896, and \$2,500,000 in the fiscal year 1897. In 1898 the total increased to nearly \$9,000,000, in 1899 to over \$14,000,000, in 1901 to \$20,000,000, in 1902 to \$23,000,000, and in 1903 will be fully \$30,000,000, making the total for the year just ended not only more than in any preceding year, but 50 per cent in excess of 1901, double the figures of 1899, and more than six times the average during the period 1894-7.

This rapid growth in the importation of diamonds, while it suggests general prosperity, also seems to indicate the development of a comparatively new industry in the United States—the cutting of diamonds. The total importations of diamonds alone in the 11 months ended with May amounted to \$24,000,000, and of other precious stones \$4,500,000. Of the \$24,000,000 worth of diamonds imported, \$10,000,000 were uncut diamonds; this total of \$10,000,000 of uncut diamonds is a large increase compared with the importations of uncut diamonds in preceding years, the figures for 11 months of the year 1902 being \$5,500,000, while for the corresponding period of 1901 they were \$6,500,000, for the corresponding months of 1900 \$3,500,000, and for the corresponding months of 1898 but little over \$2,000,000.

The diamonds imported are divided by the bureau of statistics statements into two groups, namely: "Diamonds uncut, including miners', glaziers', and engravers', not set," and "Diamonds cut, but not set." The value of diamonds uncut, including miners', glaziers', etc., imported in 11 months ended with May has grown from \$2,500,000 in 1898 to \$10,000,000 in 1903, while that of diamonds cut but not set has grown from \$4,000,000 in 1898 to \$14,000,000 in 1903, these figures being in each case for the period of 11 months. This inference that the cutting of diamonds is becoming an important industry in the United States is strengthened by the fact that the census statistics of "lapidary work" show that the total value of production of lapidary work in 1900 was over \$5,500,000, against less than \$500,000 in 1890, and that the value of the materials used in this work in 1900 was over \$4,500,000, against less than \$250,000 in 1890.

It is indeed worthy of note that although the largest percentage of diamonds is cut outside of the United States, and all of them mined in other countries, the most improved machinery and many of the patented devices for mining and cutting have been the products of American ingenuity. Even Gardner F. Williams is an American born and bred.

Although the annual production of diamonds has increased more than 1,500 per cent in the last 30 years, and though there are produced at the present time more than 3,000,000 carats annually, as against 200,000 before the discovery in South Africa, the changed condition has come about in such a manner that the stone has not been cheapened in value, has been fixed on a more even market basis, and has that much enriched the world.

The cutting branch of the industry has almost doubled in the past eight years, and now keeps employed between 700 and 800 men. Nearly five sevenths of the diamond cutting of the

world is done in Amsterdam and Antwerp, though New York has recently begun to make its influence felt in that direction. There are about 9 or 10 cutting establishments in New York and Brooklyn, employing from 40 to 80 men each, and although the wages paid to American workmen are much higher than those paid in Europe, the advantage of better machinery in this country averages the cost of cutting. This is especially true in regard to large stones, though not always so with respect to stones running below an eighth of a carat.

Details of the artificial manufacture of diamonds in an electric furnace by Prof. Henri Moissan, at the University of Paris, were published in June 1903. His experiments were begun after his finding of microscopic diamonds in nature, in the "blue earth" from the Cape, in the sands of Brazil, and in several meteorites. His researches showed that if carbon was produced at low temperatures it was always obtained in the amorphous condition and no crystals were found. The details of the manufacture are thus described:

"For his experiment, Prof. Moissan utilized the pressure which is produced in iron when it passes from the liquid to the solid state. It is known in fact that solid iron is less dense than when in fusion, as is shown by the fact that pieces of the metal will float on the melted bath, and it thus resembles water in this respect. He melts the iron in the electric furnace and saturates it with carbon, and to carry this out 200 grammes of Swedish iron cut into cylinders half an inch long and two fifths inch diameter were placed in a carbon crucible and completely covered with powdered charcoal. The crucible was placed under the arc and heated during 3 to 6 minutes with a current of 350 amperes at 600 volts. The cover of the furnace was removed and the crucible seized with a pair of tongs and plunged quickly into a bath of cold water. The crucible and metal remain red for a few moments, giving off gases which come to the top, then the whole cools off. It was not without apprehension that the experiment was made for the first time, as it was feared that an explosion would be produced when the melted mass at 3,000 degrees came in contact with the cold water. But no bad effect is produced by the meeting of the hot mass and the liquid; and during the first period the mass is cooled rather by a rapid radiation. In order to cool it by conduction, and thus more quickly, it was placed in iron filings. In this way the diamonds which were obtained were of a peculiar nature, and they contained specks of black carbon. The pressure seems to be less, and the transformation of the carbon into the diamond is less complete. The experiment is, however, highly instructive, as it gives a form of speckled diamond which is also found in nature. To obtain a more rapid cooling, a bath of melted lead was found the best; it was kept at about the fusing point, or 617° F. The crucible, heated as before, is quickly plunged into the bath of melted lead, which is about 6 inches deep. The iron, which is lighter than the melted lead, is detached from the crucible in masses which tend to form spheres and rise more or less rapidly to the top. When the iron is saturated with carbon in the furnace, it becomes so pasty that the crucible can be turned over and it will not run out, but when it cools off the metal soon becomes liquid and gives up graphite.

DIAMOND-JOUSTS — DIANA

"The smallest spheres, half an inch in diameter, were solid and sufficiently cool on coming to the top. These spheres gave a good yield of diamonds and the latter were especially clear and brilliant, and the spotted form was absent. Some of the crystalline forms were very sharp. One of the transparent diamonds measured as high as 0.57 millimetre, and had a somewhat triangular form with the angles rounded off. It was perfectly clear. It is curious to note that three months after its formation it split into two pieces; this fact is significant, as some diamonds from the Cape show an identical action, this being no doubt due to irregularities of pressure at the time of formation. The samples of diamonds obtained by this method were interesting to examine as to their different form. Most of them were smooth and brilliant, while others had a grained surface. All the specimens had the particular lustre which is characteristic of the native diamond. When a ray of light is sent into the interior they appear to become luminous. Some of the specimens are cubes and octahedra, with rounded angles."

Diamond Jousts, jousts instituted by King Arthur, "who (according to the Arthuric legend as set forth by Tennyson) by that name had named them since a diamond was the prize." Before he was king he came by accident to a glen in Lyonesse, where two brothers had met in combat. Each was slain; but one had worn a crown of diamonds which Arthur picked up, and when he became king offered the nine diamonds as the prizes at nine several jousts, "one every year, a joust for one." Lancelot had won eight and intended to present them all to the queen, "when all were won." When the knight at last laid them all at her feet, Guinevere, in a jealous rage, flung them out of the palace window into the river.

Diamond Necklace, a jewel the incidents connected with which have furnished materials for one of the best historical romances of Dumas. This necklace contained 500 diamonds, was valued at some \$400,000, and was made by order of Louis XV. for his mistress, Madame Du Barry. The necklace was not finished in the king's lifetime, and after his death the Du Barry was banished. Between the years 1783 and 1784 the charms of Queen Marie Antoinette had infatuated the Prince-Cardinal Rohan, who was led to believe, by the so-called Countess Jeanne de Lamotte-Valois, an unprincipled adventuress, that the queen reciprocated his feelings. The cardinal was informed that the queen was anxious to purchase the diamond necklace and wished for him to become surety for the price to the makers, MM. Boehmer and Bassaenger. The cardinal agreed to become security, the necklace was delivered, but never reached the queen. Jeanne de Lamotte and her husband, meanwhile, had disappeared from Paris, and were selling the diamonds in parcels. The plot was discovered when the jewelers went to court complaining that the necklace had not been paid for. The cardinal and others concerned were thrown into prison. As the trial established rather the folly than guilt of any one excepting the Countess Lamotte, she and her husband were branded on the shoulders as thieves, and sentenced to a life imprisonment. The resultant scandal greatly aggravated that popular rage which terminated in the French Revolution.

Diamond-snake, an Australian serpent (*Python spilotes*). This is a richly colored snake belonging to the true pythons. It inhabits every portion of Australia, particularly Victoria, where the rocks and watered woods afford protection. It is a nuisance to farmers, as it robs the poultry-yards. It is not venomous, but can inflict a painful bite. The markings on the scales give it its name.

Diamond State. See DELAWARE.

Diamond Wedding, the celebration of the 75th anniversary of a wedding, at which presents of diamonds are given. Other anniversary weddings sometimes celebrated are paper, wooden, tin, crystal, and china weddings, namely, on the 1st, 5th, 10th, 15th, and 20th anniversaries; while silver and golden weddings are celebrated on the 25th and 50th, respectively, presents being made to the bride of the material indicated in the title.

Diana, Italian goddess, whom the Romans subsequently identified with the Greek Artemis. Diana was the protectress of slaves, who held a yearly festival in her honor. She seems to have been originally the patron divinity of the Sabines and Latins. She was a virgin, and no man was allowed to enter her temple.

The Greek Diana or Artemis was the daughter of Zeus (Jupiter) and Leto or Latona, and was the twin sister of Apollo, born in the island of Delos. While yet a child she entreated her father to suffer her to continue a virgin. She desired him, at the same time, to give her a bow and arrows, a city, and rule over the hills, 60 Oceanides, and 20 river nymphs, and to permit her to bear a torch and hunt in the forests. Zeus caused 30 cities to be devoted exclusively to her worship, and appointed many others where she was venerated in common with other deities. As Apollo directs that of the sun, Artemis guides that of the moon. Eros and Aphrodite sought to conquer her in vain. Hunting, music, and dancing alone had charms for her. She punished without mercy those of her virgins who violated their vows of chastity. Actæon, grandson of Cadmus, who secretly watched her as she was bathing, she changed into a stag, and his own dogs tore him in pieces. The beautiful Endymion, however, at length made her feel the power of love. While enlightening the earth as Selene (the moon), she beheld the hunter, fatigued with the chase, slumbering in the woods. She descended from her ethereal course, and kissed the lips of the youth, who enjoyed a favor never before granted to mortal or immortal. Notwithstanding her aversion to love, she afforded aid to women who called upon her in travail. She was also the goddess of death. She aimed her darts especially at the female sex, and brought the old, who were satiated with life, to a gentle death, to make way for the vigorous and blooming. When angry she destroyed with pestilence and disease, like her brother Apollo. When offended she revenged without compassion. Thus she slew Orion, the hunter, from jealousy, because Eos (Aurora) had fallen in love with him; so also the daughters of Niobe, because their mother preferred herself above Latona, etc. In the Trojan war both Artemis and Apollo aided the Trojans; and in the war with the giants and Titans she proved her valor.

The worship of Artemis was spread through

DIANA OF FRANCE — DIAPHRAGM

all Greece, and the various legends here related do not all refer to the same deity, it being common in ancient mythology to group together under the name of some celebrated divinity the local associations and traditions originally belonging to different mythical personages. She received many surnames, particularly from the places where her worship was established, and from the functions over which she presided. She was called Lucina, Ilithyia, or Juno Pronuba, when invoked by women in child-bed, and Trivia when worshipped in the cross-ways, where her statues were generally erected. She was supposed to be the same as the moon and Proserpine or Hecate, and from that circumstance she was called Triformis; and some of her statues represented her with three heads, that of a horse, a dog, and a boar. She was also called Agrotera, Orthia, Taurica, Delia, Cynthia, Aricia, etc. She was supposed to be the same as the Isis of the Egyptians, whose worship was introduced into Greece with that of Osiris, under the name of Apollo. The Artemisia was a festival celebrated in honor of her at Delphi. At first she was represented with a diadem, afterward with the crescent upon her head, with bow and arrows, a quiver over her shoulders, and a light hunting dress, together with her hounds. Her most famous temple was at Ephesus, and was considered one of the wonders of the world. She was worshipped there as the symbol of fruitful nature, and represented with many breasts, encircled with numerous bands.

Diana of France, Duchess of Montmorency and Angoulême, French intrigante: b. Piedmont 1538; d. 3 Jan. 1619. She was a natural daughter of Henry II.; was formally legitimized, and married first to a son of the Duke of Parma, next to the eldest son of the Constable de Montmorency. She enjoyed great influence at court under Henry IV., superintended the education of the young prince, afterward Louis XIII., and then retired from court.

Diana of Poitiers, pwā-tē-ā, Comtesse de Brézé, Duchess de Valentinois, French beauty: b. 1499; d. 1566. She was the mistress of King Henry II. of France, in whose name she ruled with unlimited power. Till his death in 1559 she exercised such an absolute empire over the king by the charms of her wit and grace, that her superstitious contemporaries ascribed her power to magic. Upon his death she retired to her castle Anet, where she established a charitable institution for the support of 12 widows. Medals are still to be seen bearing her image, trampling under foot the god of love, with the inscription, *Omniū victorem vici* (I have conquered the universal conqueror).

Diana Monkey, a monkey (*Cercopithecus diana*), native to the west coast of Africa. Its name is given because it bears on its forehead a crescent of upright white hairs, suggestive of the new moon, which was the emblem of the Greek goddess Diana. It is black in color, streaked with brown down the back; the fore parts are pure white, as also is the long beard. It is gentle and easily tamed, but is not strong enough to endure captivity and change of climate. Hence the specimens sent to menageries usually die within a short time.

Diana's Tree (*Arbor Diana*), silver tree, is formed from a solution of silver in nitric acid, precipitated by quicksilver, and crystallized in

prismatic needles which are grouped together in the form of a tree. To make this beautiful process visible, let a quantity of pure silver be dissolved in nitric acid; then dilute the saturated solution with 20 or 30 parts of water, and put in an amalgam of eight parts mercury and one part silver leaf, upon which after some days crystals are formed. The crystals consist of an amalgam of silver, or rather a definite compound of the silver and mercury. The name is formed from the supposed connection between the moon and the metal silver.

Dianthus, a genus of the pink family (*Caryophyllaceæ*). The genus has about 200 species, natives of the Old World. The name is said to be from the Greek, and to signify "Jove's flower." The American species are all naturalized from Europe, and are fugitives from cultivation. The best known are maiden pink (*D. deltoides*), which in summer is found in the region from eastern Massachusetts to Michigan, and the bunch-pink or sweet-william (*D. barbatus*), found wild occasionally in the Eastern and Middle States.

Diapason, dī-a-pā'zōn or -sōn (meaning in Greek, complete, all-pervading), a term in music by which the ancient Greeks designated the octave. The French use the term as equivalent to pitch. Diapason is also the English name given to certain fundamental stops of the organ.

Diapedesis, dī-a-pe-dē'sis, a process in which red and white blood cells pass through the walls of the capillary blood vessels. It is a constant accompaniment of inflammation, and is to be regarded as a protective mechanism on the part of the body, particularly of the white blood cells.

Diaper, a kind of textile fabric much used for towels and napkins, and formed either of linen or cotton, or a mixture of the two, upon the surface of which a figured pattern is produced by a peculiar mode of twilling. In the fine arts the term is used for a kind of surface decoration consisting of the repetition of a simple unit or units of design evenly spaced.

Diaper Ornament, in architecture, an ornamentation of flowers, applied to a plain surface, either carved or painted. If carved, the flowers are entirely sunk into the work below the general surface. They are usually square, and placed close to each other, and are various in their pattern and design. Diaper work was first introduced in the early English style in some of the principal Gothic structures in England.

Diaphoretics, or **Sudorifics**, agencies that increase the secretion of sweat. The chief diaphoretics are heat—in the form of hot packs, warm drinks, etc.—alcohol, pilocarpine, opium, salicylates, and a number of the newer synthetic products, such as antipyrine, phenacetine, antifebrine, etc. Diaphoretics are employed largely to reduce temperature, as they increase the perspiration and thus permit of a large amount of surface evaporation. They are also useful agents often in the treatment of disease of the skin, since they cause an increased amount of blood to flow to the skin and thus improve its nutrition.

Diaphragm, dī'a-frām. 1. In anatomy, a large robust, muscular membrane or skin placed transversely in the trunk, and dividing

the chest from the belly. In its natural situation the diaphragm is convex on the upper side toward the breast, and concave on its lower side toward the belly; therefore, when its fibres swell and contract, it must become plain on each side; and consequently the cavity of the breast is enlarged to give liberty to the lungs to receive air in inspiration; and the stomach and intestines are pressed for the distribution of their contents; hence the use of this muscle is very considerable. It is the principal agent in respiration, particularly in inspiration; for when it is in action the cavity of the chest is enlarged, particularly at the sides, where the lungs are chiefly situated; and as the lungs must always be contiguous to the inside of the chest and upper side of the diaphragm, the air rushes into them in order to fill up the increased space. In expiration it is relaxed and pushed up by the pressure of the abdominal muscles upon the viscera of the abdomen; and at the same time that they press it upward they pull down the ribs, by which the cavity of the chest is diminished and the air suddenly pushed out of the lungs.

There are three openings in the diaphragm, one for the passage of the inferior vena cava; one for the passage of the œsophagus and pneumogastric nerves; and the aortic, through which pass the aorta, the right vena azygos, and thoracic duct. The diaphragm also comes into play in hiccough and sobbing, laughing and crying, sometimes causing hernia, or rupture of the viscera.

2. In optics, an annular disk in a camera or telescope or other optical instrument, to exclude some of the marginal rays of a beam of light. The original form of this beautiful contrivance is the iris of the eye, which shuts out strong light and regulates the quantity admitted.

Diarbekir, dē-är'/'bē-kēr', Asiatic Turkey, city, capital of the vilayet of Diarbekir. It stands on a high bank overlooking the Tigris, and is surrounded by a lofty massive wall, built of blocks of black porous stone, the best houses being also of the same material. The principal edifices are the great mosque, a fine structure with a square tower, and originally a Christian church; and the Armenian cathedral and Chaldæan church, handsome buildings recently erected. The manufactures, once very extensive but now greatly decayed, consist chiefly of iron and copper ware, leather, silk, woolen, and cotton goods; the bazaars are well stocked with every description of goods, and a limited trade is carried on with Syria and Aleppo. Pop. about 40,000.

Diarrhœa, a symptom of a disordered condition of the intestines, accompanied by too frequent movements of the bowels, due to their increased peristaltic (or wave-like) motion. Like dyspepsia, it is only a symptom of some pathological condition. Diarrhœa is usually the result of some indiscretion in diet, such as the eating of unripe or overripe fruit, improper or indigestible foodstuffs; or of poorly cooked, decomposed, or tainted meats and fish, these inducing a kind of diarrhœa due to a toxic or poisonous bacteria known as ptomaines, and is frequently alluded to as ptomaine poisoning. While relatively more prevalent in the city than in country districts, and oftener found among

the poor than the well-to-do, it cannot be said that diarrhœa is particularly a disease of the city or of the poor, since severe and even fatal attacks of it frequently occur among the rich inhabiting the seaside or mountains.

The conditions that produce diarrhœa are varied and numerous. Exposure and sudden chilling of an overheated body, particularly of the abdomen, are potent causes; and travelers who make frequent changes of drinking water are very susceptible to it. In these cases personal idiosyncrasy plays an important role. The drinking of impure water and living in poor hygienic surroundings cause diarrhœa. Whether sewer gas or pollution of the atmosphere has direct influence is a disputed point, but it is certain that direct drainage of polluted sewage from districts infected with epidemic diarrhœa into a water supply is a potent cause.

Daily variations of temperature, such as are experienced in the hot season from May to September, are familiar predisposing factors. Environment such as is found in densely populated districts where people live in damp basements, etc., with vitiated atmosphere and want of care, is in the same category of causes.

Diarrhœa is often caused by the irritating action of mineral poisons, such as mercury, arsenic, and antimony, by overdoses of croton oil, etc., or by various cathartic nostrums. Worms of various species are likewise causative factors. Of late much attention has been given to these parasitic causes, notably that of protozoon *Amaba coli*, so frequently found in the stool of diarrhœics, principally in tropical cases. Secondary diarrhœa is a phenomenon found during an attack of some antedating disease, as ulcer of the bowel, cancerous growths of the intestines, and the inflamed and ulcerative stage of typhoid fever. In diabetes and Bright's disease it is mostly a form of eliminative diarrhœa. Nervousness, particularly in women, is an annoying cause due to a temporary local congestion of the mucous membrane of the intestine.

The symptoms of diarrhœa naturally vary with the causes, though certain symptoms are common to all forms. One of these is the frequency and character of the stools, which may vary from 5 to 20 or more in a day. At first soft, and mixed with particles of undigested food, they gradually grow more liquid until almost watery, and are attended by griping colic-like pains about the navel. Flatulence and vomiting are also prominent features, and thirst is often great, owing to loss of liquids from the body through repeated evacuations. The pulse is usually quickened, though the fever is seldom high, and is of no serious consequence. If the diarrhœa become chronic or long continued, prostration ensues, though this contingency is infrequent. Secondary diarrhœa, due to chronic congestion or pathological changes in the intestines, is much more intractable.

The treatment of diarrhœa must necessarily vary with the inciting cause, though many cases recover spontaneously or need treatment for only a few days. Absolute rest and low diet are indicated in all forms. If the attack is due to exposure or cold, the application of hot turpentine stupes to the abdomen, with the administration of small and frequent doses of opium and bismuth, may be all that is required, when, however, it is due to offending food in the intes-

tines, or to ptomaines, the prompt removal of these elements must be effected. Broken doses (one tenth gr.) of calomel every half hour, or a teaspoonful dose of Epsom salts in Vichy water, until the stools assume a more natural consistency, are prompt and efficient remedies. By far the most popular is a prepared dose of castor oil containing 10 or 15 drops of laudanum. This should be followed by astringent antiseptics, combined with opium and a digestive; for instance, sulphocarbonate of zinc or soda, opium in either powdered or extract form, with blue-mass. Should the pain be excessive, chlorodyne, or hyoscyamine, or in extreme cases small doses of morphia may be given until the patient is relieved. For the vomiting, small doses of hot water, or plain lime water will be effective, and the application of the old-time spice-plaster or hot poultice will be found soothing. Some prefer the ice-bag. Should there be any oppression, aromatic spirits of ammonia, or stimulants like brandy or whiskey, well diluted, will restore the strength, though this is seldom necessary.

The undue haste to stop diarrhoea suddenly, and the eagerness which patients exhibit to take large doses of paregoric or laudanum, or nostrums called cholera drops or diarrhoea mixtures, in all cases is mentioned only to be condemned. A more rational course is to remove the cause, thereby assisting nature to regain her normal tone and re-assert her disturbed functions.

In children and infants the same general rules should be followed, with modifications to suit each individual. In place of milk, substitute a milder form of nourishment such as egg, barley, or rice water. (See CHOLERA INFANTUM.) Another and more direct form of treatment than giving remedies by the mouth is the use of enemas, or both can be employed in conjunction. High rectal enemas are used of astringent antiseptics held in suspension in thin starch solutions, or with turpentine added.

The constipation which usually occurs after recovery from diarrhoea had better be disregarded for a day or two, when mild cathartics or laxative remedies can be used. Very effective remedies are glycerine suppositories and enemas of cold water.

WILLIAM RUOFF, M.D.,
Philadelphia.

Diary, a daily record of events or observations made by an individual. It contains a narrative, more or less detailed, of matters of personal interest, often including the results of reading or meditation. Yet references to current events of general interest are sometimes introduced. This form of diary is also known as a journal. To the mercantile man a diary serves the purpose of an order or memorandum book; while the physician finds it indispensable as a register of engagements. Books convenient for making such records are issued every year, containing besides the blank pages, various reference tables, etc. The "Ephemeris" of the ancients was originally a military record or journal, a day-book or account-book, also a collection of tables showing the position of the heavenly bodies, but passed into literature to mean a collection of records of what has happened on the same day in various years, or a mere general name for any form of periodical books or magazines.

Diaries have often furnished the historian with invaluable material, supplying the absence of public records, and furnishing minute and intimate details of manners and of motives that do far more to help us to understand the past than more formal records. Such documents as Robert Baillie's 'Journals,' the 'Diaries' of Pepys and Evelyn, and the 'Journals' of Greville are among the most valuable sources of real history.

Dias, Antonio Gonçalves, ăn-tô'nê-ô gôn-săl'vêth dê'ăs, Brazilian poet: b. Caxias 10 Aug. 1823; d. 3 Nov. 1864. He was educated in Portugal, and returning to his native country, published at Rio de Janeiro in 1846 a volume of poems entitled 'Primeiros cantos,' which was followed by his drama of 'Leonor de Mendonça' (1847); 'Segundos cantos' (1848); and 'Ultimos cantos' (1850). In 1848 he was chosen professor of national history in the college of Dom Pedro II.; he was subsequently employed in the office of the minister of foreign affairs, and in 1855 was charged with a scientific mission to Europe. His poetry has been exceedingly popular in Brazil.

Dias, Bartholomeu, bār-tô-lôm-mă'ôo, Portuguese navigator: b. about 1445; d. 29 May 1500, while on his way from Brazil to India. In 1486 he sailed on an expedition to explore the west coast of Africa, and without knowing it was carried around the southern point of the continent and landed at the mouth of Great Fish River, where he discovered that he was on the east coast. The stormy cape he called Cabo Tormentoso, a name which the king of Portugal changed into Cape of Good Hope. Dias subsequently sailed on another African expedition under Vasco da Gama, and commanded one of the vessels in the fleet with which Cabral discovered Brazil. It was on this expedition that he perished.

Dias, Henrique, ăn-rêk', Brazilian general: b. Pernambuco about 1600; d. latter part of the 17th century. He was a freed negro, who by his superior attainments rose in 1639 to the supreme command of the colored soldiery of the Brazilian army. He took a conspicuous part in the protracted warfare which finally led to the overthrow of Dutch influence.

Diaspore (Gr. "scattering"), a native hydrated oxide of aluminum, having the formula $Al_2O_3 \cdot H_2O$, and crystallizing in the orthorhombic system. It is commonly gray, creamy-white, or lilac in color, though sometimes various shades of brown and yellow, or colorless. It has a hardness of from 6.5 to 7, and a specific gravity of about 3.4. It is transparent to sub-translucent, and exhibits powerful doubly refracting properties. The best known localities in which it occurs are Chester, Mass., Newlin, Pa., in the United States, and in Europe near Schemnitz, Hungary. Many specimens decrepitate strongly when heated before the blowpipe, separating into pearly scales that are scattered in all directions; and it is from this peculiarity that the mineral derives its name.

Diastase, dî'a-stās, a substance existing in barley, oats, and other plants, and also in animals. When in solution it possesses the property of causing fecula or starch to break up at the temperature of 156° F., transforming it first

into dextrine and then into sugar. It is obtained by digesting in a mixture of three parts of water and one of alcohol, at a temperature of 113° F., a certain quantity of germinated barley ground and dried in the open air, and then putting the whole under pressure and filtering it. It is solid, white, and soluble in water and diluted alcohol, but insoluble in strong alcohol. If 200 parts of fecula be mixed with 1,000 parts of water, and a portion of diastase be added, and the mixture kept at a temperature of about 156° F., the starch is converted gradually into dextrin and grape-sugar. The action of diastase is prevented by acids, alkalis, and some salts, but not by alcohol or ether. A solution of diastase becomes acid, and loses its power on starch. The action of the diastase of germinating barley is important in brewing. The composition of diastase has not been exactly determined. It is, however, an albuminoid substance. A body having the power of converting starch into sugar exists in saliva and is known as ptyalin. It is also an albuminoid, and is probably analogous to diastase in its composition. Diastase is used in the manufacture of dextrin (q.v.), and it has also been proposed for dissolving the starch and dextrin used by printers for thickening their colors.

Diastole, dī-ās'tō-lē. In the description of circulation of the blood it was shown that Harvey first appreciated that there was a successive contraction and dilatation of the heart-muscle. The term systole has been applied to this contracted state and the term diastole to the succeeding dilatation.

Diathermancy, a term designating the property that is possessed in various degrees by different substances of transmitting radiant heat. Bodies that are equally transparent, that is, bodies which have equal power of transmitting rays of light, are very different in their power of transmitting heat rays. Thus a thin plate of glass and a thin plate of rock salt may be nearly equally transparent, but the plate of rock salt has far superior power of transmitting rays of heat. This may be shown very simply. Let a delicate thermometer be placed near to a lamp (but not above it), the mercury will rise on account of the heat radiated to it. If a plate of rock-salt be interposed between the lamp and thermometer, the mercury will fall slightly; but if a plate of glass of equal thickness with the plate of rock-salt be interposed, it will be seen that the greater part of the heat is at once cut off from the thermometer. The transparency of bodies to light does not at all necessitate their diathermancy. Thus clear rock-crystal, which is transparent, and smoky rock-crystal, which is opaque, are nearly equally diathermanous; and solution of iodine in bisulphide of carbon, which is perfectly opaque to light, is highly diathermanous. The diathermancy of plates of various thickness has also been determined. The diathermancy decreases very rapidly as the thickness increases. Consult: Stewart, 'Treatise on Heat'; Deschanel, 'Elementary Treatise on Natural Philosophy.' See also RADIATION; THERMO-ELECTRICITY.

Diathesis, dī-āth'ē sīs. There is in all organic life a certain predisposition for the constituents of the cells to behave in a certain predetermined manner, and in medicine this term

comes to mean the predisposition or constitution of a body by virtue of which certain of its tissues or organs become at one time or another the seat of affections similar in their nature. Thus there exists in certain families a tendency to the development of certain constitutional diseases, such as gout, rheumatism, tuberculosis, etc. In others there may be a predisposition to nervous instability. In others there are conditions which bring about ready disturbance of the digestive powers. In most of these instances there seems to be a point when the store of vitality in the tissues of an organ becomes exhausted earlier than in other predisposed individuals, so that diathesis may be described in other words as a premature localized breakdown.

Diatomaceæ. See DIATOMS.

Diatoms, dī'a-tōmz, a sub-order of microscopic plants belonging to the class *Algæ*. A plant of this sub-order consists of a unilocular or a septate cell; and its cells are composed of two symmetrical valves, multiplying by spontaneous separation. There are two well-defined sections: (1) *Diatomeæ*, including species invested with a silicious epidermal covering, occurring both in fresh and salt water, often exhibiting exquisite sculpturings when seen under the microscope, and testing the highest powers of the instrument; (2) *Desmidiæ*, minute fresh-water plants of a green color, without a silicious covering. There are more than 4,000 distinct species scattered over all parts of the world. The walls of the cells are rendered hard by silica and they are reproduced by fission, the splitting taking place parallel to the longer axis. When the protoplasm escapes the cell walls retain their shapes and delicate markings. Enormous quantities of them are found as fossils in the beds of the Tertiary formation. Often the protoplasm of two diatoms will escape and unite to form a zygospore, which after a time will divide into two, each forming a new cell larger than before. Some diatoms are free and move rapidly through the water; others secrete a mucilaginous substance whereby they attach themselves to various objects. In some cases the diatoms, after splitting, remain attached to one another, forming bands or ribbons. They are classified, according to the structure of the cell walls, three main families being recognized, according as they have on the principal face of the wall a distinct ridge (*Raphidiæ*), an indistinct or false ridge (*Pseudoraphidiæ*), or no ridge at all (*Araphidiæ* or *Cryptoraphidiæ*).

The diatoms possessing a silicious epidermis have been eagerly studied of late years by microscopical observers, who have greatly increased the number of genera and species. They are universally distributed, and their silicious coverings being indestructible, their remains are accumulated and perpetuated in many localities, sometimes forming extensive deposits, as of Richmond, Va., which is said to be built upon a stratum of these microscopically minute atoms 18 feet in thickness. Species of *Arachnoidiscus* and other genera of great beauty are obtained from guano. The bergmehl or mountain-meal of Sweden consists of diatoms. The mud at the mouths of many rivers, the sediment of ponds, ditches, and even rain-troughs, contain myriads of the same minute organisms. They were found by the Arctic navigators investing the

DIATONIC — DIAZ DEL CASTILLO

fields of polar ice; and they have also been detected in the dust evolved from volcanoes.

Diaton'ic, a term used in the science of music, originally from the Greek, meaning "through the tones." The diatonic mode of the ancient Greeks—as distinguished from their chromatic and enharmonic mode—formed the foundation of their whole system of music, and was arranged in three tetra chords composed of one semitone and two whole notes. In modern music the term is applied to compositions which follow the tones, intervals, or harmonies of the standard major or minor scales, without chromatic alteration.

Diatribē, di'a-trīb (Greek, *diatribé*), a dwelling or lingering upon, originally signified a sustained discourse or disputation, afterward came to be applied to a violent and sweeping criticism, whether written or spoken.

Diaz, di'áz, Abby Morton, American writer: b. Plymouth, Mass., 1821; d. Belmont, Mass., 1 April 1904. She was a member of the famous Brook Farm Association, and has been an earnest worker in social reforms. She founded the Woman's Educational and Industrial Union of Boston, and was its president for many years. Her books for children include: 'The Cat's Arabian Nights' (1881); 'The John Spicer Lectures' (1887); 'Polly Cologne'; 'Jimmyjohns'; and 'The William Henry Letters' (1870). Other works are: 'Bybury to Beacon Street, a Discussion of Social Topics'; 'Domestic Problems'; 'Only a Flock of Women' (1893).

Diaz, Miguel, mē-gēl' dē āth, Spanish explorer: b. Aragon second half of the 15th century; d. 1514. He took part in the second voyage of Columbus, and was one of the colonists of the island of St. Domingo. He quitted the colony in 1495 in consequence of a duel, and took refuge with a few of his companions in the southern part of the island, where he married a native. Through the advice of his wife he discovered the gold mines in this part of the island, the existence of which he communicated to Bartolomé Columbus, whereby he reconciled himself with the colonists, and led the way to the foundation of the town of Nueva Isabella, afterward called St. Domingo. He was made governor of Porto Rico in 1509, but his fidelity to the family of Columbus repeatedly brought him into trouble.

Diaz, Porfirio, pōr-fē'rē-ō dē'ās or dē'āth, Mexican statesman: b. Oaxaca 15 Sept. 1830. He received a classical education at the Oaxaca Institute, and had begun studying law when the war with the United States broke out. He served through that struggle in the National Guard, and on the conclusion of peace made a study of military science. On Santa Anna's accession to the dictatorship, he left the army and practised law; but returned and bore a conspicuous part in the revolution of 1854; took the field to oppose the French troops and was taken prisoner, but made his escape; harassed Maximilian's troops till forced to surrender a second time at Oaxaca in 1865; besieged and captured Puebla in 1867, and immediately marched on Mexico City, which surrendered to him 21 June. On the re-establishment of the republic he was an unsuccessful candidate for president. In 1872 and 1876 he led revolutions

against the government, and after three severe battles occupied the capital in the latter year. In 1877 he was elected president to fill the unexpired term of the fugitive president, Lerdo. According to the "plan of Tuxtepec," which he had proclaimed, he was ineligible to succeed himself. His secretary, Gen. Gonzales, was elected president, and Gen. Diaz was appointed chief-justice of the supreme court, and elected governor of Oaxaca. In 1884 he was re-elected president; in 1886 his partisans secured the abolition of the law prohibiting a second consecutive presidential term, and he has been thereafter continuously re-elected, his sixth term expiring 30 Nov. 1904. To Diaz Mexico is indebted for her rise, progress and standing as a nation. He has made property secure by preserving a stable government, and deserves the confidence of his people.

Diaz, Ruy, roo'ē dē'āth, Spanish soldier: b. Seville, Spain, 1503; d. Peru 1538. He went to Peru in 1532 with the expedition of Diego de Almagro, and took part in the conquest of Cuzco; then joined Velalcazar in the conquest of the province of Quito. He was sent by Pizarro to explore the valley of the Rimac, and it was in accordance with his report that the site was chosen for the city of Los Reyes (now Lima), and the city founded. When war broke out between Almagro and Pizarro, Diaz sustained Almagro, was in the battle of Abancay 1537, and other important engagements, and was captured at the battle of Salinas 1538, and put to death.

Diaz del Castillo, Bernardo (vulgarly **Bernal**), one of the Spanish conquerors of Mexico, and historian of that conquest: b. Medina del Campo, in Old Castile, about 1498; d. Santiago de los Caballeros, Guatemala, leaving numerous descendants. His work, entitled 'Historia Verdadera de la Conquista de la Nueva España,' is of uncommon value and interest. Date of his death not known. Probably his family belonged to the minor nobility: he says, when speaking of the conquerors, "We were for the most part hidalgos, although some were not of such clear lineage as others"; but he lacked the influence necessary to secure his appointment as an officer. He speaks of himself as "having been in this country (Central America and Mexico) twice before the coming of Cortés, and the third time with him." On the first occasion he accompanied Pedrarias Davila (q.v.); on the second, he took part in the expeditions to Yucatan and along the coast of Mexico under Córdoba and Grijalva (1517-18). Between 1515 and 1517 he visited Cuba; from Santiago de Cuba, on 18 Nov. 1518, he sailed with the Spanish fleet under Cortés; during the next few years he fought, it is said, in more than 100 of the battles with the Indians preceding or following the capture of the City of Mexico; and in 1523-4 he served under Pedro de Alvarado, conqueror of Guatemala and Salvador. Alvarado established the seat of government in the native (Guatemalan) town of Almolonga, afterward called Santiago de los Caballeros; and Bernal Diaz was made governor of this town, as a reward for his service in the field. He writes naively: "I was held in no inconsiderable degree of estimation in my day as a soldier"; and again, "I was twice in the hands of the enemy who were carrying me off to sacrifice, but God gave me strength to

GENERAL PORFIRIO DIAZ,
President of Mexico.

escape out of their clutches." In 1550 he was summoned to an important council at Valladolid, "as being the most ancient of the conquerors of New Spain." His history was finished 26 Feb. 1568. Two licentiates who examined the work at that time, "observed that in regard to my style or language it was conformable to that in ordinary use in Old Castile, and that as such it was the more agreeable, not being embarrassed with flowering, affected phrases." The particular merit of the history is that it gives to each of the officers and soldiers the credit which was his due, instead of ascribing the overthrow of the Aztec empire and the establishment of New Spain solely to the genius of Cortés. "The historians Gomara and Illescas," Diaz writes, "never chose to relate our heroic actions, leaving all our value and honors in the dark, where they would have remained were it not for this my true history, and assigning such great merit to Cortés. Although they were right to a certain degree (in praising our leader), yet they should not have forgotten us." So desirous is he to make known the exact truth, that at the end of his manuscript he writes, "I beg the printers (señores impresores) for mercy's sake not to omit anything from or add anything to the foregoing."

MARRION WILCOX.

Diaz de Escobar, Narciso, nār-thē'sō dē āth dā ēs'kō-bār, Spanish poet: b. Malaga 25 June 1860. He won great popularity with his lyric poems, and several of his dramatic compositions have been very successful. 'A Morisco Episode'; 'The Young Men of the Day'; 'Two Husbands and a Wife.' In collaboration with other writers he has published a volume of 'Character Sketches from Madrid.'

Diaz de la Peña, dē'āth dā lā pē'ñā, Narcisse Virgile, French painter b. Bordeaux 20 Aug. 1807; d. Mentone, France, 18 Nov. 1876. He was of Spanish parentage, and at the age of 15 was apprenticed to a porcelain painter, but ambitious of working in oils about 1831 began to exhibit in the Salon. He in time won fame by his landscapes, which he peopled with nymphs, loves, and satyrs. These figures are badly drawn, but as a colorist Diaz ranks highly among the painters of the romantic school in France, and to color he was content frankly to sacrifice form. He was also an exquisite painter of flower-pieces.

Diaz de Pineda, Gonzalo, gōn-thā'lō dē-āth dā pē-ñā'dā, Spanish soldier: b. Torrelavega about 1500; d. Peru 1545. He went to Peru with Francisco Pizarro in 1531; explored the river Magdalena in 1535; and in 1539 became governor of the province of Quito. In 1540 he joined the expedition of Gonzalo Pizarro for the conquest of the Canelos and the exploration of the country east of the Andes. He was sent in search of the party of Orellana, who had gone ahead to seek for supplies. In the course of the search, which was unsuccessful, Diaz explored a large part of the course of the Amazon, but returned to the main expedition, which by his aid succeeded in returning to Peru, though with heavy losses. When Gonzalo Pizarro revolted against the viceroy, Nuñez, Diaz at first offered his services to the viceroy, but later joined Pizarro. He was surprised and defeated by Nuñez, but escaped capture.

Diaz de Solis, Juan. See SOLIS, JUAN DIAZ DE.

Dib'din, Charles, English lyric and dramatic poet and actor: b. Southampton March 1745; d. London 25 July 1814. He opened a little playhouse in London, the Sans Souci Theatre, and there brought out his own plays, enlivened with his own songs, set to music of his own composition, and with himself as the leading actor. He wrote probably 50 plays and operettas (best remembered among them 'The Quaker,' an operetta), two novels, a 'History of the Stage,' and over a thousand songs. His 'Sea Songs,' such as 'Tom Bowling,' and 'The Flowing Can,' are popular favorites still. He wrote an autobiography: 'Professional Life' (1803).

Dibdin, John Thomas, English song writer and dramatist: b. London 21 March 1771; d. there 16 Sept. 1841. He was the second son of Charles Dibdin (q.v.), and in 1775, when only in his fourth year, was brought upon the stage as the Cupid of Shakespeare's 'Jubilee,' while Mrs. Siddons personated Venus. After being connected with various theatres, and writing great numbers of songs, he returned to London in 1795, wrote a number of dramas with great success for the minor theatres, and obtained an engagement at Covent Garden, with which he continued connected for 14 years. Among his numerous pieces the best known are: 'Mother Goose,' by which the theatres are said to have netted a profit of \$100,000; the 'High-mettled Racer,' which was almost equally profitable; 'The Cabinet'; 'The Jew and the Doctor'; and 'Past 10 O'clock,' which long held the stage. He wrote a 'Metrical History of England' (1813); and 'Reminiscences' (1827).

Dibdin, Thomas Frognal, English bibliographer, son of the elder brother of Charles Dibdin (q.v.), the celebrated naval song writer: b. Calcutta 1776; d. Kensington 18 Nov. 1847. He became a popular preacher in London, and was well known there as a bibliomaniac. He proposed a club to dine together in honor of bibliography, which was established in 1812, under the name of the Roxburghe Club. This club adopted a rule that each member should every year reprint a book for presentation to all the members. Of his numerous writings those connected with bibliography are alone of any value. Among them may be noted: 'Bibliomania' (1809); 'Bibliographical Decameron' (1817); 'Typographical Antiquities of Great Britain' (1810-19).

Dibranchiata, dī-brān-kī-ā'tā, an order of cephalopods (see CEPHALOPODA), characterized by the possession of two gills only, and by the fact that the shell, if external, as is rarely the case, is never chambered. It includes the cuttlefishes, squids, and paper nautilus, as well as the extinct family of *Belemnitidae*. The order contains two sections, *Octopoda* and *Decapoda*.

Dibutades, dī-bū'ta-dēz, Greek sculptor or potter of Sicyon: lived about 600 B.C. Although he is the reputed originator of work in relief, the only historical basis for his fame is a Corinthian work, bearing his name, supposed to date from before 600 B.C.

DICE—DICHROIC CRYSTALS

Dice (plural of *Die*), small cubes of bone, or ivory, on each of the six sides of which a number, ranging from one to six, is marked permanently. The sum of the two numbers on the opposite sides of a die is always seven; thus if six is at the top one is at the bottom, and so on. One, two, three, or five dice are used, according to the game to be played. It, or they, are placed in a cylindrical box about four inches high, and from one and a half to two inches in diameter, open at the top. The box is shaken and turned quickly up so that the dice will fall flat on the table. The aggregate amount of the spots uppermost at each throw are summed up and placed to the score of the thrower. The purposes to which the throwing of dice is put are endless, besides the many games in which they are used in a variety of ways. The principal games are "throwing the dice," "round the spot," "centennial," "multiplication," "going to Boston," "draw poker," and "vingt-un," all of which will be found described in detail with the rules of each game in A. Howard Cady's 'Dice' (1895).

There is no period of history, and no nation, in which some form of dice has not been used. They are depicted on the early Egyptian monuments; those excavated at Thebes can scarcely be distinguished from the dice made to-day, and their use is attested by laws regulating the games played with them in ancient Greece and Rome, as well as in most European countries.

The invention of dice is attributed to Palamedes (circa 1,244 B.C.). But the use of cubes with numbered sides for gambling purposes is probably much earlier.

The Latin word for dice, *tessera*, is derived from the Greek *tesseres*, Ionic for *tessares*, four, because it is on every side square. Numerous passages in the ancient writers, and very many representations in marble or paintings, show how frequent dice-playing was among them. Different from the *tessera*, which were precisely like our dice, were the *tali* (which means, originally, the pastern bone of an animal—Greek, *astragalos*). These were almost of a cubic form, and had numbers only on four sides, lengthwise. Three *tessera* and four *tali* were often used together, and the game with dice was properly called *alea*, though *alea* afterward came to signify any game at hazard, and *aleator* a gambler.

Dicentra, di-sen'tra, a genus of plants of the poppy family (*Papaveraceæ*), now generally known as *Bicuculla*, original spelling *Bikukulla*, Greek for double-hooded. The genus numbers about 15 species, natives of North America and western Asia. The best-known American species are the Dutchman's Breeches (*B. cucullaria*), and bleeding-heart (*B. eximia*). The common squirrel-corn (*B. canadensis*), is also a member of the genus. The Dutchman's Breeches grows in woods from Nova Scotia to Lake Huron, Mich., and Washington, south to North Carolina and Missouri. Bleeding-heart is found in rocky places from the western part of New York, south to Georgia and Tennessee, along the mountain ranges.

Diceratherium, an extinct genus of rhinoceroses which inhabited North America during the Oligocene Epoch, distinguished by a pair of horns one above each eye, instead of on the middle line of the head.

Dicey, Edward, English journalist and author: b. Leicestershire, England, 1832. He was graduated at Trinity College, Cambridge, and was from 1870 to 1889 editor of the 'Observer.' He has published: 'Rome in 1860' (1861); 'Cavour: a Memoir' (1861); 'Six Months in the Federal States' (1863); 'The Schleswig-Holstein War' (1864); 'The Battle-fields of 1866' (1866); 'A Month in Russia During the Marriage of the Czarewicz' (1867); 'The Morning Land' (1870); 'Victor Emmanuel' (1882); 'England and Egypt' (1884); 'Bulgaria, the Peasant State' (1895); 'The Story of the Khedivate' (1902).

Dichotomous (Gr. "divided into two equal parts"), a term specifically used in botanical description to designate any appearance of branching by forking. Thus the stems of some phanerogams—for example, mistletoe, doum-palm, and many inflorescences—for example, *Caryophyllæa*, begonias—appear forked, while an ordinary fern-frond has no such appearance. The progress of morphological research has, however, shown that true dichotomy—for example, complete division of the growing point into two lateral apices, is really as characteristic of development of the fern-frond as of such obviously dichotomous vegetation as that of *Selaginella*; while conversely the appearance of forking in phanerogams comes about simply by the suppression of the growing point, and the development of two new axes from opposite lateral buds. Outside the cryptogams, indeed, no case of true dichotomy has been described, with the doubtful exception of the roots of cycads. See CRYPTOGRAMIA; CYCADS; FERNS.

Dichotomy in logic, a distribution or separation of ideas by pairs; the division of a class into two sub-classes opposed to each other by contradiction, binary classification as revived by Ramus against the Aristotelians; the Platonic doctrine that all classification should be by dichotomy. Since Kant this opinion has found scant favor.

In botany, a term applied to that kind of branching by a constant furcation or division into two parts, as where the stem of a plant branches into two branchlets, each of which in its turn divides into others, and so on. Example, the mistletoe. The veins of various ferns thus branch dichotomously.

In astronomy, that phase of the moon where it appears bisected or is only half illuminated, as at the quadratures.

Dichroic Crystals, so called from their property of exhibiting two colors when polarized light is passed through them in different directions. Thus dichroite, a mineral described below, appears deep-blue in the direction of the principal axis, and yellowish-brown in a direction at right angles to it, even when viewed with ordinary light. Brewster gives a list in his 'Optics' of over 30 crystals which exhibit this property with the aid of a polariscope. The name trichroic is applied to crystals which exhibit three colors when viewed in three directions.

Dichroic Crystals, those which exhibit dichroism (q.v.).

Dichroism (Greek, *dis*, "twice," *chroa*, "color"), the property which many colored doubly refracting crystals have of exhibiting

different colors in different directions. Thus the color of a green tourmaline appears very much darker in the direction of the vertical axis than when the crystal is viewed at right angles to that axis. As in many instances three colors are exhibited, the term "pleochroism" (Greek *pleon*, "more"; *chroa*, "color"), being of a more general character, is often used. A crystal of iolite (dichroite) appears blue in the direction of the vertical axis, yellowish-white in the direction of the macro-axis and bluish white in the direction of the brachy-axis. Dichroism is best detected by the instrument known as the dichroscope. This consists of a rhomb of Iceland spar with wedges of glass cemented at each end of it. These are enclosed in a metal cylinder with a lens at one end and a square opening at the other. If a section of a dichroic crystal is placed in front of the orifice and is viewed through the instrument, two colored squares are seen side by side, one corresponding to the ordinary ray, the other to the extraordinary ray. Dichroism may also be observed by means of the polarizing microscope, by removing one of the nicols and revolving the stage. This furnishes a method of determining in rock sections biotite, tourmaline, epidote and hornblende, all of which are dichroic. Thus hornblende is easily distinguished from augite, which is not dichroic. Optically uniaxial crystals, or those belonging to the tetragonal and hexagonal systems, are dichroic; optically biaxial crystals, or those belonging to the orthorhombic, monoclinic and triclinic systems, are trichroic. Isotropic bodies, including isometric crystals and also amorphous substances such as opal and glass, transmit the same color in any direction. Dichroism, or the allied term "Dichromatism," has also been applied to those fluids which appear of different colors when viewed by reflected and refracted light; when seen in thick or thin layers, etc. For example, venous blood, or any blood impregnated with carbonic acid, hydrogen, or nitrogen, appears, when seen in moderately thin layers, to be of a purple color; while in extremely thin layers it appears green. This property of marked color-variation is due to the difference in the absorption of the light-vibrations in different directions. The property of dichroism is a great aid to the jeweler in distinguishing gems. Diamonds, spinels and garnets show no dichroism; sapphire, ruby, emerald, beryl, tourmaline, topaz and chrysoberyl all have characteristic dichroism.

Dick, James, Scottish merchant: b. Forbes, Morayshire, November 1743; d. 24 May 1828. He left over \$565,000 to promote higher learning among the parish schoolmasters of the shires of Elgin, Banff, and Aberdeen. The annual value of the bequest exceeds \$20,000, allowing a payment of about \$150 to each teacher participating.

Dickcissel, dīk-sīs'sēl, or **Black-throated Bunting** (*Spiza americana*), a species of finch in which the male is easily distinguished by a conspicuous jet-black throat-patch on a light yellowish background; the upper parts in both sexes are grayish brown variously streaked above with both lighter and darker shades. During the nesting season the black-throated bunting inhabits cultivated fields of the eastern United States, especially southerly. It winters in South America. The song is a very simple

unmusical ditty, and the nest is built on or very near to the ground.

Dickens, Charles, English novelist: b. Landport, Portsmouth, 7 Feb. 1812; d. Gadshill, near Rochester, England, 9 June 1870. His earliest years were passed chiefly at Chatham and in London, where his father, a very careless and improvident man, spent some time along with his household in a debtors' prison. Charles about this period, and while still a mere boy, was a drudge in a blacking warehouse. He got but little education, but about 1826 became an attorney's clerk, and while in this position studied shorthand and other subjects, and finally was able to exchange his occupation for that of a newspaper reporter and critic. In 1835 he was engaged on the *Morning Chronicle*, then one of the leading daily papers of the metropolis. On 9 June 1835 appeared the first of the series of 'Sketches of Life and Character by Boz,' which were published in the evening edition of that paper, under the title of 'Thoughts About People, by Boz.'

The 'Sketches by Boz, Illustrative of Everyday Life and Every-day People' were published in 1836, with illustrations by George Cruikshank. From this publication may be dated the origin of Dickens' fame. Chapman and Hall engaged him to prepare the letterpress for a series of comic sketches on sporting subjects, the outcome of which was the immortal 'Pickwick Papers' (1837). Great characteristics of Dickens' genius were now fully apparent, and his fame rose at once to the highest point.

The next important literary engagement of Dickens was with Bentley's 'Magazine,' which he edited for two and a half years under the pseudonym of Boz. In these volumes appeared 'Oliver Twist' (1839). Before the completion of 'Oliver Twist,' 'Nicholas Nickleby' was begun, and like Pickwick was published in monthly shilling parts. It was issued complete in 1839. Accompanying it, besides the usual illustrations, is a portrait by Maclise, in which the author is represented as "a somewhat dandified young man in a high velvet-collared coat."

'Master Humphrey's Clock,' issued in weekly numbers, contained among other matter two other leading tales, 'The Old Curiosity Shop,' and 'Barnaby Rudge,' the latter a historical tale, going back to the time of the Gordon riots. Both were published separately in 1841. The same year he visited America for the first time. Here many aspects of society struck him in a curious light, and on his return he wrote 'American Notes for General Circulation' (1842). His next novel, 'Martin Chuzzlewit' (1844), dwelt again on his American experiences.

The series of 'Christmas Tales' excited a new sensation of wonder and delight. These tales were: 'A Christmas Carol' (1843); 'The Chimes' (1844); 'The Cricket on the Hearth' (1845); 'The Battle of Life' (1846); 'The Haunted Man and the Ghost's Bargain' (1847). In 1845 Dickens went to Italy, and paid a visit to Rome, and on 1 Jan. 1846 in the first number of the *Daily News* appeared the first chapter of his 'Pictures from Italy.' Immediately after this followed 'Dealings with the Firm of Dombey and Son, Wholesale, Retail, and for Exportation' (1848); and 'David Copperfield' (1849-50). In 1850 Dickens commenced to edit the weekly serial, 'Household Words,' in

which various original contributions from his own pen appeared. Later works were: 'Bleak House'; 'A Child's History of England' (1852-4); 'Hard Times' (1854); and 'Little Dorrit,' commenced in 1857. In 1859 'All the Year Round' superseded 'Household Words'; and in the first number of this periodical, 28 May, was begun 'A Tale of Two Cities.' 'Great Expectations' followed in the same paper (1860). In 'All the Year Round' also appeared a series of disconnected sketches, called 'The Uncommercial Traveller' (1868). 'Our Mutual Friend' (1865) was the last great serial work which Dickens lived to finish.

The first number of Dickens' last work, 'The Mystery of Edwin Drood,' was issued on 1 April 1870, and only three numbers had appeared at the time of his death. Three other numbers were published from the MSS. he had left, but the story remained unfinished.

Dickens married in 1838 the daughter of George Hogarth, a musical writer and critic. In the same year he openly avowed the authorship of *Pickwick*. He had a decided taste for theatricals, and was a successful amateur performer. He frequently turned his talent in this way, and as a public speaker, to charitable purposes. He was also an admirable reader, and during the last 15 years of his life made frequent reading tours in which he gave semi-dramatic readings from his own works to appreciative audiences. He visited the United States a second time in 1867-8 on a reading tour. The enthusiastic reception he met with caused him somewhat to modify the severe opinions he had expressed in his 'American Notes,' and a sort of apologetic note was prefixed to the next edition of them, with the desire expressed that it should accompany all future editions. He was buried in Westminster Abbey. See Forster, 'Life of Dickens' (1872-4); Fitzgerald, 'The History of *Pickwick*' (1891); Kitton, 'The Novels of Charles Dickens' (1897); and 'The Minor Writings of Charles Dickens' (1900); Gissing, 'Charles Dickens: a Critical Study' (1898). In 1880-2 his eldest daughter edited his letters.

Dickens, Charles, English editor: b. 1837; d. Kensington, England, 20 July 1896. He was the eldest son of the preceding; was educated at King's College, Eton, and at Leipzig; became assistant to his father as editor of 'All the Year Round,' and subsequently chief partner in a printing firm. He edited a 'Life of Charles Mathews'; 'The Dictionary of London'; 'Paris and the Thames'; and a complete edition of his father's works.

Dickens, Mary Angela Evans, English novelist: b. 1838. In 1861 she married the eldest son of Charles Dickens. Her best-known novel is 'A Mere Cipher' (1893). She has also written: 'Cross Currents' (1892); 'Valiant Ignorance' (1894); 'Some Women's Ways,' a volume of short stories; 'Prisoners of Silence' (1895); 'Against the Tide' (1897); 'On the Edge of a Precipice' (1899); 'The Wastrel' (1901).

Dickerman, Lysander, American Egyptologist: b. Bridgewater, Mass., 1830; d. Boston, Mass., 13 Dec. 1902. He was educated at Brown University and Andover Theological Seminary, and entered the Congregational ministry in 1858. He held various pastorates in

New England, Illinois, and California, and in his later years devoted much attention to Egyptology, publishing: 'The Egyptian Deities' (1885); 'The Hittites of the Bible' (1889); 'The Fayam' (1892); 'Mariette Bey's Monument of Upper Egypt' (1900).

Dickey, Charles Andrews, American Presbyterian clergyman: b. Wheeling, W. Va., 25 Dec. 1838. He was educated at Washington College, Pennsylvania; studied at the United Presbyterian Theological Seminary 1858-61; and was pastor of the United Presbyterian Church, Allegheny City, Pa., 1861-9; the First Presbyterian Church, St. Louis, 1869-75; Calvary Presbyterian Church, Philadelphia, 1875-93; and has been pastor of the Bethany Presbyterian Church, Philadelphia, from 1893. He was moderator of the Presbyterian General Assembly 1900-1, and during his pastorate in Philadelphia was prominently associated with all the benevolent operations of his Church.

Dickie, George William, American engineer: b. Arbroath, Scotland, 17 July 1844. He studied engineering in his father's shipyard, and with the North British Railway Company, and came to the United States in 1869. He was engaged in steamship work on the Pacific coast, designed machinery for the Comstock mines, became president of the Union Iron Works in 1883, giving especial attention to naval work. He has written: 'Pumping and Hoisting Works' (1876).

Dickins, John, American Methodist clergyman: b. London, England, 24 Aug. 1747; d. Philadelphia, Pa., 27 Sept. 1798. He was educated at Eton and emigrated to America prior to the American Revolution. Becoming a Methodist in 1774, he entered the ministry, becoming one of the most notable preachers of his day. He was instrumental in founding Cokesbury College, Maryland, and the Methodist Book Concern.

Dickinson, Anna Elizabeth, American orator, novelist, and playwright: b. Philadelphia 28 Oct. 1842. At the outbreak of the Civil War she became known as a speaker, and under the stimulus of the great events became an orator of great power and persuasiveness, who created by her youth, real pathos, and brilliant rhetoric the greatest enthusiasm wherever she was heard. She was called the 'Joan of Arc' of the War. Some of her books are: 'What Answer' (1868), a novel; 'A Paying Investment' (1876); 'A Ragged Register of People, Places, and Opinions' (1879). She was the author of two plays of excellent dramatic quality: 'Anne Boleyn,' and 'Marie Tudor' (1875), in which she played the title roles.

Dickinson, Charles Monroe, American author: b. Lowville, N. Y., 15 Nov. 1842. He was admitted to the bar in 1865, and practised law until 1877 in Binghamton and New York; in 1896 he was elected presidential elector, and has been United States consul-general to Turkey from 1897. He has published a book of poems entitled 'The Children and Other Verses' (1889), the title poem of which has received remarkable popularity; and a 'History of the Dickinson Family' (1885).

Dickinson, Daniel Stevens, American lawyer: b. Goshen, Conn., 11 Sept. 1800; d. New York 12 April 1866. He was admitted to the

DICKINSON — DICOTYLEDON

New York bar, where he soon became prominent; was elected to the State Senate in 1836, and became a leader in the Democratic party, which made him lieutenant-governor in 1842, and in 1844 sent him to the United States Senate. There he became known for his pro-slavery and States-rights proclivities, and was made chairman of the Finance Committee. He was brought forward as a candidate for the presidency in 1852, but without success. He spent the later part of his life at Binghamton, N. Y., in the practice of his profession.

Dickinson, Donald McDonald, American lawyer: b. Port Ontario, N. Y., 17 Jan. 1846. He was graduated at the law department of the University of Michigan in 1866, and began the practice of law in Detroit, where he rapidly rose to a foremost position at the bar; and later practised in Washington, D. C. He was conspicuous in politics as a Democrat; was secretary of the Democratic State Central Committee, which managed the Greeley campaign in 1872; withdrew from the Democratic party, but was won back by Mr. Tilden; and was chairman of the Democratic National Committee in 1876; and a member of the committee in 1884-5. He was postmaster-general of the United States in 1887-9; chairman of the Democratic National Campaign Committee in 1892; and senior counsel for the United States before the Joint High Commission on the Bering Sea claims, under the Fur Seal Arbitration in 1896-7.

Dickinson, Emily, American poet: b. Amherst, Mass., 10 Dec. 1830; d. there 15 May 1886. Living the life of a recluse, she wrote much verse in forms peculiar to herself, but she published almost nothing; although the few pieces that appeared attracted much attention. In 1890 a collection of her poems was issued which received warm praise from competent critics; another in 1892; and her 'Letters' in 1894.

Dickinson, John, American political writer and statesman: b. Maryland 13 Nov. 1732; d. Wilmington, Del., 14 Feb. 1808. He wrote a series of state papers: 'Address to the Inhabitants of Quebec'; 'Petitions to the King'; 'Address to the Armies,' that had great influence in their day. He was the author of 'Letters from a Pennsylvania Farmer to the Inhabitants of the Colonies' (1767); and 'Essay on Constitutional Power of Great Britain over the American Colonies' (1774). Dickinson College at Carlisle, Pa., was named in his honor.

Dickinson, Jonathan, American Presbyterian clergyman: b. Hatfield, Mass., 22 April 1688; d. Elizabethtown, N. J., 17 Oct. 1747. He was graduated at Yale College in 1706, and soon afterward was installed as pastor of the Presbyterian congregation in Elizabethtown, N. J., which relationship continued until his death. After the separation of the New Jersey churches from the synod of Philadelphia in 1741, it was determined to establish a collegiate institution in the former colony, and a charter for the College of New Jersey (now Princeton University) was obtained. The first classes were opened in Elizabethtown, and Dickinson was elected president.

Dickinson, Martha Gilbert, American poet: b. Amherst, Mass. She is a niece of Emily Dickinson (q.v.), and was married to

Alexander E. Bianchi 24 July 1903. She has published: 'Within the Hedge'; 'The Cathedral and Other Poems.'

Dickinson, Mary Lowe, American educator and author: b. Fitchburg, Mass., 1839. She was married to John B. Dickinson, a New York banker, and after his death taught in schools in Boston, Hartford, and New York, being for some time principal of the Van Norman Institute in the last-named city. She edited the 'Silver Cross' magazine for 10 years, and is now the editor of 'Lend a Hand.' She has published several volumes of fiction and a collection of poems.

Dickinson College, a coeducational institution in Carlisle, Pa., founded in 1783, under the auspices of the Presbyterian Church. The government of the school was changed somewhat in 1833, and it came under the charge of the Methodist Episcopal Church. In 1902 the number of students enrolled was about 490, and the number of volumes in the library was 35,000.

Dickson, Frank, English artist: b. near Chester, England, 1861. He was educated at Liverpool College, and studied art in the Royal Academy Schools. He has exhibited often in the Royal Academy as well as in many English galleries, and in Australia.

Dickson, Samuel Henry, American physician: b. Charleston, S. C., 20 Sept. 1798; d. Philadelphia 31 March 1872. He was graduated at Yale College in 1814, and immediately after commenced the study of medicine in his native city. He was instrumental in the establishment of a medical college in Charleston, and on its organization in 1824 he was called to the chair of institutes and practice of medicine. In 1858 he was called to the chair of practice of medicine in the Jefferson Medical College, Philadelphia, which he held till his death. He was author of 'Manual of Pathology and Practice of Medicine'; 'Elements of Medicine' (1835); 'Essays on Pathology and Therapeutics' (1845); 'Essays on Life, Sleep, Pain, etc.' (1852). It is a fact worthy of note that he delivered the first temperance address ever heard south of Mason and Dixon's line.

Diclinous, dik'lī-nūs or dī-klī'nūs, a Linnaean term for flowers possessing stamens or pistils only—*Monacia*, *Diacia*, and *Polygamia*.

Dicotyledon, dī-kōt ī-lē'dōn, a plant having two cotyledons or seed-leaves, that is, primordial leaves, contained in the embryo. The majority of flowering plants have this structure. When therefore seed is sown, in most cases the future plant first appears above the ground as a tiny two-leaved existence, and in certain cases the next pair of leaves which appear, and all the future ones, are of a different structure from the first. The primordial pair of leaves are the two cotyledons. Their use in the economy of nature is to shelter the ordinary leaves situated inside. In the plural the highest class of the vegetable kingdom, containing orders of plants with the structure of seed just described. It is a natural division and has other characteristics than that now mentioned; specially, new wood is added to the old externally, whence these plants are very often termed exogens. The dicotyledons comprise at least two thirds of all known plants.

DICROTIC—DICTATORSHIPS IN LATIN-AMERICA

Dicrotic Wave, a double beating, as in the human pulse. Each pulse-wave begins with an ascent corresponding to the systole of the heart. This ascent usually forms, as registered by the sphygmograph, an unbroken line until the apex of the curve is reached and the descent commences. The descending curve is marked by several minor waves, one of which being quite pronounced is known as the dicrotic wave, and is probably due to a reflection of the arterial tension on the periphery.

Dictator, an extraordinary magistrate of ancient Rome, first appointed 501 B.C. At first no one was eligible to the office who had not been previously a consul. The power of naming a dictator, when an emergency arose requiring a concentration of the powers of the state in a single superior officer, was vested by a resolution of the senate in one of the consuls. A plebeian dictator was first appointed 356 B.C. The dictatorship was limited to six months, and the person who held it could not go out of Italy. The dictator had the power of life and death, and could punish without appeal. All the other magistrates were under his orders. He had 24 lictors, double the number allowed to a consul. Such were the dictators appointed to carry on the government of the state in special emergencies; but dictators were often appointed for temporary purposes, especially during the absence of the consuls. The object of these temporary appointments was generally to secure the discharge of some function which could only be lawfully performed by the first magistrate, as the holding of the comitia (or meetings) for the elections. The last dictator entrusted with the government of the state under the republic was appointed 216 B.C., the last temporary dictator 202 B.C. The office was revived by Sulla 82 B.C., and afterward held by Cæsar 48 B.C., but in these cases the legal restrictions were not regarded, and the office bore no resemblance but in name to the ancient dictatorship. It was abolished during the consulship of Antonius, 44 B.C. In more modern times usurpers have made themselves dictators. The rulers of Paraguay bore the title of dictator for a number of years, and those of other Spanish-American countries have done so from time to time.

Dictatorships in Latin-America. In Mexico, since the establishment of independence, there have been 10 acknowledged dictatorships, namely, those of Gen. Antonio Lopez de Santa-Anna, 1841 to 1842; Gen. Nicolás Bravo, 1842 to 1843; Santa-Anna again, in 1843; Gen. Valentin Canalizo, 1843 to 1844; Gen. Manuel María Lombardini, 1853; Santa-Anna again, 1853 to 1855; Gen. Rómulo Díaz de la Vega, 1855; Gen. Martín Carrera, 1855; Gen. Juan Álvarez, 1855; Gen. Ignacio Comonfort, 1855 to 1857. The "usual alternations of anarchy and military rule"—the long period of internecine strifes, during which one president after another was summarily deposed—drew to an end about 1876. Gen. Porfirio Díaz succeeded Tejada in May 1877. He was re-elected in 1884, and since that time has remained at the head of the government. In Paraguay, three years after allegiance to Spain was renounced, the congress in October 1814 decided to make Doctor (of theology) José Gaspar Rodríguez Francia dictator for three years. Before the expiration of his term of office, another congress decreed that his

dictatorship should be perpetual. He died 20 Sept. 1840. Francisco Solano López (16 Oct. 1862 to 1 Mar. 1870), though constantly referred to as a dictator, was officially known as "president of the republic." By an act of congress, 16 Oct. 1862, he was made "president of the republic for 10 years," his father, Carlos Antonio López, having been president during the 18 years immediately preceding, that is, from 1844 to 1862. In Bolivia there was at first no need to employ the word dictator, simply because the constitution of that country, framed by Bolívar and accepted without change or even debate by the congress at Chuquisaca, 25 May 1826, conferred ample dictatorial powers upon a "president" who should hold office for life; nevertheless the higher title was repeatedly assumed or conferred (see BOLIVIA for list of presidents and dictators). In Colombia (when it included New Granada, Venezuela, and Ecuador), we find, first, military dictatorships established before 1827 by Páez in Venezuela and by Mosquera in Ecuador; and then the dictatorship of Bolívar, who assumed absolute sovereignty in 1828 over the entire Colombian federation. Almost immediately afterward the federation broke up. The racial aversion to such steady co-operation as the situation called for was intensified by extravagant theories touching the so-called sovereignty of each individual citizen. Thus, it was not merely true that the 21 wretched "sovereign states" of Venezuela could repudiate pecuniary obligations or violate treaties with impunity; that any of the states of New Granada could nullify a law of the federal congress; but it has been well said that every man fancied that he was governed by a "higher law" inherent in himself, and "when he declared against the government he was not a traitor, but only a revolutionist, asserting his inherent right as a 'sovereign.'" In Colombia, from 1830 to 1861, there was a revolutionary outbreak on an average every second year; Ecuador generated a revolution and a new constitution every four years; Venezuela was even more distressed by anarchy. Acceptance of a military despot seemed to be the only escape from these intolerable conditions. The revolutionist Mosquera declared himself dictator of the diminished Colombia in 1867. In Venezuela, as a separate country, the first ruler is sometimes called dictator, sometimes president; he was both by turns, and repeatedly. Similar versatility was exemplified in the troubled lands from Mexico to the far South: as a Venezuelan fashion it easily survived its forceful exponent, Páez. Three short-lived dictatorships were set up in succession just before Crespo entered Caracas in 1892. In Ecuador, the first Flores called a convention (1843) which expressed the temporary desire to entrust him with a magistracy so far above all others that it is superior even to the laws themselves. Again, on 2 April, 1882, President Veintemilla seized power as a dictator and held it for a year. In Peru, Gen. Bolívar was supreme dictator, both during and after the struggle for independence, his license having been granted by the revolutionary congress of 1824 and confirmed in 1826. In Argentina, Juan Manuel Rosas accepted (7 March 1835) an almost unrestricted dictatorship which was offered to him in the hope that he would restore order. He reigned "in a horrible manner, like a madman" up to the day of his defeat, 3 Feb. 1852. In Brazil, the

DICTIONARY

first national congress convened on 15 Nov. 1890, after the expulsion of Dom Pedro II. One year later (Nov. 1891) President Fonseca proclaimed himself dictator on the strength of an invitation of officers of the Brazilian army; but his navy turned its guns on him, and he resigned. In Chile, there have been fewer revolutions, more frequent instances of submission to the mandates of a privileged upper class; yet at the beginning of 1891 President Balmaceda broke with national traditions, to adopt those of the continent of South America: he announced that he was dictator, when he was, in fact, only a party leader; he declared himself to be in favor of martial law, and by superior force he was crushed (see CHILE). In the history of Uruguay, the word "dictator" is not prominent, though the irresponsible government of Artigas, a *Gaúcho* ("Rough Rider") chief, bred disorder after 1814, and comparative stability was first assured after 1870, when the Paraguayan war ended. In Costa Rica (q.v.) several of the chief executive officers have been called dictators, with an intention somewhat less offensive because the policy of the government is conceded to have been, in certain respects, positively commendable. For the other republics of Central America and Santo Domingo, our readers are referred to the articles dealing with those countries, in which special circumstances are explained. The exercise of dictatorial powers by dictators without the name — rulers who had, or have, the title of president merely — will be found under SOUTH AMERICA.

MARRION WILCOX,

Authority on Latin-America.

Dictionary (Low Latin *dictionarium*, first used in the 14th century; from *dictio*, post-classical synonym for *verbum*, word). The various applications of the term, general and special, are so familiar that a detail would be of no service. Of its synonyms, it may be said that the Greek word "lexicon" is customarily restricted to a dictionary of ancient or Oriental languages, with definitions, etc., in the language of the supposed reader; "glossary" and "vocabulary" to dictionaries of the terms used in the special works to which they are attached. A glossary (called by the Germans *idioticon*, by the Italians *vocabolario*) is a defined list of unusual, antique, or foreign words; a vocabulary, in classical works sometimes called an index, belongs to a book in or text-book of a foreign language, and renders the foreign words into the reader's language, or the exercises of the latter into the foreign.

Functions.—The variation of kind with the variation of users and origin, common to all literature, is well exemplified in dictionaries. The original dictionary was a simple definer of words which a cultivated reading class was supposed not to know,—foreign, provincial, technical, obsolete, etc.; the modern dictionary of its own language attempted to exclude nearly all but the accepted vocabulary of current literature,—that is, what people knew already,—or at least what would be needed for such reading; the later ones increasingly include the means of understanding everything ever printed in a language. Two classes only, for obvious reasons, are still excluded (one of which the older ones gave), by reason of the change in audience from men to women and children: gross words, except a few too important philologically to be spared; and argot. The "abridged" diction-

aries for many years, with ludicrous logic, excised the difficult words and retained the familiar ones; the first to exercise common-sense and reverse this plan was Jabez Jenkins in his wonderful "vest-pocket lexicon," whose near 30,000 words contained almost all the unusual ones and the pronunciational cruces. The attempts to draw a line in full dictionaries are now recognized as injudicious: that a word or form of a word has gone out of use is the very reason it should be defined or at least cross-referenced. An incomplete record of the language is by so much unserviceable. Part of the exclusions resulted from the growth of a half-educated middle class who looked to it as a standard of taste. The French Academy at first omitted all technical terms, and all words assumed below its standard of elegant usage; but as this made the book half useless, and the omissions were credited to the Academy's ignorance or carelessness instead of its fastidiousness, it could not be maintained. Recent dictionaries attain the same end by marking words as "obsolete," "little used," "provincial," "colloquial," "slang," "vulgar," etc. The attempted arbitrariness of pronunciations, though inevitable (being among the chief services for which they are consulted), will always remain a battle-ground embarrassing even to the umpires. Still more important, however, is a dictionary's value for the historical development of a language. No dictionary fulfils its best purpose which does not, as far as possible, trace the varying significations from their sources, with their development by metaphor or technical use; and any arrangement which obscures this is vicious; whatever temporary convenience may be subserved. As the validity of this development depends on citation of passages, these should be full, otherwise we have only the arbitrary assertion of the compilers. Back from even this lie the original etymologies of the words, which are of great value and even more interest; and the best dictionaries give them with their affiliations in other languages. All the irregular grammatical forms, and the particles by which words are inflected,—a sufficient grammatical apparatus for correct usage,—should be given as a matter of course. Syllabifications, divisions, etc., should also be indicated: in a word, the dictionary is a proof-reader's vademecum, and must contain all requisite material for him to use.

Arrangement.—The first condition of usefulness being that the items shall be easily found, no arrangement is tolerable except an alphabetical one, in all languages where the inflections are mainly terminal or after a consonant initial. This arrangement, however, may be used only in a key, making feasible other classifications for the main body; as in Roget's well-known 'Thesaurus' of synonyms, where the grouping is by ideas, in parallel column with the reverse ideas. This would be a very useful addition to the meagre lists of synonyms given in the large dictionaries; but it would need great labor and almost impossible accuracy of cross-referencing, as the group heads must be referred to from each word in its alphabetical place. A very useful variant is in the lists of technical terms of arts and sciences given under each main head in the 'Standard Dictionary.' Rhyming dictionaries are arranged alphabetically under the terminations. In etymological

dictionaries, attempts have been made to alphabetize by roots; but as no two scholars ever agree on the roots, the finding is largely guess-work, unless with a full alphabetical key, and scholars condemn the plan. In Semitic languages the arrangement is usually by roots. It was this necessity of arranging Volapük dictionaries, owing to the prefix-inflection involving a search in three or four places for one word, which as much as anything else prevented that "language" gaining favor. The arrangement of Chinese characters is almost incapable of any readily intelligible system, and is not settled by sinologists.

History.—The first dictionaries were used by the Assyrians and Babylonians, to explain not words, but signs. The ancient ideographs, when largely displaced by syllabified or alphabetic signs with phonetic values, rapidly became unintelligible; and syllabaries were therefore compiled, to define them in terms of the latter. The old Sumerian language, however, seems not then to have become "dead," being preserved by the colleges of priests for religious use; and foreign languages were learned from foreigners. These were inscribed in vertical columns, on clay tablets; they have been found in the great library of Asurbanipal (Sardanapalus—668-626 B.C.), at Nineveh, the source of our chief knowledge of Mesopotamian culture. Much the same sort of syllabaries seem to have been used by the Chinese and Japanese.

The ancestry of our own dictionaries, however, is Greek. Here we observe the usual progression from the special to the general. The typical modern dictionary is a complete or representative vocabulary of a language, present and historical, with definitions in its own or some foreign tongue; its object being to interpret either the meaning of the foreign tongue or the bygone part of its own, or the usages and history of the latter. But neither of these was thought of by the ancients. The small upper and priestly class settled their own usages of language, there was no half-educated reading populace relying on books for correct form, there was no foreign literature they cared to read, and foreign conversation they learned from conversation. Their first dictionaries were the same as our special vocabularies. The oldest surviving one, by Apollonius of Alexandria in Augustus' time, was a glossary of Homer's words—probably the oldest of all kinds if we had them, Homer being the common text-book of Greece; others were of ambiguous, corrupt, barbarous, foreign, or dialectic phrases in the tragic and comic poets.—phrases Attic, Lacedæmonian, Cretan, Rhodian, Italian, Phrygian, etc.; others of technical terms in cookery, a fascinating subject to the Greeks; others of drinking vessels, of the cries of animals, of synonyms, etc. Besides glossaries of Homer, there were others of Plato, the Ten Attic Orators, Hippocrates, etc. All of these, so far as preserved,—unhappily, very few of them are preserved, and Athenæus in the 2d century gives the names of 35 lost to us,—are of priceless value both for words and antiquities. On a larger scale were the Onomasticon ("word-book") of Julius Pollux, arranged topically in 10 books, which has survived; and a great lexicon, now lost, written by Helladius of Alexandria about 400 B.C. Of others may be noted an

etymological dictionary by Orion of Thebes about 450, the first we have,—for Varro's essays in Roman etymology can hardly be called a dictionary; a dialectic and local one by Hesychius of Alexandria, in the 4th century; and one of words similar in sound, but unlike in meaning, by Ammonius of Alexandria. Coming down to the Middle Ages, the most famous is that of Suidas, of unknown date or place, but probably about the 10th century; it is a slovenly compilation of words, names, and places, but extremely valuable from its matter, not to be had elsewhere. Overleaping some centuries and their works, we come in 1572 to the mightiest of all, the tremendous 'Thesaurus Græcæ Linguæ' of the famous French scholar and printer, Henri Estienne or Stephanus (q.v.), Geneva, 4 vols., folio, a work gigantic not only in size but in scholarship; it was last reprinted by Didot at Paris, 1831-65, ed. Dindorf, 9 vols. folio, 9,902 pages. All the mediæval and modern lexicons till the 19th century were Greek into Latin; the first Greek-English one was not till 1814, by John Pickering, and that was not finished; the first complete one was by John Jones, 1823, London. For many years the only general one on the market has been the Liddell & Scott, revised by Drisler, in its various editions. This, however, is confined to classic and early-empire forms, to common nouns, and to book words; and leaves need for several additional works. Later and mediæval Greek has been admirably covered by the lexicon of E. A. Sophocles, revised 1887 by J. H. Thayer; and a three-volume lexicon entirely devoted to the vast wealth of forms furnished by the inscriptions is in progress. Smith's dictionaries of antiquities and proper names are gone by, but the only ones in English; in German there are Pape's 'Greek Proper Names' (Griechische Eigennamen) 1875-90. There is one of modern Greek by Contopoulos, Athens, 1889; and there are special glossaries, New Testament and of various great authors, English-Greek, Yonge, revised by Drisler, latest edition 1893.

Less needful are details of Latin dictionaries, though they have been very plentiful; in the Middle Ages they were the daily necessity of all cultivated existence. They began much later than Greek: even the etymological treatise of the great M. Terentius Varro, Cicero's contemporary, preserved only in fragments, can hardly be called a dictionary; the first real one is of Verrius Flaccus under Augustus. One of Gutenberg's volumes was the 'Catholicon' or 'Summa' of Johannes de Janua (Giovanni Balbi), 1460. The monk Calepino published in 1502 at Reggio a Latin-Greek lexicon, which was so famous that for many years all dictionaries were called "calepino"; in 1575 it was made a polyglot of Italian, French, and Spanish as well, and in 1590 extended to all languages, and many times reprinted. Robert Estienne, father of Henri above, published in 1531 at Paris a great 'Thesaurus Linguæ Latinæ,' not supplanted till Forcellini's 'Totius Lexicon Latinitatis' in 1771, at Padua. All these were Latin into Latin, except that the latter had definitions also in Greek and Italian. A new edition with a large supplement, Prato, 1858-79, forms the greatest Latin dictionary ever published. The first Latin-English dictionary was the 'Promptorium Parvulum' of a Norfolk monk, Galfridus Grammaticus, compiled 1440,

DICTIONARY

printed 1499; the first important one was by Sir Thomas Elyot, London, 1538. In the 18th century Robert Ainsworth's was for many years the only popular one (London, 1736). At present the two general popular ones are White & Riddle's (London, 1880), and Harper's (Andrew's Freund, revised by Lewis and Short, 1886). The great German-Latin one is Georges', 4 vols., Leipsic, 1880-5. The English-Latin are Smith & Hall, 1890; White & Riddle, 1869. A giant 'Thesaurus' was started in Leipsic, 1900, to outrank any other Latin lexicon in existence; it is to be edited by the greatest German scholars, under the supervision of the five great German academies, and has not yet finished the letter A. The great dictionary of mediæval Latin is Du Cange's, 1733-6, re-edited Paris 1882-8, 7 vols.

For modern European languages into English and *vice versa*, the following are standard: French—Smith, Hamilton & Legros, 1891; Spiers & Surene, 1891; Gasc, 1895. German—Thieme-Preusser, 1898; Flügel, 1891; Lucas, 1854-68; Whitney, 1877, valuable for etymology; Adler's, 1875, still unequaled for discrimination of synonyms. Spanish—Velazquez, revised by Gray and Iribas, 1901 (the old Velazquez's Seoane revised with a great new technical vocabulary). Portuguese—Lacerda, 1871; Michaelis, 1894; Valdez, 1879. Italian—Baretti, 1877; Meadows, 1869; James and Grassi, 1884; Millhouse, 1899. Dutch—Calisch, 1890. Danish—Ferrall, Repp & Rosing, 1873. Swedish—Wenström & Lindgren, 1889; Nilsson, Widmark & Bollin, 1889. Norwegian—Geelmuyden, 1886. Russian—Alexandrov, 1879. Turkish—Redhouse, 1880. Polish—Baranowski, 1884. Hungarian—Bizonfy, 1878-86.

The great foreign dictionaries of their own languages, corresponding to the 'Century Dictionary' or the 'New English Dictionary' of our own, are: French—Littré's, 4 vols., 1863-72, supplement 1878-82. Larousse's rich work is an encyclopædia. German—Jacob and Wilhelm Grimm, etc., the first volume published 1854, and the work is still unfinished. The brothers Grimm died 1859-63, and a succession of scholars have carried it on, but the parts appear slowly. Italian—Tommaseo and Bellini, four volumes in eight, 1861-79. Castilian Spanish—Dictionary of the Spanish Academy; Donadiu and Puignau, 1890-95; Cuervo's unfinished work, 1866-94. There is also a two-volume dictionary of Catalan, by Lobernia and Esteller. There are of course many other smaller but valuable etymological and historical dictionaries. Of other languages may be mentioned: Portuguese—Caldas Aulete, 1881. Provençal into French—Mistral, 1886. Sardinian into Italian, and *vice versa*, Spano, 1851. Dutch—Dale, 1885-9; Franck, 1884-92. Swedish—Kalkar, unfinished. Icelandic—Cleasby and Vigfusson, 1874. Welsh—Evans, 1887, unfinished. Irish—Foley, 1855; O'Reilly, supplement by O'Donovan, 1864. Russian—Dahl, 1862-73. Polish—Rydzewski, 1866. Slavonian—Miklosich, 1886. Turkish into Arabian and Persian, Zenker, 1866-76. Chinese into Latin, De Guignes, 1877; into French and Latin, 1869. Annamese—Pauthier, in Chinese characters with pronunciation in Chinese and Annamese.

Though Oriental and ancient, their close connection with our racial and religious ancestry and current problems makes Sanskrit and He-

brew worth noting separately. For the former, the great English works are by Monier-Williams: English-Sanskrit, 1851; Sanskrit-English, 1872. Hebrew, Fürst, 1867.

English lexicography on its own language begins very humbly, with John Bullokar's 'English Expositor,' 1616. More famous was Henry Cockeram's, 1623, which passed through nine editions up to 1650. Blount (1656), Philips (1658), and Coles (1677) succeeded these; but the first attempt at a thorough collection was Nathan Bailey's (1721.) This gave etymologies, marked accents, and remained the sole possessor of the field till Johnson's appeared in 1755; and was reprinted over a quarter of a century longer from its handy size, the 24th edition dating 1782. Johnson's, however, is the first of any importance from a scholar's point of view. The etymologies are superseded, but he was the first to make a dictionary something like a history of the language, with full (even over-full) illustrative examples, precise definitions, and attention to the form. It has been reprinted as late as 1866, but for popular use is superseded even in England by the great American dictionaries, and for scholars by special works. It did not mark pronunciation except by accents, like Bailey's. The first to enter on this unending task was Kenrick (1773); then came Perry (Boston, 1777); Thomas Sheridan (1780), the elocutionist, father of the great dramatist; Walker (1791), of immense vogue in its time and still cited as an authority, though entirely out of date; Smart (1836), based on Walker; all making their first claim as arbiters of elegant taste. Richardson (1836) was primarily for etymologies. Ogilvie's 'Imperial Dictionary' (1850, new ed. 1883) was the first of the great encyclopædic dictionaries; the 'Century Dictionary' was at first intended only as a slightly revised reprint of Ogilvie, but swelled into the magnificent work so well known. Previously, another English work of the sort had appeared, Hunter's, 1879-88. But the one monumental English dictionary is to be the 'New English Dictionary on Historical Principles,' edited by James A. H. Murray and Henry Bradley, greatly assisted by the late Fitzedward Hall, from matter collected by the Philological Society. It has reached the letter R at this writing, and will take several years to complete; and will form an absolute history of all English words and meanings. Noah Webster's first dictionary was in 1806, but the first edition of his epoch-making 'American Dictionary' was in 1828. This has become the 'Webster's International Dictionary' of 1890; always connected with Yale College scholarship, through Webster's son-in-law, Chauncey A. Goodrich, and later through Noah Porter. Webster was the founder of American lexicography, and by his enthusiasms and original ideas has left a permanent impress on American usages, even where his pet notions have been discarded. His work brought out its chief rival for many years, 'Worcester's Dictionary' (1860), by a scholar who had assisted him but disliked his innovations, and wished to substitute elegant usage for what he thought Webster's barbarisms. It had great influence for a generation, and has a tenacious tradition yet. The 'Standard Dictionary' (1893-5) is a medium between the com-

pression of Webster and the encyclopædic magnitude of the 'Century.'

Among special dictionaries may be named Jamieson's 'Etymological Dictionary of the Scottish Language,' 4 vols., 1879-82, with a supplement 1887; Wilson's 'Glossary of British India,' 1851, and Yule & Burnell's 'Anglo-Indian Words and Phrases,' 1886; Wright's 'English Dialect Dictionary,' about half finished; Bradley's 'Middle English Dictionary,' 1891; Taylor's 'Words and Places,' several revisions, and Blackie's 'Dictionary of Place-Names,' both etymologies of names; Bartlett's 'Dictionary of Americanisms' (1877), much too inclusive, and Farmer's 'Americanisms, Old and New' (1899); Roget's 'Thesaurus' of synonyms, last edition 1892.

Dictys (dik'tis) of Crete, a follower of Idomeneus in the Trojan war, whose name is attached to a professed journal of the leading events of the contest, which has come down to us in Latin prose, under the title 'Ephemeris Belli Trojani.' An introduction relates how the narrative, inscribed in Phœnician characters on bark-paper, was found in a coffer of tin in Dictys' tomb, which had been burst open by an earthquake in the reign of Nero, and how the emperor caused it to be translated into Greek; this is accompanied by a letter from one Quintus Septimius, who claims to have prepared the condensed Latin version that follows. This dates probably from the 4th century A.D., and though of no intrinsic value, was a chief source of the romances of the Middle Ages. The best editions are those of Dederich (Bonn 1832 and 1837), and Meister (Leipsic 1872).

Dicyemidæ, a family of very lowly multicellular organisms, parasitic in habit. They are found in cuttle-fishes, while related organisms known as *Orthonectida* occur in a brittle-star and in a nemertean worm. The largest species of the genus *Dicyema* measures five sevenths mm.; the smallest is 10 times less. These organisms hardly rise above the level of the embryonic gastrula, and some seem hardly to attain it, but it is still uncertain how much of this simplicity is primitive, and how much the result of degeneration.

Dicynodon, a genus of fossil reptiles occurring in a sandstone, supposed to be of Triassic age, in southern Africa and India. The principal remains yet found, the bones of the head, indicate a gigantic type between the lizards and turtles. The anterior portions of the jaws appear to have been altogether toothless, and they form a kind of beak, which was probably sheathed in horn. The lower jaw has no teeth; but each superior maxilla carries an enormous tusk-like tooth, growing from a persistent pulp. Eye orbits very large, cranium flat, with nostrils divided as in lizards. Order, *Anomodontia*.

Didactic Poetry (from Gr. διδακτικός, pertaining to teaching), has as its object the instruction of the ignorant. In the early ages of Greek literature there was no prose writing. Hesiod taught husbandry and theology in verse, Solon harangued in hexameters. Ever since that time verse has to some extent been used as a vehicle of teaching. The early Ionian philosophers, like Xenophanes, expounded their system in poetry, and, in the later days of the Roman republic, Lucretius, in the finest

didactic poem that was ever written, unfolded the theories of Epicurean materialism. Virgil wrote the 'Georgics' to teach the veterans of Augustus the art of agriculture, and Horace in his 'Art of Poetry' embodied for young Roman poets the Greek principles of dramatic writing, while Ovid set forth systematically the 'Art of Love.' Vida, the Italian, Boileau, the Frenchman, Pope, the Englishman, also wrote in verse an 'Art of Poetry.' English poets have been much inclined to didactic poetry. Darwin's 'Botanical Garden' is a treatise on the Linnæan systems of botany. The longer poems of Cowper are moral lectures. Dyer's 'Fleece' is the shepherd's guide, and even the 'Shipwreck of Falconer' may be looked upon as a manual of seamanship.

Didelphia, a group of mammals comprising the Marsupials (q.v.), so called in reference to the double condition of the generative organs, in the female. Compare *MONODELPHIA*, and see *METATHERIA*.

Diderot, Denis, dè nè dèd-rô, French philosopher: b. Langres 5 Oct. 1713; d. Paris 31 July 1784. 'Philosophic Reflections'—burned by the hangman and therefore widely circulated—and 'A Sceptic's Walk' (1747), were part of a warfare against the Church. In the compilation of the 'Encyclopédie' Diderot bore the main burden. He wrote all the articles on technology and industries, besides many of those on points of philosophy, and even on physics and chemistry. Further proof of his versatility is seen in the admirable reports he wrote (1765-7) of the art expositions at the Paris Academy. He wrote some dramas, but none of them possess any great merit. On the other hand, his novel, 'The Nun,' and his dramatic dialogue, 'Rameau's Nephew,' are wonderfully effective pictures of the corrupt society of the time. His little sketches, 'Little Papers,' are pearls of kindly humor and of witty narrative.

Diderot and the Encyclopedists, a literary study by John Morley, published 1890. This examination of the life, the work, and the influence of "the most encyclopædic head that ever existed" (as Grimm termed Diderot), and his fellow-workers, is an admirable monograph. Of all the literary preparation for the French Revolution the 'Encyclopédie' was the symbol; it spread through the world a set of ideas that entered into vigorous conflict with the ancient scheme of authority. Diderot, as the head of the movement, D'Alembert his coadjutor, Voltaire, J. J. Rousseau, Buffon, Helvetius, Holbach, Raynal, etc., with other famous persons of the day, as Goethe, Garrick, the Empress Catharine II.,—are here vividly depicted, with wide knowledge of books and of life, great skill in reading character, facility in disentangling causes and results, and broad philosophical perception of the historic position of the age. Anglo-Saxon readers find this work less one-sided than Taine's on the same subject. Appended to the book is a translation of the greater part of 'Rameau's Nephew,' Diderot's famous dialogue.

Didier, dê-dê-â, or **Desiderius**, the last king of the Lombards. He was Duke of Istria, and happening to be in Tuscany in 756, when Astolphus, the previous king, died childless, immediately raised an army and laid claim to the throne. Didier was crowned and seemed to

have secured the permanence of his dynasty by marrying his daughter to Charlemagne in 770. The marriage, however, proved unfortunate; and when Charlemagne dissolved it by repudiation, the quarrel between the families became irreconcilable. Didier afterward invaded the Papal States, and made a conquest of a part of them, when Charlemagne interfered. Didier, unable to oppose him, shut himself up in Pavia, when, after a siege of a year, he was obliged to surrender at discretion.

Didier, Charles, shārl, French poet and novelist: b. Geneva 1805; d. Paris 8 March 1864. He wrote some novels designed to awaken patriotic sentiment in Italy, and to make known the struggles of the Carbonari and other revolutionists against Austrian and papal dominion. Among these were: 'Underground Rome' (1833); 'The Roman Campagna' (1842); and 'Fifty Years in the Wilderness' (1857). His lyric poems, 'Melodies' (1827), are characterized less by force than by sweetness.

Didier, Eugene Lemoine, American author: b. Baltimore, Md., 22 Dec. 1838. He edited a weekly paper called 'Southern Society' 1867-9. Among his published works are: 'A Life of Poe' (1876); 'Life and Letters of Madame Bonaparte' (1879); 'Primer of Criticism' (1883); 'The Political Adventures of James G. Blaine.'

Didier, Jules, zhül, French painter: b. Paris 26 May 1831. He studied under Cogniet and Laurens, and won the prix de Rome in 1857. Among his works are: 'Farm on the Ruins of Ostia'; 'Normandy Landscape'; 'Hunting a Hare'; 'Morning on the Borders of the Wood'; 'Agriculture'; 'Ford near Autun'; and 'Return of the Drove.'

Did'ius Sal'vius Julia'nus, Mar'cus, Roman emperor: b. about 133 A.D.; d. Rome 1 June 193 A.D. Having filled the offices of quæstor, ædile, and prætor, he was appointed commander of a legion in Germany, and subsequently governor of Belgica. Having distinguished himself in Africa and Asia Minor, he returned to Rome, and, on the assassination of Pertinax, made himself emperor by bribing the prætorian guards. He now assumed the name of Marcus Didius Commodus Severus Julianus; but, after a short reign of two months was killed in his palace by a common soldier.

Di'do, queen of Carthage. She was the daughter of Agenor (Belus); according to others, of Carchedon of Tyre, from whom Carthage received its name; others call her father Mutgo or Muttinus. Her brother was Pygmalion, king of Tyre. Her father married her to her uncle Acerbas, otherwise called Sichæus or Sicharbas. He was murdered before the altar by her brother, who was instigated by the desire of making himself master of his wealth. She therefore set sail for Africa, with all her wealth and her faithful companions. They landed on the coast of Africa, not far from Utica, a Tyrian colony. She purchased as much land as might be covered with the hide of a bull, which she cut into the thinnest possible strips, and surrounded with it a large extent of territory. Here she first built the citadel of Byrsa, and afterward Carthage. Hiarbas, a neighboring prince, paid his addresses to her. Unwilling to accept and unable to refuse the

proposal, she sacrificed her life on the funeral pile. By an anachronism common with poets, Virgil attributes her death to the faithlessness of Æneas. Dido was worshipped in Carthage as a goddess.

Didon, dē'dōn', J. Henri, PÈRE, French Dominican preacher and writer: b. 17 March 1840; d. 1900. He has attracted much attention for his series of eloquent Lenten sermons. Having come into conflict with his superiors because of his views about democracy, he ceased for a time to preach. His leisure was spent in preparing a life of Jesus, which should be an antidote to the skeptical 'Vie de Jesus' of Renan. This was published in 1891 under the title, 'Jésus Christ,' a book which made a great impression throughout France. He has also written 'Les Allemands' (1884).

Didonceph'alus, a monster with a double range of teeth, or a double jaw.

Didot, Ambroise Firmin, ān-brwāz fēr-mān dē-dō, French publisher: b. Paris 7 Dec. 1790; d. there 22 Feb. 1876. He was a son of Firmin Didot (q.v.) and with his brother Hyacinthe published such important works as 'L'Univers pittoresque'; 'Nouvelle biographie générale,' etc.

Didot, Firmin, French publisher, printer and type-founder: b. Paris 14 April 1764; d. 24 April 1836. He was a brother of Pierre Didot (q.v.). He was inventor of a new sort of script, and an improver of stereotype printing.

Didot, François, frāñ-swā, French printer: b. Paris 1689; d. 2 Nov. 1757. He founded the famous firm of Didot in Paris in 1713.

Didot, François Ambrose, frāñ-swā ān-brōz, French printer: b. Paris 7 Jan. 1730; d. 10 July 1804. He was a son of François Didot (q.v.), and invented many of the machines and instruments now commonly used in the typographic art. From his foundry came the most beautiful types that, up to that period, had been used in France, and he was the first person in France who printed on vellum paper. He took the greatest care to have his editions correct. By the direction of Louis XVI. he printed a collection of the French classics for the use of the dauphin. The Count d'Artois employed him to print a similar collection.

Didot, Henri, òn-rē, French type-founder: b. 1765; d. 1852. He was a son of P. F. Didot (q.v.), and early distinguished himself as a type-engraver. He then applied himself particularly to improve the method of founding types, in which he succeeded by the invention of a new founding apparatus. He called his process "fonderie polyamatype." It is more expeditious than the former mode, and the types are much cheaper.

Didot, Hyacinthe Firmin, ē-ā-sānt fēr-mān, French publisher: b. Paris 11 March 1794; d. Dandon, France, 7 Aug. 1880. He was a son of Firmin Didot (q.v.), and with his brother, A. F. Didot, conducted the business of the house of Didot from 1827.

Didot, Pierre, pē-ār, French publisher and printer: b. 25 Jan. 1761; d. 31 Dec. 1853. He was a son of François Ambrose Didot (q.v.), and succeeded his father in the printing business in

DIDOT — DIE AND DIE-SINKING

1789. In the universal impulse which the arts received from the revolution he aimed at becoming the Bodoni of France, and conceived the plan of a splendid edition of the classic authors in folio, which should excel, if possible, the best editions extant. He spared no expense to adorn them with all the splendor and elegance of the arts of design, and even sacrificed a part of his property to this favorite object. His 'Virgil' (1798) was worthy of these endeavors, and still more so his 'Racine' of 1801, which the French regard as the first typographical production of any age or country. Only 250 copies of these works were struck off. Among the productions of his press, Visconti's 'Iconographie' is particularly distinguished. Didot devoted the efforts of 10 years to the improvement of the types, and caused 18 different sorts, with new proportions, to be cut, with which he printed Boileau and the 'Henriade' in 1819. Didot paid no less attention to correctness and purity of text, and perfect consistency of orthography, than to typographical beauty.

Didot, Pierre-François, pē ār frāñ-swā, French printer: b. Paris 9 July 1732; d. 7 Dec. 1795. He was a son of François Didot (q.v.), and distinguished himself by his bibliographical knowledge. He also became printer to Louis XVIII. He had a great share in the changes made in the character of types, and contributed to the advancement of his art. He published some very fine editions; among them the 'Voyages d'Anacharsis.'

Didron, dē'drōn', Adolphe Napoleon, French archæologist: b. Hautvilliers, Marne, 13 March 1806; d. 13 Nov. 1867. He began in 1844 to publish 'Annales Archéologiques,' devoted to mediæval art and antiquities, which he continued to 27 volumes. This work was completed, long after his death, by the 28th volume, which included a general index. It is a valuable storehouse of mediæval art and archæology. His chief works are a 'Manual of Christian Iconography,' translated from an ancient manuscript, and 'Christian Iconography' (1843), which forms a history of the representations of the persons of the Trinity in art, their attributes, etc.

Didun'culus, a genus of birds allied to the pigeons, and comprising only the one species, *D. strigirostris* of the Navigator Islands. This bird is of special interest as being the nearest living ally of the extinct dodo. It has a length of about 14 inches, with a glossy plumage verging from a velvety black on the back to greenish black on the head, breast, and abdomen. The large beak, which is nearly as long as the head, is greatly arched on the upper half, while the lower is furnished with two or three tooth-like indentations.

Didymæus, did-ī-mē'ūs, a surname of Apollo, either because he was the twin-brother of Diana, or from the double light of the sun and moon, which he lends to men. Under this name Apollo had one of the most famous of his temples and an oracle at Didyma among the Milesians. Pindar calls Diana Didyma.

Didym'ium (Greek, "twin"), a supposed metallic element, isolated from the mineral cerite by Mosander in 1842. The symbol D or Di was assigned to it, and its atomic weight was con-

sidered to be about 143. The name referred to the close resemblance between the new metal and the element lanthanum, which had been discovered by the same chemist, and in the same mineral, a short time before. Recent researches have shown that didymium is not an elementary body, but that it consists principally of two other elements, which are respectively known as neodymium and praseodymium (q.v.). This discovery renders the name "didymium" singularly appropriate for the original substance.

Didymus, Alexandrian grammarian and critic: b. 63 B.C. He was a prolific writer, being celebrated for a treatise on harmony. The difference between major and minor whole tone, recognized by him, is known to this day as "the comma of Didymus," and some modern composers have written in his system. He belonged to the school of Aristarchus, and was contemporaneous with Cicero. By Seneca his works were estimated at 4,000, none now extant.

Die (*Dea Vocontiorum*), the capital of an arrondissement in the department of Drôme, France, is situated on the right bank of the Drôme, at the foot of Mount Glandaz, in a wide and fertile plain. The manufactures are woolen cloth, paper, leather, and silk; there is some trade in cattle and wood, and the neighborhood produces excellent fruit, and the white wine called "Clairette de Die." The town was formerly the seat of a bishop, and previous to the revocation of the Edict of Nantes in 1685, of a Calvinistic university. Among the interesting structures of Die are the old cathedral, with granite columns from an ancient temple of Cybele, and a porch of the 11th century; the episcopal palace, the walls flanked by towers, and the ruins of a castle—all of considerable age, the triumphal arch on the road toward Gap, known as the Porte St. Marcel, portions of an aqueduct, and other Roman remains. There are several mineral springs in the vicinity.

Die and Die-sinking. A die for making a medal or the like is a design engraved on softened steel, which is later hardened, and impressed or sunk in another softened steel surface, for the purpose of making duplicates. While the impressing of a die is specifically die-sinking, the entire art or business of making such dies is generally known by this name. The softened steel original die, on which the engraving is done, is termed the matrix. The relief formed by sinking is a relief-die or punch. This punch after hardening may be sunk into other soft steel surfaces, thus forming duplicates of the original, while the engraved die is laid aside to make more when the punch becomes worn. The duplicates, of course, are also hardened before use.

In making dies for coins or the like, a drawing of the exact size is first made, and from this drawing a tracing is taken for the purpose of transferring to the die. The soft steel blank, which is to form the die, is coated with a thin layer of transfer-wax. The tracing is reproduced on the wax, and the design scratched on the steel through the wax. The design is then deepened by the use of graving tools.

Dies for forming blanks, sometimes termed blanking-dies, have no design, but the punch

is shaped to the outline of the blank, while the female die is shaped so that the punch exactly fits into it. A shearing or cutting edge is given to either the punch or female die, and when the two are fixed in a press, they serve to cut out blanks from a sheet of metal. Where a large number of small duplicate blanks are wanted such dies are usually made in gangs, sometimes being fitted on rollers, so that the sheet of metal, from which the blanks are to be cut, is simply passed between the rolls.

A bending die is a device for bending a blank to some specific form. Such are used in connection with making pedals for bicycles.

Drawing dies for shaping or reducing wire consist of hardened steel plates that are adjusted so as to form a hole of the size and shape to give the wire the desired diameter or cross section. This drawing process also serves to strengthen the wire.

Thread-cutting dies for forming the threads on screws, consist of a series of opposing cutters, arranged so that the depth of the cut increases as the work progresses. The rod that is to form the screws is rotated between these dies, or the dies rotated about the rod.

A great variety of miscellaneous dies are used in the stamping of metal, which operation is common in the manufacture of small metal articles.

For further information as to dies consult 'Dies and Die Making,' by Lucas, Providence, 1897.

Diebitsch-Sabalkanski, Hans Karl (hänts kārł dyī-bēch-zā-bāl-kān'skē) **Friedrich Anton**, Count, Russian general: b. Grossleippe, Silesia, 13 May 1785; d. Kleczwo, Poland, 10 June 1831. He was educated at the military school of Berlin, but in 1801 quitted the Prussian service for that of Russia. He served with distinction in the campaign of 1812; took part in the battles of Dresden and Leipsic, and was made lieutenant-general at the age of 28. He had the chief command in the Turkish war of 1828-9; stormed Varna; and made the famous passage of the Balkans, for which the surname of Sabalkanski was conferred on him.

Diedenhofen, dē-dēn-hōf'ēn. See THIONVILLE.

Diefenbach, Lorenz, lō'rēnts dēf ēn bāh, German philologist: b. Ostheim, Hesse, 29 July 1806; d. Frankfort-on-Main 28 March 1883. He was 12 years pastor and librarian at Solms-Laubach. In 1848 he settled at Frankfort-on-Main, where in 1865 he was appointed second librarian to the city. His literary industry was enormous, embracing poetry and romances, as well as those more ponderous works by which his name will live. His greatest books are: 'Celtica' (1839-40); 'Vergleichendes Wörterbuch der Gothischen Sprache' (1846-51); 'Glossarium Latino-Germanicum mediæ et infimæ ætatis,' a supplement to Ducange's well-known 'Glossary' (1857); 'Origines Europææ'; 'Hoch- und Niederdeutsches Wörterbuch' (with Wülcker, 2 vols. 1874-5).

Dieffenbach, Johann Friedrich, yō hān frēd'rīh dēff'ēn-bāh, German surgeon: b. Königsberg 1 Feb. 1794; d. Berlin 11 Nov. 1847. He was distinguished as an operator especially in the art of forming by transplantation new noses and lips.

Dieffenbachia, dēf-fēn-bāk'ī-ā, a genus of *Araceæ* (arum family), of which there are about 15 species, found in the woods of South America and the West Indies. Their leaves have sheathing petioles, and are often variegated. Their form of inflorescence is the spathe-enclosed spadix characteristic of the order, the spathe in *Dieffenbachia* being green or yellowish. The best-known species is the dumb cane of the West Indies (*D. seguina*).

Diego Garcia, dē-ā'gō gār-thē'ā, an island of the Indian Ocean, in lat. 7° S., and lon. 72° to 73° E., extends in an irregular horseshoe shape, and is 30 miles long, embracing between its extremities three minor islets (the Chagos Islands). It contains a spacious bay, and is very convenient for coaling purposes. The group has about 700 inhabitants, and is a dependency of Mauritius.

Diégo Suarez, swā-rās, a town and territory, owned by France, in the extreme north of Madagascar, on the east coast, a little south of Cape Amber. Pop. 5,000.

Dielec'tric, a name applied by Faraday to any medium through or across which electrostatic induction can take place. (See INDUCTION, ELECTROSTATIC.) Solids, liquids, and gases possess this property of transmission, though in differing degrees, and their dielectric value, or specific inductive capacity, is measured by the ratio of the capacity of a condenser in which each may form the insulator, to the capacity of the same condenser with a vacuum as insulator.

Diel'man, Frederick, American painter: b. Hanover, Germany, 25 Dec. 1847. He removed to the United States in childhood, and was graduated at Calvert College. He was a topographer and draughtsman in the United States Engineer Department 1866-72; studied art under Diaz at Munich, and established a studio in New York in 1876. He was the designer of the mosaic panels, 'Law' and 'History' in the new Congressional Library at Washington, D. C.; and was president of the National Academy of Design in 1900.

Diēlytra, dī-ē'lī-tra, a genus of plants belonging to the natural order *Fumariaceæ* or fumitories. The best-known in this country is the *D. spectabilis*, a native of northern China and the neighboring parts of Siberia, which was discovered in 1810, and is now everywhere common in Europe as a garden plant. It blossoms in April and May, and its long drooping racemes of purplish-red blossoms present a very graceful appearance. It grows freely in the open air, and only requires the protection of glass in the winter. It prefers a sunny position and a light but fertile soil, and may be propagated by division of the root. In Germany it receives the popular name of pendant heart or virgin's heart, from the shape of the blossoms.

Diepenbeeck, dē'pēn-bāh, **Abraham van**, Flemish painter: b. Bois le Duc 9 May 1596; d. Antwerp 1675. He first studied glass painting, and a number of windows in different churches in Antwerp are his work. Later he studied under Rubens. Among his paintings are: 'St. Norbert'; 'Ecstasy of St. Bonaventura'; 'St. Francis Adoring the Sacrament'; 'Entombment of Christ'; 'Neptune and Amphitrite'; and the 'Flight of Clœlia.'

Dieppe, dê-êp, France, seaport, in the department of Seine-Inférieure, 93 miles north-northwest of Paris. The harbor accommodation is extensive, there being an outer harbor and four or five inner basins or docks, and the depth of water is sufficient for vessels of considerable burden; but the entry to it is somewhat difficult. The manufactures include works in ivory, the most famed in Europe; works in horn and bone, lace-making, sugar-refining, and ship-building. Pop. 21,091.

Dies Fasti et Nefasti, dī'êz fās'tī ēt nē-fās'tī, a Roman division of days, with reference to judicial business, into working-days and holidays. *Dies fastus* was a day on which courts could be held and judgments pronounced; *dies nefastus*, a day on which courts could not be held nor judgments pronounced. Assemblies of the people could be held only on the former. *Dies interdicti* were half-holidays. Morning and evening were *nefas*; the time between morning and evening sacrifice *fas*. As will be immediately noticed the observance of these holidays (*feria*) bore a strong analogy to our Sunday with its suspension of business and visiting places of worship.

Dies Iræ, dī'êz ī'rē, the first two words used as the title of a celebrated Latin hymn on the Last Judgment. This incomparable hymn consists of 17 stanzas, with an 18th of 4 lines, and is based on the prophetic passage, Zephaniah, i. 14-18. It is probably the work of the Franciscan, Thomas de Celano, who died about 1255. The sublimity and force of its thoughts are well matched by the impressive solemnity of the verse, its stanzas of three lines, each with the same double rhyme, making the inmost soul tremble, "as with three blows of a hammer," says Guericke. It is said to have first appeared in the missals made at Venice about 1250, and is one of the five 'Sequences' that have been universally used in the Roman Catholic Church since the Council of Trent. Its place is in the *Missa in commemoratione omnium fidelium defunctorum*. The Tridentine text, published in 1567, is somewhat different from that in the old missals, and another and considerably inferior version appears on a marble tablet of unknown date, in a Franciscan church at Mantua. The *Dies Iræ* has been the subject of musical compositions by Palestrina, Haydn, Cherubini, and Mozart, and no religious poem has been more frequently translated. There are English translations by Crashaw, Macaulay, Lord Lindsay, Isaac Williams, and Gen. John A. Dix. The opening stanzas are paraphrased in the 'Lay of the Last Minstrel,' canto vi. Goethe has felicitously introduced a few stanzas into his 'Faust,' and, in his novel 'Ferragus,' Balzac has given a thrilling description of its effect, when sung at a funeral or requiem mass. The following is the full text:

Dies iræ, dies illa,
Solvat sæclum in favilla,
Teste David cum Sibylla.

Quantus tremor est futurus,
Quando Juxta est venturus,
Cuncta stricte discussurus!

Tuba mirum spargens sonum
Per sepulchra regionum,
Coget omnes ante thronum.

Mors stupebit, et natura,
Cum resurget creatura,
Judicanti responsura.

Liber scriptus proferetur,
In quo totum continetur,
Unde mundus judicetur.

Judex ergo cum sedebit,
Quidquid latet apparebit,
Nil inultum remanebit.

Quid sum miser tunc dicturus,
Quem patronum rogaturus,
Cum vix justus sit securus?

Rex tremendæ majestatis,
Qui salvandos salvas gratis,
Salva me, fons pietatis.

Recordare, Jesu pie,
Quod sum causa tuæ viæ,
Ne me perdas illa die.

Quærens me sedisti lassus,
Redemisti crucem passus,
Tantus labor non sit cassus.

Juste judex ultionis,
Donum fac remissionis,
Ante diem rationis.

Ingemisco tanquam reus,
Culpa rubet voltus meus
Supplicanti parce, Deus.

Qui Mariam absolvisti
Et latronem exaudisti
Mihi quoque spem dedisti.

Preces meæ non sunt dignæ
Sed tu bone, fac benigne,
Ne perenni cremer igne.

Inter oves locum præsta,
Et ab hædis me sequestra,
Statuens in parte dextra.

Confutatis maledictis,
Flammis acribus addictis,
Voca me cum benedictis.

Oro supplex, et acclinis,
Cor contritum quasi cinis,
Gere curam mei finis.

Lacrymosa dies illa
Qua resurget ex favilla,
Judicandus homo reus;
Huic ergo parce Deus.

Amen.

Dieskau, Ludwig August, lood'vīg ow'-goost dēs'kow, German general in French service: b. 1701; d. Surene, near Paris, 8 Sept. 1767. He was adjutant of Marshal Saxe, whom he accompanied in the campaigns against the Netherlands, and became in 1748 brigadier-general of infantry, and commander of Brest. In 1755 he sailed as field marshal to Canada, at the head of French troops, to assist in the campaign against the English. He ascended Lake Champlain with the design of attacking Fort Edward, defeated a detachment sent for its relief, and pursued them to the fort with the hope of entering it with them. He was, however, defeated.

Diest, dēst, Belgium, town in the province of Brabant, 32 miles northeast of Brussels. It was once strongly fortified. Pop. 8,531.

Diet, a meeting or assembly of delegates or dignitaries convened and held from day to day for legislative, ecclesiastical, political, or administrative purposes; specifically, the legislative assemblies of the German empire, Austria, the cantons of Switzerland, etc. The Diet of the German empire was composed of three colleges; one of electors, one of princes, and one of imperial towns, and began with the edict of Charles IV. in 1356. Each college deliberated by itself the agreement of all three together with the assent of the emperor being finally necessary for passing judgment. The best-known meetings were those at Nuremberg 1467, Worms

DIET — DIETETICS

1521 (at which Luther was excommunicated), Spire 1529, and Augsburg 1530.

Diet. See NUTRITION.

Dietetics is the branch of hygiene that deals with the recovery or maintenance of health by right habits of eating and drinking. Diet is the daily fare regulated in accordance with a scientific study of foods and of the needs of the human body. The words diet, dietetics, and dietary, in their modern significance, appear to have a mixed origin. The dictionaries trace their derivation through the French *diète* to the Latin *dieta* and the Greek *diatta*, the latter signifying a manner of living. Another meaning, often marked archaic or obsolete by lexicographers, is "daily fare," "allowance of food," "daily pay."

And for his diet, there was a continual diet given him of the king of Babylon, every day a portion until the day of his death, all the days of his life.—Jeremiah lii. 34.

This meaning has an evident connection with the Latin *dies*, day, and is followed in the modern use of the word dietary. As defined by Mrs. Ellen H. Richards, a dietary is "a known amount of food, of known composition, per person, per day." Popularly, dietary appears to

periments of German chemists. The *erbswurst*, or pea sausage, a food having merit for emergencies, was devised by scientists at that period. Oleomargarine was the result of experiments made for the navy under direction of the French government. The aim of dietitians of the present day includes all that has gone before, the best use of materials at hand, prescription of food for the sick, and aid to the well in choosing such foods as shall maintain health, with due regard to pleasing the palate. The 20th century finds prevention wiser than cure, and endeavors by the prescription of food adapted to different ages and conditions of body to develop the sound body and sane mind. At the present time no less emphasis is laid upon diet for diseased conditions of the human body than in the past, but more attention is being given to building up healthy bodies, and then sustaining them by foods chosen with special reference to the work each individual has to do. Some study of dietetics is now included in the preparation of the citizen for life. In the public schools it is a part of the lessons in physical training, cooking or domestic science. A practical course in dietetics would cover the source and manufacture of foodstuffs, the processes of cookery

UNITED STATES DEPARTMENT OF AGRICULTURE. *Nutritive Ingredients (or nutrients) of food.*

Food as purchased contains —	{	Edible portion	{	Water.
		e. g., flesh of meat, yolk and white of eggs, wheat, flour, etc.		Nutrients
		Refuse, e. g., bones, entrails, shells, bran, etc.		<div style="display: inline-block; vertical-align: middle; font-size: 2em;">{</div> <div style="display: inline-block; vertical-align: middle;"> Protein. Fats. Carbohydrates. Mineral matters. </div>

Uses of nutrients in the body.

Protein	Forms tissue	}	All serve as fuel to yield energy in the forms of heat and muscular power.
e. g., white (albumen) of eggs, curd (casein) of milk, lean meat, gluten of wheat, etc.			
Fats	Are stored as fat.....		
e. g., fat of meat, butter, olive oil, oils of corn and wheat, etc.			
Carbohydrates	Are transformed into fat...		
e. g., sugar, starch, etc.			
Mineral matters (ash).....	Share in forming bone, assist in digestion, etc.		
e. g., phosphates of lime, potash, soda, etc.			

be associated with cheap fare, perhaps because first used in connection with the allowance of food for paupers and prisoners. The word diet also conveys to the average mind the idea of a reduced food supply, probably because the individual choice is restricted.

Under primitive conditions, men satisfied hunger with any edible substances within reach. The progress of civilization, with the increase of material possessions, developed the epicure and gourmand, who magnified the pleasures of the table. The aid of the physician was then required to mitigate woes induced by over-indulgence. In the days of Hippocrates, dietetics was the province of physicians, who thus aimed to undo the evils caused by wrong living. Later, economists like Count Rumford applied dietetic principles to feeding the poor of European cities. Some countries have employed experts to prescribe rations for keeping army and navy in fine physical condition at least expense to the government. The victory in the Franco-Prussian war of 1870 has been ascribed to the food ex-

and wise combinations of foods, the calculations of dietaries for individuals, families and institutions, and the adaptation of foods to individual needs according to age, sex, climate and occupation. Students of history and sociology are recognizing the effect of food in forming individual and national characteristics. The French revolution, and the destruction caused later by the Communists, has been ascribed to the ill-fed condition of the people.

Fresh air, pure water, and clean food are more essential for nutrition than any special selection of foods. The surroundings and instincts of a people lead them to adapt their diet to the climate. In the tropics fruits and vegetables are the main sources of subsistence, in arctic regions foods are chiefly animal and largely fat, supplying the heat needed by bodies subjected to severe cold. A mixed diet, both animal and vegetable, has produced the most successful races.

The usual classification of food substances is outlined by the United States Department of Agriculture in the above table.

DIETETICS

Sometimes it appears difficult to reconcile practical usage and scientific experiment as to food values, but this is due to an incomplete view of both sides. Many statements about foods are untrue because only one phase is presented. To decide upon the full value of any food we must consider both its physical and chemical composition, its economic value and its physiological effect in the body. The elimination of refuse, and the division and subdivision of particles in the process of manufacture are important factors in the nutritive value and digestibility of foods. Some experiments have shown that a larger percentage of peas and beans was digested when thoroughly cooked and sifted, after removing the hull, than when cooked whole. Such external digestion saves energy in the human organism. Whatever tends to cleanse and purify foods before cooking undoubtedly increases their real nutritive value. Medical authorities on dietetics have laid much stress upon the choice of foods, but hardly enough upon their preparation. A piece of meat or a vegetable, however innocent in itself, may be ruined in cooking, while one of doubtful value, by right processes of cookery, may become harmless and even useful. This is equally true from the economic standpoint. Count Rumford found that "the richness or quality of a soup depended more upon the proper choice of ingredients and a proper management of the fire in the combination of these ingredients, than upon the quantity of solid nutritious matter employed; much more upon the art and skill of the cook than upon the sums laid out in the market." The nutritive qualities of many foods are doubtless made more available by a wise use of flavors, which in themselves contain little or no nutriment. Condiments and spices, tea and coffee, and the extractives of meats are of special value for the flavor which they impart. The cheap substantial grain foods after all provide the larger part of the food of the human race, and are made palatable by changes in flavors.

The hours and arrangement for meals have an influence in the assimilation of food. Breakfast in America is a more substantial meal than it is in Europe, perhaps from climatic conditions. The midday dinner seems best adapted to children and invalids, the night dinner is a concession to the competition of business. One dietetic authority estimates that more than half of the day's ration of protein and fat and one third of the carbohydrate is taken at dinner. Therefore the hour of the meal should be such as to provide for a period of rest afterward. The savage gorges himself when food is abundant, then sleeps like an animal. The gourmand of classic days took an emetic to relieve his stomach that he might partake of delicacies yet to come. The best thought of the present day tends to shorter menus and simpler compounds, toward "plain living and high thinking."

Dietetic theories vary from age to age because of imperfect knowledge of bodily processes, or because of changes in the production and preparation of foods. Water, for example, was once excluded mainly from the dietary of patients suffering from fevers, and its use restricted in other cases. Now it is recognized that a lack of water in the diet is a serious error, and that many of our

foods as served are not sufficiently diluted with water. In the past an exaggerated nutritive value was ascribed to beef tea and to gelatine, but later investigations show that the one should be classed as a stimulant, and the other not so much a real food as a protein sparer. Other points regarding which opinions have changed are these: The relative merits of different preparations of wheat, especially of the whole wheat and white flours. The former is probably better for young children, because it supplies bone-making material, but by modern methods of milling most of the nutritive material in the grain is retained in the best grades of white flour. The natural instinct of children for sweets has been repressed, but now sugar is recognized as a valuable food, provided it is taken at proper times. Oysters are less nutritious than is popularly supposed, and as ordinarily cooked are not especially easy of digestion. Combinations of foods often produce different effects from the separate ingredients, and small quantities of certain things may be helpful where larger quantities would produce bad results. A food may be nutritious, economic in the true sense, and prepared in such a way as to be easily acted upon by the digestive organs, and yet fail of perfect assimilation because it does not suit the habit or whim of the eater. In popular estimation a food is digestible when no feeling of discomfort follows after eating it, or when it is easily and quickly digested. The scientist considers a food digestible in proportion as it is completely digested whether the time be shorter or longer. Persons in health should consume some foods that digest slowly, and beware of depending upon pre-digested foods. If allowed to be idle, the stomach, like any other organ, soon finds it difficult to work.

The seven ages of man described by Shakespeare might illustrate the different periods of life calling for a change in diet.

The infant thrives and grows on a diet of milk. When the mother cannot supply a sufficient amount, clean milk from a healthy cow, by dilution with water or whey and by modification with milk and cream, may be adapted to the increasing needs of a baby as it develops. Greater cleanliness in collecting and transmitting milk to consumers is a first requisite for the diet of young children. Defective nutrition causes indigestion, rickets, intestinal catarrh and many disorders of childhood.

The schoolboy requires abundant food from which to construct his rapidly growing body and to provide energy for his active exercise. With him quantity is often more important than quality, while his sister, enjoying less active sports, is over-fastidious. Dainty children and excessively greedy ones both are usually ill fed. Nervous diseases of children, even stammering, will yield to more careful diet. Milk, fruit, cereals, whole wheat bread, eggs and vegetables should form the bulk of the diet of school children. The school luncheon now receives considerable attention from educators.

The lover and the soldier represent the college days and the strenuous life of early manhood. The training-tables for athletes in school and college are an admission of the need of a selected diet for special work. The definition of an army, given by a famous general—an animal that crawls on its stomach—indicates

DIETETICS

the importance of proper food for the soldier. No less necessary is it for captains of industry, pioneers and explorers of all kinds. Personal idiosyncrasy and differentiation of occupation demand attention to the individual dietary.

The justice is the type of the prosperous man of sedentary habit who is often overfed, and who should begin modifying his diet after passing the half-century mark, but habits are formed and changes must be made gradually. Luigi Cornaro, an Italian who lived in the 15th and 16th centuries, began at 40 to modify his diet and succeeded in passing the century limit. After he had reached 80 years he wrote several treatises describing his manner of living. That his writings are still the basis for much that is written on diet for the later years of life, is a sad commentary on the self-indulgent habits of the human race, which shorten many valuable lives.

I have come to the conclusion that more than half the disease which embitters the middle and latter part of life is due to avoidable errors in diet, . . . and that more mischief in the form of actual disease, of impaired vigor and of shortened life, accrues to civilized man . . . from erroneous habits of eating than from the habitual use of alcoholic drink, considerable as I know that to be.

SIR HENRY THOMPSON.

Last of all comes old age, and for this period the food should be similar to that of the young child, and taken often in small quantities. In proportion as activity diminishes, the intake of food should decrease. The sense of taste is dulled and higher seasonings may be desirable. Here if anywhere in a normal diet the stimulus of alcoholic beverages may be allowed.

During the last of the 19th century much data has been collected showing how people actually live, the cost of living and the proportions of protein, fat and carbohydrates. The studies on food and dietaries conducted by the United States Department of Agriculture have furnished much valuable data which is being used as the basis of further work on dietetics by authorities on both sides of the Atlantic. From such studies may be deduced approximate dietaries for different conditions. The ration enabling a man to do good work must necessarily be larger than one calculated merely to sustain life.

An estimated life ration for one day, measured in grams:

Protein.	Fat.	Carbohydrates.	Calories.
75.	40.	325.	2,000.

When poor families are found living on rations lower than this their diet must be enriched before they can be expected to display much energy. Prisoners often have different rations according to their time of sentence in some reformatories, and a man refusing to work is fed with stimulating food until he desires to expend some of his accumulated energy. A work ration would provide in grams:

Protein.	Fat.	Carbohydrates.	Calories.
125.	125.	450.	3,500.

For severe labor this would be increased. (The calory is approximately the amount of heat which would raise one pound of water 4° F. and is a convenient standard of measure of the fuel value of food. The fuel value of protein is 4 calories per gram, or 1,820 calories per pound; fuel value of fats, 8.9 calories per gram, or 4,040 calories per pound; fuel value of carbo-

hydrates, 4 calories per gram, or 1,820 calories per pound.)

The estimate of the value of food in construction of new tissues is less simple than its fuel value. It is impossible to measure the amount of good that might be done in schools, hospitals, and public institutions by improving the conditions of diet. Many hospitals now employ trained directors to make dietaries and superintend their preparation. The United States Department of Agriculture issues many valuable dietary bulletins.

Diet for the sick may be considered under three general heads: the typical ration for invalids, in fluid form, suitable for the crisis of acute disease; food for the convalescent or for building up a body wasted through lack of nutrition; and last, such diet as may aid in the reduction of an overloaded body but yet sustain the vital forces. For the first few days of an acute illness the human body may sustain itself on the surplus stored in its tissues. An invalid in bed is not using up energy so fast as the man at work, hence the diet should be less generous, not a work ration but a life ration increased in such directions as may best combat the waste of disease. Liquids are easily taken, quickly absorbed, and as a whole are less irritating than solids to the digestive organs. Concentrated foods are necessary in certain conditions, but these are few. A sick person for the time being is to be fed much like an infant—small quantities of food should be given often, usually warm rather than cold. Pre-digested foods should not be used until ordinary forms fail. Where there are wasted tissues to repair—as in convalescence or in diseases like anæmia, nervous prostration, or tuberculosis, the diet must be generous—milk and eggs are the main dependence, and the art of cookery has devised many simple ways of serving them. Fat, in easily digested forms—olive oil, bacon, cream, and butter—is valuable in such cases, because fat is two and a fourth times as valuable for fuel food as the carbohydrates. For the capricious appetite attractive arrangement and service of the food, and the element of surprise are important. The cookery for the sick conforms to the usual formulas, though greater attention must be given to the selection of food and its preparation, and all doubtful articles must be avoided. Starches should be thoroughly cooked, woody fibre reduced by cooking and mashing, or removed by straining. Animal foods should be cooked at low temperature. High, composite seasonings are not desirable, but a moderate use of simple flavors is admissible. Gout, rheumatism, and obesity may not be due to over-eating in one sense, but indicate an excess of certain substances which are neither assimilated nor eliminated, but are stored up in the various tissues, causing discomfort. The many fasts of the early Church perhaps were introduced less as a religious duty than as a wise dietetic measure. The "Banting" system for the reduction of fat consists mainly in decreasing the allowance of starch and fat and increasing the protein. Special diets for other diseases should, like medicine, be prescribed by the physician in charge, because of the complications to be considered. Water-cures, milk-cures, and grape-cures have been successful in some cases. Increased knowledge of bacteria has explained many heretofore

DIETRICH — DIFFERENTIAL THERMOMETER

mysterious cases of poisoning, and has changed the point of view regarding the wholesomeness of various food products. Greater attention to cleanliness in all preparation of foods would make the use of preservatives practically unnecessary. With our rapid increase in prosperity Americans in future need to guard against over-indulgence of the sense of taste and to control the appetite to accord with the true needs of the body.

Bibliography.—Some of the most useful books on this subject are these: Abel (Mary H.), 'Practical Sanitary and Economic Cooking'; Atwater (W. O.), 'Principles of Nutrition and Nutritive Value of Food' (United States Department of Agriculture); Burnett (R. W.), 'Foods and Dietaries'; Chapin (H. D.), 'Theory and Practice of Infant Feeding'; Dukes (Clement), 'School Diet'; 'Food as a Factor in Student Life' (University of Chicago); Fothergill (J. M.), 'Manual of Dietetics'; Hart (Alice M.), 'Diet in Sickness and Health'; Holt (L. E.), 'Care and Feeding of Children'; Hoy (A. H.), 'Eating and Drinking'; Hutchison (R.), 'Food and Dietetics'; Knight (Jas.), 'Food and Its Functions'; Langworthy (C. F.), 'Dietary Study of Groups, etc.' (Bulletin United States Department of Agriculture); Miles (E. H.), 'Muscle, Brain, and Diet'; Richards (Ellen H.), 'Cost of Food'; 'Plain Words About Food'; Richards and Williams, 'Dietary Computer'; Thompson (Gilman), 'Practical Dietetics'; Thompson (Sir Henry), 'Food and Feeding'; Yeo (I. B.), 'Food in Health and Disease.'

ANNA BARROWS,
Teacher and Editor, Boston, Mass.

Dietrich, dēt'rīn, Christian Wilhelm Ernst, German painter: b. Weimar 30 Oct. 1712; d. Dresden 24 April 1774. The picture of a peasant drinking, in the Dutch style, executed by Dietrich while a boy, is in the Royal Cabinet of Engravings at Dresden. He successfully imitated Raphael and Mieris, Correggio and Ostade. His paintings are scattered through almost all Europe. In the Dresden gallery, of which he was inspector, there are 34 of them.

Dietrich von Bern, fōn bērn, a hero of German legend, celebrated for his amazing adventures, and figuring in the 'Nibelungenlied.' He was in actual life Theodoric the Great, founder of the Ostrogoth monarchy; but the two names have resulted in much confusion of legend with fact. He flourished in the 5th and 6th centuries of our era. Bern is German for Verona, the principal residence of Dietrich.

Dietrichson, dē'trīk-sōn, Lorents Henrik Segelcke, Norwegian poet and historian of art and literature; b. Bergen 1 Jan. 1834. While an undergraduate in the University of Christiania, he composed many clever student songs which were collected and published in 1859. He published the poem 'Olaf Liljekrans' in 1857, and 'Kivleslätten' in 1879. His writings are numerous and among them are: 'Didactic Poetry in the North' (1860); 'The Art of Wood Sculpture in Norway' (1879).

Dieu et Mon Droit, dē-ē mōn drwā (Fr. signifying "God and my right"), the motto of the arms of England, first assumed by Richard I., who flung this battle-cry at his French adversaries during the engagement at Gisors, 1195, to

intimate that he did not hold his empire in vassalage of any mortal. It was revived by Edward III. in 1340, when he claimed the crown of France. Except during the reigns of Elizabeth and Anne, who used the motto, *Semper eadem*, and of William III., who used *Je maintiendray* as his own motto (*Dieu et mon droit* being retained on the great seal), it has ever since been the royal motto of England.

Dieulafoy, Jeanne Rachel Mayre, zhōn rā-shēl mār dē-ē-lā-fwā, French descriptive writer and novelist: b. Toulouse 29 June 1851. She is the wife of A. M. Dieulafoy (q.v.). Her narrative of travel in 'Persia, Chaldæa, and Susa' (1886), and her fiction 'Parysatis' (1890); and 'Rose d'Hatra' (1891), are evidences of her talent.

Dieulafoy, Auguste Marcel, French engineer: b. Toulouse 3 Aug. 1844. In 1885 he discovered in Persia the remains of the royal residences of Artaxerxes. His discoveries are described in his 'L'art antique de la Perse' (1884-9).

Diez, dēt., Friedrich Christian, German philologist; b. Giessen 15 March 1794; d. Bonn 29 May 1876. Having qualified himself as a lecturer at Bonn, he was appointed professor of modern languages there in 1830. In addition to various works on the poetry of the Troubadours, he published a very valuable 'Grammatik der Romanischen Sprachen' (1836-42), which was translated into English, and an 'Etymologisches Wörterbuch der Romanischen Sprachen' (1853), also translated into English. Diez laid the foundation of Romance philology, and to him all later investigators are profoundly indebted. His work stands in much the same relation to the Romance dialects as the researches of Grimm occupy with respect to the German dialects.

Difference, in heraldry, an additional figure or an alteration in a coat-of-arms to distinguish one family from another of the same strain, or particularly to mark the difference between brothers and their descendants during the lifetime of the head of the house. Sometimes this is accomplished by variations of the bordure, such as having it ingrailed, invected, embattled, etc. But usually the eldest son bears a label or lambel; the second son, a crescent; the third, a mullet; the fourth, a martlet; the fifth, an annulet; the sixth, a fleur-de-lys; the seventh, a rose; the eighth, a cros-moline; the ninth, a double quatre-foil.

Such marks of heraldic distinction cannot be regulated by cast-iron rule or set law. Each country follows the customs resulting from its own particular régime, which seem to be the adoption of changes on an escutcheon best suited to individual needs. Difference is commonly confounded with Cadency (q.v.).

Differential Calculus. See CALCULUS.

Differential Thermometer, an instrument, for determining the difference of temperatures between two points or places. That of Sir John Leslie is one of the best known, and will be found described under THERMOMETER. His invention is now used only as a thermoscope. A pair of thermo-electric junctions (see THERMO-ELECTRICITY) is generally preferable to any other kind of differential thermometer. One of the junctions is put at one of the points, and the

DIFFERENTIATION — DIFFUSION

other junction at the other point, and a galvanometer is introduced in the usual way into the circuit, great care being taken to keep all the other junctions of whatever kind that occur in the arrangement strictly at the same temperature. The strength of the current generated, which is measured by means of the galvanometer, is, with the limitation that will be found explained under the article just alluded to, proportional to the difference of temperature between the two thermo-junctions; and with the assistance of a previous experiment at known temperatures on the thermo-junctions employed, the absolute difference of temperature between the two points at which the junctions are placed may be determined with great exactness.

Differentiation, in biology, that organic process which occurs when certain parts of a uniform whole become structurally different from the others, or when, in other words, the homogeneous becomes heterogeneous. Inequality in internal and external conditions of life brings about restriction of certain vital processes and the predominance of others, and as this division of function is established, diversity of structure results. Differentiation is the structural change which is associated with the physiological "division of labor," and the process is essentially the same whether it find expression in cells, tissues, organs, or entire organisms. See DIVISION OF LABOR; EVOLUTION; VARIATION; etc.

Diffraction of Light, the bending of the rays of light, due to interference, as of the slits or ruled lines in a diffraction grating. The study of the diffraction of light has given us the spectrum, and the study of spectrums, through the spectroscope, has added greatly to the sum of human knowledge of the constituents of heavenly bodies. A simple way of noting the diffraction of light is to darken a room and allow a ray to penetrate between the edge of a shade and the window jamb. The light falling on the opposite wall is not a well-defined streak, like the aperture through which it passes, but is divided into a series of upright streaks or bands, showing that the rays of light bend or are diffracted in passing through the slit. Interesting experiments with diffraction can be made by allowing the light to pass through a hole or holes of different forms. The phenomena of diffraction were first noted and commented on by Grimaldi, of the Jesuits' college of Bologna, in 1665. Sir Isaac Newton investigated the subject, and explained it further. About 1819 Fresnel demonstrated that interference was result of the wave motion of light and that sound waves are similarly affected. Joseph von Fraunhofer, of Munich, made a most exhaustive study of diffraction, and classified the lines of the spectrum, which became known as "Fraunhofer's lines." He invented the diffraction grating about 1821, for exhibiting the lines and forming the spectrum. This grating, as at first made, was a glass surface, smoothed as perfectly as possible, and covered with a thin film of gold-leaf, lampblack, gelatine, or the like. Through this film were scratched or ruled parallel lines, constituting minute apertures for light. In order that these lines might be made very fine, close, and accurate, the dividing engine (q.v.) was devised. With this were ruled a great many thousand lines to

the inch. These lines must be exactly the same distance apart to be valuable. When the light was allowed to pass through the rulings or slits of this transmission grating to a screen, the light on the screen was divided or dispersed, appearing in bands, and forming a spectrum. It was found that to obtain a satisfactory spectrum, a grating of 15,000 to 20,000 lines to the inch was desirable, and even very much finer rulings have been demanded and manufactured. In order to use gratings ruled on plane surfaces for spectroscopic purposes, it is necessary to employ a telescope and collimator. After a time the reflecting grating was invented. In this a surface of speculum metal was ruled, and this had some advantages over glass. Prof. Henry A. Rowland, of Baltimore, has achieved distinction in the production of improved diffraction gratings, making a reflecting grating with a concave surface, that can be used without lenses. The diffraction grating has been much used in studying the solar spectrum. See LIGHT; SPECTRUM; SPECTROSCOPE.

For further information as to diffraction gratings, see 'Gratings in Theory and Practice,' in 'Astronomy and Astro-Physics,' Vol. XII., 1893. For information as to diffraction, consult Preston, 'Theory of Light' (London 1895).

Diffusion, in physics, is the gradual and spontaneous molecular mixing of two fluids in contact. It takes place regardless of or in opposition to gravitation, and is due to the mutual attraction of molecules. Diffusion is most common between gases, and the lighter the gas the faster does diffusion take place. It also occurs between viscous substances and, in some cases, between solids. A common experiment for exhibiting the diffusion of gases is to place in contact vessels of hydrogen and oxygen. After a time it is found that the contents of both vessels are alike—a homogeneous mixture of the two gases. If the heavier gas is placed below the lighter, the result is the same, demonstrating the fact that gravity does not check the result. If chlorine is one of the gases used, its color will enable the eye to follow the diffusion. If a porous body is placed between the vessels, the rate of diffusion can be measured. This fact is taken advantage of in the construction of the diffusimeter, invented by Thomas Graham. This consists essentially of a tube containing a gas, the lower and open end of the tube being dipped in mercury, while the upper end is closed with a porous plug. The rise of the mercury in the tube serves to measure the diffusion of the gas through the plug. Another method of testing diffusion is to fill a diffusion-tube with hydrogen and immerse the lower and open end in water, while the upper end is closed with the porous plug. Diffusion then takes place both ways, into the water and into the air.

Alcohol and water afford one of the readiest means of testing the diffusion of liquids. They will diffuse the same as gases, regardless of gravity. Stirring the two hastens the diffusion, because it brings a larger surface of one liquid against the other. At the same time the action is not a mixing in the ordinary sense, but a mixing of the molecules, forming a liquid that is of like proportions throughout when the diffusion is complete. If water in a glass vessel be colored with a few drops of litmus solution, and sulphuric acid be introduced through a tube to the bottom of the vessel, care being taken not

DIGAMMA — DIGESTANTS

to disturb the water, the diffusion may be observed visually. The water, which is blueed by the litmus, turns from blue to red as the diffusion of the sulphuric acid progresses. Some manufacturers of sugar have used the principle of diffusion for extracting cane-juice, and also for making an extract from beet-root. Hot water is applied to the cut cane, and diffusion withdraws a large part of the juice, securing the sugar. Surgeons have also utilized diffusion to cause a liquid to pass through a membrane or tissue of the body. It is the principle of diffusion of liquids that enables the druggist to compound the several items of a prescription. The uniform strength of his solutions and extracts is also largely dependent upon diffusion. If it were not for this, several fluids in a vessel would tend to arrange themselves in layers according to gravity, as is the case with water and oil, which do not diffuse together. Substances in solution also diffuse, following Fourier's law of the diffusion of heat. As the temperature rises the rate of diffusion increases. Since the rate of diffusion of different solutions and liquids varies, it becomes possible to separate component substances in solution, by taking advantage of the difference in rate of diffusion of each component. It has been demonstrated that some solids diffuse, though with extreme slowness. Lead placed upon gold for a period of years will be found to contain gold to a slight distance above the point of contact.

For a fuller understanding of the diffusion of gases, see KINETIC THEORY. Compare also OSMOSIS, which is, practically, diffusion taking place through a membrane.

Digam'ma, in the Greek language. In addition to the smooth and rough breathings, the ancient Greek language had another, which remained longest among the Æolians. This is most commonly called, from the appearance of the character used to denote it, which resembled our letter F, a *digamma*, that is, double F. It was a true consonant, and appears to have had the force of *f* or *v* or our *w*. It was attached to several words, which, in the more familiar dialect, had the smooth or rough breathing. Though the whole doctrine of the digamma is obscure, yet it is found in early Greek words, especially in Homer.

Digby, Sir Everard, English conspirator: b. 16 May 1578; d. 30 Jan. 1606. He enjoyed some consideration at the court of Elizabeth and James I., by whom he was knighted. Being gained over by Thomas Tresham to the extreme Catholic party, he was induced to give £1500 toward the expenses for the execution of the gunpowder plot. On the discovery of the conspiracy he was tried and hanged in 1606.

Digby, Sir Kenelm, English physical philosopher: b. Gothurst, Buckinghamshire, 11 July 1603; d. London 11 June 1665. His great-grandfather bore arms for Henry VII. on Bosworth field; his father, Sir Everard (q.v.) died on the scaffold as one of the leading Catholic gentry implicated in the gunpowder plot, 1606. Kenelm, then 3 years old, was educated as a Protestant, but at the age of 33 returned to the faith of his fathers. After completing his academic studies at Oxford he went on his travels through France, Spain, and Italy; in 1628 equipped at his own cost a squadron against the Algerine corsairs, and incidentally defeated a

Venetian force off Scanderoon. Returning home, 1638, he was thrown into prison as a royalist and not liberated till 1643, when he retired to France; there he was in high favor with the court and with men of learning and philosophers, among them Descartes. At the overthrow of the royalist cause he returned to England but was banished under pain of death by the Parliament. He then for a time served the French king in various embassies, but under the protectorate came back to England and was admitted to the intimate friendship of Cromwell. He was one of the founders of the London Royal Society. His works on physical philosophy, on natural science and on metaphysical subjects possess now only the interest of curiosity; among them are a 'Treatise on the Nature of Bodies,' 'Peripatetic Institutions,' 'Treatise on the Soul,' etc. On religious matters he wrote many books, among them 'A Conference About a Choice of Religion,' and 'Letters' on the same subject. His brief critique of Sir Thomas Browne's 'Religio Medici' gives a specimen of his style of argumentation. He was all his life an inquirer into occultism and wrote a book on 'The Cure of Wounds by the Power of Sympathy;' he hoped also to discover a means of conserving into old age the extraordinary personal beauty of his wife, and invented cosmetics to that end.

Digby, Kenelm Henry, English antiquarian; b. 1800; d. London 22 March 1880. He was graduated from Trinity College, Cambridge, in 1819, and in 1822 published 'The Broad Stone of Honor,' "that noble manual for gentlemen," as Julius Hare called it, "that volume which, had I a son, I would place in his hands, charging him to love it next to his Bible." It was much altered in the 1828 and subsequent editions (the latest 1877), its author having meanwhile become a Roman Catholic. Among his other works may be named 'Mores Catholici, or Ages of Faith' (1831-40).

Digby, William, English journalist and East India merchant: b. Wisbech, Cambridgeshire, 1 May 1849. Entering journalism he was successively engaged in newspaper work in England 1868-71; in Ceylon 1871-6; in Madras 1877-9; and again in England 1880-2. Since 1888 he has been an East India merchant in London. He has published: 'Forty Years' Citizen Life in Ceylon'; 'The Famine Campaign in Southern India' (1876-8); 'History of the Newspaper Press of India, Ceylon, and the Far East'; 'Indian Problems for English Consideration'; 'Nepal and India'; 'Condemned Unheard'; 'Indian Economics'; 'Prosperous British India' (1901); 'Natural Law in Terrestrial Phenomena'; etc.

Digby, Nova Scotia, on Saint Mary's Bay. A United States consular agent is stationed here. The town is noted for its curing of a variety of small herrings or pilchards. Pop. 1,150.

Di'gest. See CIVIL LAW.

Digest'ants, remedies that aid digestion, and which may include such agencies as exercise, sunlight, and pleasurable emotions, although the term is usually restricted to the drug agents that modify the secretions found in the stomach and intestines. The most important of these drug agencies that are employed for the

DIGESTER — DIGESTION

purpose of stimulating the appetite are the bitters, such as cinchona, columba, quassia, nux vomica; the carminatives, such as cinnamon, cloves, ginger, cardamom, capsicum, peppermint; alcoholic mixtures, such as the wines, brandy, whiskey, the cordials; the digestive ferments, such as diastase, pepsin, pancreatin; and the weak alkalies and weak hydrochloric acid.

Digester, a closed boiler in which a temperature above the boiling point can be obtained, the hot water and steam disintegrating or digesting the substance treated. The invention of the digester is credited to Denis Papin, a French scientist. He noted that anything boiled in an open vessel was not subjected to a heat above 212° F., as the water went off into steam at that temperature, and was lost. Accordingly he constructed a boiler with a closed top, to retain the steam, and succeeded in securing a temperature of 400° F., which served to readily digest bones. This digester came into use for the manufacture of soups and gelatines from bones that had been previously wasted or thrown to the dogs.

Within recent years the digester has found a place in a number of industries. The lard or grease tank of a slaughter-house is a digester. In some American cities digesters have been employed to receive garbage and secure a product of some value from the refuse. Tannin is extracted from nutgalls by a digester, in which the material is saturated with ether.

The digester has found its most extensive use, however, in paper-making. The wood, which is abraded by grinders from the log is introduced in a form resembling fine sawdust to the digester, and comes out pulped, ready to be rolled into paper. Sulphite digester is the common name for these mechanisms owing to the fact that a bisulphite solution is employed in the process of digesting. This serves as a solvent, but being acid it attacks the iron or steel of which the digester is constructed. To protect the iron shell various linings are employed. The "Non Antem" digester employs a lining made of a continuous sheet of lead placed against the inner sides of the shell, and held in place by two courses of acid-proof brick. The Mitscherlich digester is lined with acid-proof brick laid in Portland cement. The Graham digester is made of sheets of boiler plate, with the lead lining soldered on before bending. The Partington digester is made spherical, so that the lead lining tends to maintain its place from its form; the lead is also burned to the iron. Pusey & Jones build a digester of welded steel, with double shells and no lining. The Schenck digester is also unlined, being made of deoxidized bronze, and in both of these last-named the erosion is claimed to be very slight.

Most sulphite digesters are built in the form of an upright cylinder, with one or more man-holes at the top, through which the ground wood is introduced. Steam is admitted by coils, and a high temperature maintained for about eight hours. When properly cooked, the liquid is run off and the digested material withdrawn by manholes in the bottom.

Digestion, the change which food undergoes in order to prepare it for the nutrition of the animal frame. It is carried on in the higher animals in the digestive system. In some of the lowest forms of animal life (amœbæ) which

have no special organs, particles of food are drawn into the body and digested. In higher organisms there is a simple pouch which leads inward from the centre of the cluster of ten-

FIG. 1.—Section Through Mouth, Nose, etc.—a, sphenoid bone; b, Eustachian tube; c, soft palate; d, uvula; e, nasal passage; f, upper jaw; g, lower jaw; h, epiglottis; m, mouth.

tacles; into this fish and other food are drawn and digested, while the undigested parts are afterward voided through the same aperture by which they entered. In still higher organisms, man himself included, this simple pouch is changed into a complex and greatly elongated tube, which is provided with one aperture (the mouth) by which food enters, and another aperture (the anus) through which undigested matter leaves the body. The mouth in most animals is provided with hard tissues—teeth, beaks—for the subdivision of food before it is swallowed. Vegetable feeders, eating tough grains, roots, and fibres, have large molar or grinding teeth, while the carnivora have these same teeth modified so as to present a cutting edge, with which and their pointed canines meat is torn and cut into pieces, which are then swallowed. Below, the cavity of the mouth passes into the gullet or oesophagus, and in front of this tube runs the windpipe. Food will pass through the pharynx, or the interior of the throat, into the gullet; and air, during respiration, passes through the pharynx on into the larynx and windpipe; a valve called the epiglottis partly closes the aperture of the larynx.

The gullet or oesophagus is a long tube passing from the pharynx to the stomach. Its mucous coat is loaded with very large glands which secrete a quantity of very viscid mucus. The stomach itself is a greatly dilated part of the digestive system. It may be said to consist of two parts, even in the human subject; a more complex arrangement is found in many animals, such as the ruminants. The large dilated portion into which the gullet opens is termed cardiac, and the opening the cardiac or

DIGESTION

oesophageal opening. The mucous membrane, which,

FIG. 2.—Alimentary Canal.—a, oesophagus; b, stomach; c, cardiac orifice; d, pylorus; e, small intestine; f, biliary duct; g, pancreatic duct; h, ascending colon; i, transverse colon; j, descending colon; k, rectum.

abdominal walls. This membrane is called the peritoneum. The small intestine is somewhat arbitrarily divided into three portions—the upper (duodenum), the middle (jejunum), and the lower (ileum). The mucous coat contains glands very like the pyloric glands of the stomach, called Lieberkühn's follicles. They secrete the intestinal juice. In the duodenum one finds in addition highly branched glands called Brunner's. In both the mucous and sub-mucous coats, and generally involving both layers, are found masses of tissue—lymphoid—similar to that found in a lymphatic gland. Their function is probably connected with the blood and the blood corpuscles. Collections of these solitary glands, forming oblong patches about two inches long, are called Peyer's patches. In addition to the follicles of Lieberkühn and the glands of Brunner, there are the liver and the pancreas, which pour their digestive juices into the small intestine. The bile, which is the secretion of the liver, is formed continually by that organ, but the amount thus formed is influenced by the kind and quantity of food taken. The bile is to be looked upon not only as a digestive juice, but as a drain or channel of excretion, whereby effete and useless matter is removed from the body. The pancreas is very similar in structure to a salivary gland. It secretes the pancreatic juice which pours with the bile into the digestive system. The mucous membrane of the small intestine contains, in addition, little projections called villi. These are

whole is lined with in the empty stomach, is thrown into projecting folds or rugæ, but these folds are effaced when the organ is distended with food. In the membrane are innumerable glands which secrete the digestive juices of the stomach. The gastric juice is acid, and the chief acid secreted is hydrochloric acid. The substance called pepsin, which is necessary for digestion, is secreted by the whole of the glands.

The food now called the chyme passes into the small intestine, a tube about 20 feet long. This tube, besides the muscular and mucous coats, possesses an external coat of loose fibrous tissue covered by a single layer of flat cells. This coat is prolonged into and helps to form the mesentery, a membrane connecting the intestine with the

important absorbents. This property they share with the whole of the digestive system through any part of which, and especially through the walls of the stomach and small intestine, digested matter passes into the numerous blood capillaries which form everywhere a dense network. The villi are peculiar, for each one contains in addition to blood vessels a small lymph vessel or lacteal. Nearly all the fat absorbed by the digestive system is taken up by the little cells of the villi, and passes on into the lacteals and thence to the blood.

The unabsorbed food, mixed with the various secretions we have mentioned, now passes into the large intestine, where both digestion and absorption go on, though to a less extent. The large intestine is only five feet in length, but its girth is much greater than that of the small intestine. It commences with the cæcum, a dilated part, into which passes a little blind canal (the vermiform appendix) a large and important structure in some animals. The large intestine ascends on the right side (ascending colon), crosses over to the left side (transverse colon) and descends again (descending colon), and makes a bend (sigmoid flexure), and finally terminates in a somewhat enlarged portion (rectum). The mucous membrane of the large intestine differs from that of the small intestine in containing no villi or Brunner's glands. Lieberkühn's and solitary glands are present, but the aggregation of the latter into Peyer's patches is nowhere to be found.

When food is taken into the mouth it is at once swallowed, unless it is in a solid form. In this case it is chewed into a convenient size for swallowing, for which purpose it is, in addition, mixed with the viscid saliva and juices of the mouth. Many animals can hardly be said to masticate; such are the carnivora (dog, cat, etc.), and they are not provided with grinding teeth. In most animals living on vegetable food large flat grinding molars are found. In these animals, not only is the food finely divided in the mouth, but the food, largely consisting of starch, is partially digested by the saliva. During mastication the food would nat-

FIG. 3.—Section of the Stomach.—a, ducts of liver; b, pylorus; c, bile duct; d, pancreatic duct; e, cardiac orifice.

urally tend to escape from between the grinding surfaces of the teeth, and would collect within the mouth and outside the gums. This is prevented by the muscles placed in the substance of the cheeks and lips.

As a result of mastication, the food is gathered in the form of a round moist bolus on the upper surface of the tongue. It is now ready to be swallowed. In the first place, it is

DIGESTION

pushed backward by the tongue and seized by muscles, many of which are attached to the hyoid bone. According to the most recent investigation, the bolus is propelled with great rapidity through the pharynx and gullet into the stomach. Following the propulsion of the food downward there is a wave of contraction, which, commencing in the pharynx travels comparatively slowly downward through the gullet. It is seen then that swallowing is not due to the falling of liquids down the throat. A horse drinks "up-hill," and the jugglers, or indeed anyone can drink or swallow with the head vertically downward. When the food has reached the back of the mouth, swallowing occurs irrespective of the action of the will.

There is a possibility that during swallowing the food may go the wrong way—that is, it may pass into the larynx and windpipe. It is prevented from passing into it by the elevation of the larynx which pushes its aperture against

FIG. 4.—Digestive organs of Coleoptera.

and under the back of the tongue, which at the same time is pushed backward. In addition, there is a valve called the epiglottis, which is pushed down over the larynx by the movement just described and by muscular fibres which act upon it for that especial purpose. The walls of the stomach and intestines are, like the gullet, provided with muscular fibre. An external layer passes in the length of the gut, and within this is a circular layer. These muscles contract slowly on stimulation, and are outside the domain of voluntary action. During the digestion they contract peristaltically, urging the food toward the rectum. The peristaltic waves may begin in any part of the gut and pass slowly downward followed at varying intervals by

other waves. Probably what is called antiperistaltic waves may occasionally occur, tending to bring the food back toward the mouth, for bilious matter is frequently vomited, the bile having in all probability passed upward into the stomach by antiperistalsis from the duodenum.

Eruptions are frequently caused by antiperistalsis and by a movement of this kind food is brought back into the mouth for further chewing in the ruminants (sheep, oxen, etc.). The act of vomiting is a reflex nervous act. It can be excited by stimulating the branches of the vagus nerve, as when indigestible and irritative food is taken, or emetics are administered. By tickling the back of the throat with a feather, the glossopharyngeal nerve is stimulated and vomiting may readily be produced. It is of frequent occurrence in painful irritations of the uterine nerves in pregnancy, of the nerves of the liver and kidneys during the passage of a hepatic or renal stone, or indeed when irritation of any sensory nerves takes place. Cases in which irritating or poisonous substances are swallowed are so frequent that everyone should be aware that a large quantity of hot liquid, especially if it contains much salt or some mustard, forms a safe and speedy emetic. Ice is a valuable sedative, and often prevents vomiting.

In many animals, such as the sheep, ox, and camel, the stomach consists of several cavities communicating with one another. In the ox and sheep the cardiac and the pyloric portions are each subdivided into two compartments. The cardiac part consists of a very dilated cavity, the paunch (rumen), into which the food is passed as soon as swallowed. In addition there is a smaller part, the reticulum (honeycomb) so called from the folds of lining mucous membrane which intersects, forming a reticulum. The pyloric half is divided into two parts. The psalterium (maniples), so called from the lamellated appearance of its mucous membrane, communicates with the last division, the rennet stomach (abomasum). Fluid passes either into the first, second, or third part of the stomach, and thence on into the fourth. Solid matter, such as grass, roots, etc., passes either into the paunch or reticulum. This is mixed with the saliva swallowed with it and in addition it is mixed with juices formed by the mucous membrane of these cavities. When the animal has finished feeding, it lies down and rumination commences. Due in part to the contraction of the abdominal muscles and diaphragm, the food is propelled in the form of rounded pellets from the paunch and reticulum up into the mouth. The pellets are there thoroughly masticated, and are returned in a pulpy condition to the stomach. Now the food passes into the psalterium, and into the rennet stomach. Hence the consistency of the food determines into which part of the stomach it passes.

In the bird some interesting modifications in the structure of the alimentary canal are seen. The gullet at about the middle of its course is provided with a pouch or crop. Into this the food passes, and is bathed by a secretion formed by its glands. It is then propelled onward into a dilated cavity, the proventriculus, and is acted on by digestive juices. Thence it passes into the gizzard. This cavity is provided with muscular walls of enormous thickness in the case of birds that are vegetable feeders. It is lined by thick and corneous epithelium, and in

DIGESTION

its interior are generally found pieces of stone, chalk, etc. The gizzard is a powerful mill, which grinds the food into a soft pulp, upon which digestive juices can readily act. See BIRNS.

The most essential change which food undergoes in digestion is one of solution. Albumen, starch, fat, and other food-stuffs are insoluble in the circulating fluids of the body, and injected into the blood they would block up the smaller blood vessels. During digestion these pass either into nearly allied chemical substances which are readily dissolved in water, or in the case of fat partly into a soluble soap and partly into a state of microscopically minute subdivision. It is not sufficient, however, to have a soluble food-stuff in order that it may be absorbed and used by the body. Cane (table) sugar is soluble in water, but it is of no use as cane-sugar to the body. If injected into the blood vessels it is at once secreted by the kidneys. During digestion it is converted into another sugarless soluble, but in a form which can be used by the economy.

The digestion of food is brought about by the action of the saliva, the gastric, pancreatic, intestinal and other juices. These are mixed with the finely divided food by the movements of the alimentary canal. The digestive juices are in all cases secreted by the microscopic cells which line the various glands opening into the digestive system. The digestive ferments are not whole cells, they are the products of cells. They are not the broken-down, useless substances, such as carbonic acid, water, etc., which all cells give out, and which an animal like man excretes. They consist of a very complex active matter, of which we know almost nothing, and which we class with other substances of which we know little more, under the head albuminoids.

When food is passed into the stomach, secretion occurs. This, too, may result from mechanical irritation, as when through an opening (fistula) the mucous membrane is brushed with a feather. In all cases the stomach, pale before, becomes suffused with blood, and the gastric juice is poured out. The flow of the intestinal juice, the pancreatic juice, and bile all follow the stimulation of the mucous membrane, and in all cases the blood vessels enlarge so as to give the cells a good supply of food, though, as we have seen, they themselves actually pass into a condition of activity as a result of the influence of special secreting nerves. Foods belong to four classes: (1) Proteids—albumens, globulins, etc.; for example, the white of egg, the chief constituent of meat, the gluten of bread. (2) Carbohydrates—starches, sugars, gums; for example, potato-starch, cane- or grape-sugar. (3) Fats and oils; for example, suet, marrow, olive oil. (4) Minerals; for example, water, table salt, iron, phosphates.

Some few substances are absorbed without being digested at all; they do not need to be. Such are water and the minerals, though even many of these undergo some change. Grape-sugar is absorbed and probably proteids too are often absorbed to some extent at least. Fat is profoundly modified during digestion, though not as the result of any digesting ferment. The saliva, of which about 30 ounces are secreted during the 24 hours, contains a ferment termed ptyalin, which is capable of turning a starch into a soluble sugar called grape-sugar, or, ac-

cording to other observers, into another soluble sugar termed maltose. The ptyalin may be extracted from the saliva or from the salivary glands themselves. It does not appear to be much exhausted during its activity and has the general characters of unorganized ferments. The saliva is alkaline, and the starchy food is no doubt partly converted into sugar during its sojourn in the mouth and gullet by its action. When the food has reached the stomach and the acid gastric juice has mixed with it, the saliva is unable to act and is probably killed. Any digested starch is subsequently converted into sugar when the food reaches the small intestine by the pancreatic juice.

When the food reaches the stomach it causes a reflex secretion of gastric juice. This is but slowly produced when insipid heavy food, such as coagulated white of egg, boiled meat, sago, etc., is eaten, but flows readily when soups, broths, and fluids containing salts and extractions in abundance are taken. Thus we have a scientific reason for beginning a dinner with soup, preserving the *pièce de résistance* until the stomach has secreted gastric juice for its digestion. The gastric juice, several pounds of which are secreted daily, is acid in reaction containing free hydrochloric acid. Lactic and butyric acids form during the progress of digestion.

Within the stomach, and capable of being readily extracted from the stomach of a calf, is a ferment called the milk-coagulating ferment (rennet). This causes milk to coagulate and form a clot or curd. It subsequently contracts and squeezes out some fluid termed the whey. It is difficult to assign any use to this ferment, for the acid of the gastric juice would of itself cause the milk to curdle. Still more difficult is it to explain the existence of a similar ferment in the pancreatic juice, for we cannot suppose that any milk can even pass through the stomach to be subjected to its action. The milk, indeed, often forms dense clots which cannot afterward be digested, and which cause considerable gastric irritation. Milk is frequently found to disagree with some stomachs; but even in such cases it may often be sipped with impunity. In this case the formation of large clots is prevented. Lime water causes the milk to coagulate in small soft clots.

Within the small intestine most of the food undigested by the stomach (q.v.) is rendered fit for absorption. This takes place through the tissue of the mucous membrane; much of the sugar and peptones find their way into capillary blood vessels. Absorbed products and notably fat globules pass into the lacteals, and thence into the blood, circulating through the veins at the root of the neck. The contents of the lacteals during absorption are called chyle. The contents of the small intestine pass into the large intestine, where digestion occurs to a very slight extent. Absorption is, however, more rapid, and the contents become far more solid as they pass toward the rectum, due to the deprivation of water and soluble substances. The absorptive power of the large intestine is important to remember; for injections per rectum of liquid food, especially if it has already been artificially digested, may sustain life for long periods.

JOHN C. HEMMETER, M.D.,
Professor in Medical Department of the University of Maryland.

DIGGINGS — DIGITALIS

Diggings, a colloquial expression among miners in North America, Australia, South Africa, etc., the term designating the places from which gold is procured by means of surface excavations. Proceeding from the mining regions this appellation has become an everyday expression in referring to a region, locality, or place, as:

"She won't be taken with a cold chill when she realizes what is being done in these diggings?" Dickens, 'Martin Chuzzlewit.'

Diggs, Annie L., American author and librarian: b. London, Ontario, Canada, 1853. She was the first woman to lead a delegation at a national political convention, serving as chairman of the delegation from the District of Columbia, at the National People's Party Convention, Omaha, 1892. She is a temperance worker and political speaker, and president of the Kansas State Woman Suffrage Association, and she has been State librarian of Kansas since 1898. She is the author of 'Little Brown Brothers,' and many short stories.

Dighton Rock, a boulder of "greenstone" (in fact, bluish-gray), in Berkley, Bristol County, Mass., opposite Dighton, the landing-place for it; on the east shore of the Taunton River, about 10 feet from low-water mark, and covered two or three feet deep at each flood tide. It is 11½ feet long and about 5 feet high, with a flat face toward the river, once covered with inscribed characters varying from scratches to one third of an inch deep, not chiseled, but "pecked" in. For many years the stream of visitors, unchecked by any authority, have so often scrubbed off the tidal deposits of dirt with brooms and water to see the characters more plainly, that most of the latter are effaced and the whole past effective study. From old drawings, however, and comparison with similar petroglyphs elsewhere, there is no doubt it is Indian; Schoolcraft says, in the symbolic character of the Kekeewin. (See Garrick Mallery in annual report of the Bureau of Ethnology, 1888-9, pp. 85-6, 762-4; from Dr. Hoffman's examination of 1886.) Enthusiasts at various times have made wonderful interpretations of it. Rafn of Copenhagen found the name of Thorfinn on the drawing sent him (see his correspondence with the Rhode Island Historical Society 1830-4, in 'Antiquitates Americanae,' Copenhagen, 1837), and thought it a record of the Vinland settlement; an Orientalist deciphered "melek" (king), and considered it Phœnician, and another believed it Scythian. Many drawings have been made of it since the first by Samuel Danforth in 1680, and a second by Cotton Mather in 1712; for which, and a picture of the rock *in situ*, see Rafn as above, and for the drawings, the report above cited.

Digit, in arithmetic, usually signifies any one of the 10 numerals, 1, 2, 3, 4, 5, 6, 7, 8, 9, 0, though zero is sometimes not regarded as a digit. The word comes from *digitus*, a finger; thus indicating the humble means originally employed in computations. Digit is also a measure of a finger's breadth equal to three fourths of an inch.

Digit, in astronomy, is the measure by which we estimate the quantity of an eclipse. The diameter of the sun or moon's disk is conceived to be divided into 12 equal parts, called digits;

and according to the number of those parts or digits which are obscured, so many digits are said to be eclipsed. When the luminary is wholly covered, the digits eclipsed are precisely 12; and when it is more than covered, as is frequently the case in lunar eclipses, then more than 12 digits are said to be eclipsed.

Digitalin, dij'-ta-lin, various substances obtained from the leaves and seeds of the common foxglove (*Digitalis purpurea*), some of them being deadly poisons, but of great medicinal value, while others are almost inactive or harmless. Of these the earliest extracted was Homolle's digitalin, prepared from the leaves by the action of alcohol, ether, and lead oxide. It is a white, bitter, partially crystalline body without smell, soluble in alcohol, but not in water or ether, and has been used in medicine. Another digitalin was obtained by Walz by treating that of Homolle with ether and water; it is yellow, amorphous, soluble in water, and very powerful in its action. Another chemist, Nativelle, obtained from the leaves two crystalline bodies, known as digitalin and digitin, and an amorphous one called digitalein. Digitalin, prepared by various processes, and probably not chemically pure, is employed in medicine, being useful in stimulating the action of a weak heart, and effective also in removing dropsical fluid by its action on the kidneys; but it is apt to derange the stomach and bowels, cause loss of appetite, etc.

Digitalis, dij'-tā-lis, a name given to the leaves of the plant *Digitalis purpurea* (see FOXGLOVE), of the second year's growth. This is a biennial herb which is largely cultivated for ornament. It is about two to five feet high, with large succulent leaves and tubular urn-shaped purple flowers growing in a raceme. It is a native of southern and central Europe, and is extensively cultivated throughout the world, although the cultivated leaves are not as serviceable as those of the wild plant. The leaves, which lose on drying about 75 per cent in weight, are mostly obtained from the wild plants growing in the mountainous regions when two thirds of the flowers are expanded. The leaves should not be kept more than one year, as the quality deteriorates very rapidly. The active principles in the digitalis leaves consist of four or five glycosides: digitoxin, digitophyllin, digitalin, digitalein, and digitonin. The seeds also contain large amounts of active glycosides. The action of digitalis on the body is complex. It is primarily a local irritant causing secondary paralysis of the sensory nerve-endings. It is bitter to the taste, followed by burning and swelling of the mucous membrane. It is an irritant to the intestines, where it may cause nausea and vomiting. After absorption the chief action of the drug is on the central nervous system, the heart, and the blood vessels. The action on the nervous system is of secondary value to the heart activities, although there is distinct stimulation throughout. The action of the drug on the heart-muscle is the most important property possessed by digitalis, both pharmacologically and therapeutically. Here, by reason of the complicated physiology of the heart action, the differing effects of digitalis on this organ are somewhat difficult to comprehend. Digitalis stimulates primarily the muscular fibres of the heart. It stimulates the cardiac nervous gang-

lia; and it stimulates, and then paralyzes, the cardiac inhibitory nerve, the pneumogastric. Thus the normal heart, under the action of small doses of digitalis, is at first made to beat somewhat more strongly and rapidly; but as soon as its action upon the pneumogastric becomes manifest, in larger and increasing doses, the heart action becomes more powerful and is somewhat slowed; and in full medicinal doses, frequently used in medicine when the effects of digitalis are desired, the action of the heart is much stronger and considerably slowed. The blood-pressure is high, and the arteries are contracted. If, however, the use of digitalis is pushed beyond this point, its action as a paralyzant of the pneumogastric begins to be evident. By reason of this loss of the inhibitory action of the pneumogastric, the heart action at first is stronger, and the beat becomes more rapid. If still further toxic doses are given, the heart runs away, as it were. It beats very rapidly, irregularly, and with increasingly weakened force, until it finally stops exhausted. Digitalis also increases the secretion of urine; it raises the pressure of the blood vessels, and increases the amount of blood in all the organs of the body, including the heart itself. It is thus one of the great cardiac tonics, when used within physiological limits, and is indicated in most cases of heart disease where there is malnutrition caused by the dilatation of the chamber or a leakage of the valves.

Digitaria, a genus of grasses, commonly called finger-grasses, now classed under the genus *Panicum*. See FINGER-GRASS.

Digitigra'da, a group of mammals in the obsolete system of Cuvier, comprising those like the dogs, cats, civets, weasels, rodents, etc., which have the metacarpals and metatarsals greatly lengthened, and the foot otherwise modified, so as to lift the heel off the ground. The animal consequently walks upon its toes (digits), an adaptation to the requirements of captivity and speed. This form of foot appears very early in the history of the mammalian class, but has reached its highest development in more modern forms. The opposite condition, in which the whole sole of the foot rests upon the ground, as in bears, man, and others, is called "plantigrade"; but some animals, as those of the raccoon family, are intermediate between plantigrade and digitigrade in their method of standing and walking. The term no longer expresses a scientific classification.

Dijon, dē-zhōn (ancient DIBIO), France, chief town in the department of Côte-d'Or, and formerly capital of the old duchy of Burgundy. It is 196 miles southeast of Paris. Its importance as a railway centre has rendered it of consequence in the inner line of French defenses. Pop. (1901) 70,428.

Dika, dē'ka, a vegetable fat obtained from the seed of a West African tree, *Irvingia barteri*, used in making fine soaps. It resembles cacao-butter, and makes very hard soaps. The tree belongs to the *Simarubaceæ*, and has alternate, entire leaves and drupaceous fruits.

Dikamali, dik-a-māl'i, a resin exuding from Indian trees of the genus *Gardenia*, especially *G. lucida* and *G. gummifera*, a solution of which is used to dress wounds and open sores. These trees belong to the order *Cinchonaceæ*.

Dike, Samuel Warren, American reformer: b. Thompson, Conn., 13 Feb. 1839. He was graduated from Williams College in 1863; and from Andover Theological Seminary in 1866. He was subsequently ordained as a Congregational minister. He was the founder of the Divorce Reform League, now known as the National League for the Protection of the Family, and has been its corresponding secretary from the first. He also established the home department of the Sunday School. He has written numerous papers for periodicals on marriage, divorce, the family, etc.

Dike, in Grecian mythology, the avenger of wrong, and the rewarder of virtue. She is the daughter of Zeus and Themis, and is considered one of the Horæ.

Dike, or **Dyke**, a word variously used to represent a ditch or trench, and also an embankment, rampart, or wall. It is specially applied to an embankment raised to oppose the incursions of the sea or of a river, the dikes of Holland being notable examples of works of this kind. Owing to the possibility of great loss of property and of life, the punishment of all neglect or for malicious mischief to dikes is extremely severe. The dikes which protect the Netherlands and the German coasts of the North Sea go back to the old Roman times. Apparently even before the Romans appeared the Batavians at the mouth of the Rhine protected themselves by dikes. Drusus after the conquest of Holland, 10 B.C., built an elaborate system of artificial canals and dikes. Pliny the Elder gives interesting descriptions of the artificial hills which were erected as places of refuge during the floods.

Among the provinces in North and South Holland which have been protected by dikes may be mentioned the Province of Hanover, 618 miles, protecting 770,000 acres of marsh land. On the left bank of the Oder River there is a dike which protects more than 170,000 acres of land. The dike at the delta of the Vistula protects 134,000 acres of land. On the Lower Rhine, between the Weser and Holland are 115,000 acres protected by dikes. Along the Loire River are 280 miles protecting 230,000 acres. Along the Po there are 310 miles protecting 850,000 acres. In England there are 1,750,000 acres protected by dikes. Many of the dikes of Holland are raised 40 feet above high-water mark and are wide enough at the top for a general roadway or canal, sometimes for both.

In the United States the term dike is almost wholly restricted to the structures of more or less permanence built in various ways in the bed of a stream to regulate its flow, narrow the low water cross section, concentrate the current, increase its local scouring effect and thereby deepen the river channel. The earthen embankments designed to restrain the flood waters are called levees. The most notable examples are found along the Mississippi River. These levees are placed some little distance back from the river, and according to the local conditions vary in height from 2 or 3 feet to over 20 feet. Levee building began many years ago along the lower part of the river and it has been carried on practically continuously ever since. Up to June 1900 the United States had

expended more than \$15,000,000, and the various levee boards had expended between 1882 and 1900 more than \$22,000,000. The length of the levee lines along the Mississippi River in 1900 was about 1,300 miles, and the area protected from overflow about 27,000 square miles. In the existing levees there were about 140,000,000 cubic yards of earth, and to complete the system and make the levees safe against the maximum possible flood would require about 120,000,000 cubic yards in addition, which it was estimated would cost about \$20,000,000. See RESERVOIRS.

Dike. In geology, a dike is any elongated and relatively narrow body of igneous rock that was forced while molten into a fissure and hardened there. The rocks cut by the fissure may be either sedimentary or igneous, and a dike may be from a few inches to a hundred feet thick. Dike rocks, especially in thin dikes, have usually a compact texture due to the quick cooling. Quartz, porphyry, and basalt are the commonest dike rocks. Dikes are to be distinguished from veins which are fissures filled with minerals (quartz, calcite, etc.) deposited from solution; but some dikes of rocks containing much silica were deposited from igneous solutions containing the vapor of water, hydrochloric acid, etc., and such dikes may grade insensibly into true quartz veins. Dikes are of common occurrence in all regions of volcanic action and in mountain ranges, and as all manner of chemical changes may take place along the contact of a dike with the rock it cuts, dikes are often of importance in determining ore deposits. A well-known example is the relation of the iron ore bodies in many of the great mines of the Lake Superior region to the diabase dikes. So called sandstone dikes, found in California and elsewhere, represent fissures that have been filled in some way with sand. They are not true dikes. See DIABASE; ORE DEPOSITS; QUARTZ; PORPHYRY; VOLCANO.

Dikoa, dē-kō'a, Africa, a town in the northwestern part of Kamerun, about 25 miles south of Lake Chad. It is fortified and was at one time the residence of the ruler of the native kingdom of Bornu. Pop. 15,000 to 25,000.

Dilatation. See HEART-DISEASE.

Dilem'ma (from Gr. *dis*, twice, and *lēmma*, an assumption), in logic, an argument in which the same conclusion may be drawn from two contrary propositions. A person is said to be in a dilemma, or on "the horns of a dilemma," when each of several courses of action would lead to an unsatisfactory result. We append one of the most famous of the classical dilemmas. A young rhetorician said to an old Sophist: "Instruct me in pleading and I shall pay you when I gain a cause." The master sued for the reward, and the scholar eluded the claim by a dilemma. "If I gain my cause I shall not pay you, because the award of the judge shall be against you. If I lose it I may withhold it, as I shall not have gained a cause." The master replied: "If you gain you must pay me, because you promised to pay me when you gained a cause; if you lose you must pay me, because the judge will award it." When the case came before the judges they were unable to decide it. See LOGIC; PARADOX; SYLLOGISM.

Dilettante, dī-lēt-tān'tā, an Italian expression; in its original sense signifying a lover of the arts and sciences, who devotes his leisure to them as a means of amusement and gratification. The term was originally applied to a lover of Italian vocal music, and was at one time the name of a party which upheld the superiority of that class of music. In contemporary usage the word has come to mean more or less of an artistic trifler. In 1734 a number of gentlemen founded a Dilettanti Society in London, with the object of combining social intercourse with the cultivation of artistic knowledge. On the rapid accumulation of the funds, the members resolved, in 1764, to send out an expedition to collect details and drawings of the most remarkable artistic monuments of antiquity. Messrs. Chandler, Revett, Stewart, and Pars accordingly were sent to Asia Minor, and returned with the materials for the splendid work on *Ionian Antiquities*, published at the expense of the society, the first volume of which was issued in 1769; a second volume was published in 1797, and a third in 1840. Among other works published by the society are: 'Specimens of Ancient Sculpture, Egyptian, Etruscan, Greek, and Roman' (two vols. imp. folio; London 1809, 1835); the 'Unedited Antiquities of Attica' (imp. folio; London 1817); the 'Temples of Ægina and Bassæ' by C. R. Cockerell (folio; London 1860).

Diligence, the name originally given in French-speaking countries to a public conveyance of the nature of a stage-coach. The name was also adopted by other countries for their public carriages. The French diligence was a national vehicle going over regular routes periodically. It was a huge, heavy, cumbersome affair, upon four broad wheels which never covered a greater distance than six miles an hour. It had three compartments designed for the same number of classed passengers. Two officials accompanied the diligence on its trip; a *postillon*, who managed the horses, and a *conducteur*, who looked after the passengers and their traps.

Dilke, SIR CHARLES WENTWORTH, English politician: b. London 18 Feb. 1810; d. St. Petersburg, Russia, 10 May 1869. He was the son of C. W. Dilke (q.v.). One of the most active originators, as well as member of the executive committee of the Great Exhibition of 1851, he was sent in 1851 as a commissioner to the New York Industrial Exhibition, and in 1862 was one of the five royal commissioners for the second exhibition. In 1865 he was returned to Parliament for Wallingford, and in 1869 was sent to Russia as the representative of England, to the horticultural exhibition held at St. Petersburg. He was knighted in 1862.

Dilke, SIR CHARLES WENTWORTH, English writer and politician: b. Chelsea 4 Sept. 1843. He is a son of the preceding; was educated at Trinity Hall, Cambridge, and was shortly afterward called to the bar. His first work, 'Greater Britain,' the result of a tour round the world in 1866-7, became very popular. In 1868 he was elected M.P. for Chelsea, and he represented this constituency up to 1885. From 1880 till 1882 he was under-secretary for foreign affairs, and from 1882 till 1885 president of the local government board. After a few years'

retirement he became M.P. for Forest of Dean division of Gloucestershire in 1892. Sir Charles has played a not unimportant part in connection with various legislative measures. 'The Present Position of European Politics' (1887); 'The British Army' (1888); 'Problems of Greater Britain' (1890); and 'Imperial Defense' (with Spencer Wilkinson, 1891); 'British Empire' (1898); are among his works.

Dilke, Emilia Frances Strong, Lady, English art critic: b. Ilfracombe 2 Sept. 1840. She was married to Mark Pattison in 1862 and to Sir C. W. Dilke (q.v.) in 1885. She was for many years a writer for the 'Saturday' and 'Westminster' reviews, and at one time art critic of the 'Academy.' Her chief work is 'The Renaissance in France' (1879), illustrated by herself. Her other publications include: 'The Shrine of Death' (1886); 'Art in the Modern State' (1888); 'The Shrine of Love and Other Stories' (1891); 'French Painters of the 18th Century' (1899); 'French Architects and Sculptors of the 18th Century' (1900); 'French Decoration and Furniture in the 18th Century' (1901).

Dill, James B., American corporation lawyer: b. about 1855. He was graduated at Yale in 1876, and from the law school of the University of the City of New York 1878. He has drafted, in whole or in part, the charters of more than 700 corporations and has written various monographs on matters connected with corporation law, among them: 'The Advantages of Business Corporations,' which has been very widely circulated. It was at his suggestion that New Jersey adopted the Corporation Registration Law, which gave New Jersey corporations the same protection afforded by the English system. See CORPORATIONS.

Dill (*Anethum graveolens*), the common name for an aromatic plant of the carrot family (*Umbelliferae*). It is a native of Spain, but has been naturalized throughout the civilized world, where the climate is suitable for its growth. It is a particular favorite with the German people, who use it to flavor cucumber pickles, and therefore try to raise it wherever they may be living. In England it is used for the manufacture of gin, and to a small extent in medicine, as a carminative for children. An East Indian species is one of the ingredients in curry powder. It is a hardy biennial plant, growing upright. It has a single slender stem, and leaves finely divided or pinnatifid. The flowers, which form an umbel, appear in June or July. The seed is of an oval form, convex on one side, flat on the other, having three striæ on the outside, and surrounded with a small membranous border. Its taste is slightly acrid, and its odor stronger but less pleasant than that of fennel, to which it is closely allied. In America, where found out of gardens, it is a fugitive from cultivation, and is generally called fennel.

Dilleniaceæ, dil-lē-nī ā'sē-ē, an order of plants nearly related to the *Ranunculaceæ*, found chiefly in Australia, Asia, and the warm parts of America. Sepals five, persistent; petals five, deciduous, in a single row; seeds universally arillate; stamens indefinite, hypogenous. The species are trees, shrubs, or under-shrubs. The Indian species are remarkable for their beauty,

the grandeur of their foliage, and the magnificence of their flowers. They have astringent properties, and some of the species afford excellent timber. Lindley enumerated 26 genera, comprising 200 species.

Dillenius, dil-lā-nē-oos, or **Dillen, Johann Jakob**, yō'hān yā'kōb, German botanist: b. Darmstadt 1687; d. Oxford, England, 2 April 1747. He was distinguished for his investigations into the propagation of plants, particularly cryptogamous plants. In 1721 he went to England, where he published several works, and particularly 'Hortus Elthamensis' (1732), in which the drawings, prepared by himself, are distinguished by the greatest faithfulness. His last work, on the mosses, 'Historia Muscorum,' added much to his reputation.

Dillingham, William Paul, American statesman: b. Waterbury, Vt., 12 Dec. 1843. He studied law, was admitted to practice in 1867, and was state attorney, Washington County, Vt., 1872-6. He was a member of the Vermont legislature 1876 and 1884; state senator 1878 and 1880; commissioner of State taxes 1882-8, and governor of Vermont 1888-90. Since 1890 he has been president of the Waterbury National Bank. He was elected United States senator in October 1900 to fill a vacancy caused by the death of Justin S. Morrill.

Dillmann, dil'mān, Christian Friedrich August, German Orientalist: b. Illigen, Württemberg, 25 April 1823; d. 4 July 1894. In 1854 he accepted a call to Kiel, where he became professor of Oriental languages in 1860, but was transferred in 1864 to the chair of Old Testament exegesis at Giessen, which in 1869 he resigned to become Hengstenberg's successor at Berlin. Dillmann was beyond question the first authority in Europe on the Ethiopic languages. The best books for the student in this department of learning are his: 'Ethiopian Grammar' (1857); 'Ethiopian Dictionary' (1865); and his 'Ethiopian Selections' (1866). Other works (1879-84) deal with the history of the Ethiopic kingdom of Axum.

Dillon, John, Irish politician, son of John Blake Dillon, who was a prominent member of the Young Ireland party, and member of the British Parliament for County Tipperary in 1865-6; b. New York 1851. He early identified himself with the Parnellite movement, and in 1880 was elected to Parliament for County Tipperary. In the House of Commons Dillon soon became prominent for the violence of his language, while speeches delivered by him in Ireland led to his imprisonment in 1881, 1881-2, and 1888. From 1883 to 1885 he was absent from political life on account of ill-health; but in the latter year he reappeared and was elected for East Mayo. He was one of the most prominent promoters of the 'Plan of Campaign.' In 1896 he succeeded Justin M'Carthy as chairman of the main section of the Nationalist Party.

Dillon, John Forrest, American lawyer: b. Montgomery County, N. Y., 25 Dec. 1831. Going to Iowa in early youth, he was graduated at the medical department of Iowa University, but soon gave up medical practice and studied law, being admitted to the bar in 1852. He was State prosecuting attorney 1852-8; judge of the supreme court of Iowa 1863-9; and judge of the United States circuit court, 8th judicial

district, 1869-79, when he resigned. From 1879-82 he was professor of real estate and equity jurisprudence in Columbia Law School, and has since then practised law in New York, being general counsel of the Missouri Pacific Railway Company; and the Western Union Telegraph Company; and consulting counsel of the Manhattan Elevated and Pacific Railway companies. Among his works are: 'United States Circuit Court Reports'; 'Municipal Corporations'; 'Removal of Causes from State to Federal Courts'; 'Municipal Bonds'; and 'Laws and Jurisprudence of England and America.'

Dilman, dēl'mān, Persia, city in the province of Azerbaijan, 75 miles west of Tabreez. It is of considerable extent, and is surrounded by gardens. Pop. estimated at 10,000.

Dilolo (dē-lō'lō) **Lake**, a small body of water in Central Africa, discovered by Dr. Livingstone (1854). Its altitude is nearly 5,000 feet above the sea. It is supposed to be connected with both the Zambesi and Congo rivers.

Diluents, remedies that increase the proportion of fluid in the blood. They are employed in fevers to lessen thirst and increase secretion, and are used in certain acrid affections of the stomach and intestinal regions. Water is the only real diluent, though it may be given in various forms—soups, barley-water, toast-water, milk, lemonade.

Diluvium, a term first used by the English geologist Buckland in 1823, and applied by him to the deposits between the Tertiary system and those now in process of formation. He regarded them as the discharge from a universal flood. The diluvium thus includes the boulders, sands, and clays which Lyell included under the name Pleistocene and Morlot under the name Quaternary. Though the term diluvium is no longer used, the adjective diluvial is still employed, especially by foreign geologists. See GLACIAL PERIOD; PLEISTOCENE; QUATERNARY.

Dime (Fr. *dîme*, contraction of *denier*), a silver coin of the United States, of the value of 10 cents, or one tenth of a dollar. It was first coined in 1796 in pursuance of the act of 2 April 1792, though pattern pieces were struck in 1792. Its legal standards have been as follows: by act of 2 April 1792 fineness 892.4 thousandths, weight 41.6 grains; by act of 18 Jan. 1837 fineness 900 thousandths, weight 41¼ grains; by act of 21 Feb. 1853 fineness 900 thousandths, weight 38.4 grains. See COIN; NUMISMATICS.

Dimensions, a term used in physics in expressing the mode of dependence of a secondary unit upon the fundamental units from which it is derived. Thus the volume of a rectangular solid is found by multiplying the length by the breadth, and this product again by the thickness; or, in other words, by forming a product that is composed of three factors, each of which is a length. This is expressed, in the terminology of modern physics, by saying that volume (or "bulk") is of the "dimensions" L^3 ; or that it is of dimensions $+3$ in length. Similarly, the speed with which a body is moving is found by dividing some particular distance that is traversed by the body, by the time that is required to traverse it. The "dimensions" of speed are therefore said to be LT^{-1} ; or speed is said to be of dimensions $+1$ in length, and -1 in time.

Three fundamental units are required in order to express the ordinary units of mechanics in this way. Some latitude is possible in their selection, but most writers adopt (1) a definite mass, (2) a definite length, and (3) a definite interval of time. An example of a mechanical unit that contains all three of these units is afforded by energy. The kinetic energy of a body is found by multiplying a mass by the square of a velocity; and hence the dimensions of energy are expressed by the formula ML^2T^{-2} , so that energy is of the dimensions $+1$ in mass, $+2$ in length, and -2 in time. As an example of the determination of the dimensions of a quantity by indirect means, force may be considered. Work is defined as the product of force and distance; so that it may be written FL . Now energy, since it is capable of becoming transformed into work, must be of the same dimensions as work; and hence we must have $FL = ML^2T^{-2}$, from which it is easily seen that $F = MLT^{-2}$. In other words, force is of dimensions $+1$ in mass, $+1$ in length, and -2 in time. The correctness of this result is easily verified by direct calculation. Thus momentum, being the product of a mass by a velocity, is of the dimensions MLT^{-1} ; and since force is measured by the increase of momentum that it can produce in a given time (or, in other words, force is determined by dividing a given change of momentum by the time required to produce that change), the dimensions of force must be $MLT^{-1} \div T = MLT^{-2}$, which is identical with the result previously obtained. The theory of dimensions is of great importance in connection with problems involving a change of the fundamental units from one system to another; as, for example, in translating the values of physical quantities that have been determined in the metric system, into their equivalents as expressed in the system of units in use in England and the United States. For these important applications, and for the extension of the fundamental principles to the discussion of problems in electricity and magnetism, consult J. D. Everett, 'Units and Physical Constants.' See UNITS.

Dimet'rodon, a primitive reptile of the Permian period in which the neural spines of the vertebræ are greatly elongated, making a high rigid fin on the back. The teeth indicate carnivorous type habits, and the animal appears to have been terrestrial or amphibious. In the allied *Naosaurus* a series of short cross-spines project on each side from the neural spine, like the yards of a ship from the masts. The use of this very curious structure is quite unknown. The animal attained a length of 10 or 12 feet.

Dimin'utive, in grammar (from the Latin *diminutivum*), an affix, which conveys the idea of littleness, and all other ideas connected with this, as tenderness, affection, contempt, etc. The opposite of diminutive is augmentative. In Latin, diminutives almost always ended in *lus*, *la*, or *lum*; as *Tulliola*, *meum corculum*, little Tullia, my dear or little heart.

The Italian is particularly rich in diminutives and augmentatives: *ino*, *etto*, *ello*, convey the idea of smallness, dearness, etc.; *one*, of largeness; *uccio*, sometimes of smallness, with reproach, but often without it; *accio* signifies that the thing is disgusting, unpleasing, etc.; for

DIMITRY — DINAPAC ROCKS

example, *casa* is a house; *casetta*, *casina*, *casella*, a small house, nice little house; *casone*, a large house; *casuccia*, a small, insignificant house; *casaccia*, an ugly house. That expressive tongue can compound two or three of these endearing affixes; and travelers may frequently hear little Italian children form almost endless words, as if overflowing with tenderness; for instance, *fratellinucciettinetto*. Adjectives also can receive the diminutive termination; as *carino*, *carinuccio*, from *caro*. In Spanish there are similar diminutives, augmentatives, and other affixes. Thus from *hombre*, a man, are formed the augmentatives *hombro*, *hombrazo*, *hombronzazo*, *hombrachon*; and from *muger*, a woman, *mugeron*, *mugeraza*, *mugeronaza*. Diminutives in *ito* and *ico* usually denote endearment or tenderness, as those in *illo* do sometimes; those in *elo* always denote contempt. In Portuguese the diminutives and augmentatives correspond to those of the Spanish language. In French there are many diminutives formed from other words; as, *tablette*, of *table*, *charette* of *char*; but there is no general affix which can be added to every substantive. The German has the syllables *chen* (in Low German, *ken*, with which corresponds the English *kin*, as in *manikin*, and some other words), *lein* and *el*, for substantives; *lich*, etc., for adjectives; *lich* corresponds to the English *ish* or *like*; for instance, *rundlich*, roundish or roundlike (from *rund*, round). The German even adds the diminutive to pronouns, and nurses will sometimes say *duchen*, from *du*, thou.

The English language affords examples of diminutives, but has no affix which can be used at pleasure to convey this idea. Those commonly used are *ock*, *kin*, *el*, *ling*, and *et*; as in *bullock*, *lambkin*, *kernel*, *gosling*, and *tablet*. Diminutives of proper names are also formed, in colloquial and familiar language, by adding *y* or *ie* to the names, as *Charley*, *Johanny*, etc.

Dimitry, Charles Patton, American novelist: b. Washington 31 July 1837. He was educated at Georgetown College, and after serving as a private in the Confederate army, was connected with newspapers in several cities of the North and South. He is State historian of the Louisiana Society of the American Revolution. Among his works are: 'Guilty or not Guilty'; 'Angela's Christmas'; 'Gold Dust and Diamonds'; 'The House in Balfour Street'; 'Louisiana Families'; 'Louisiana Story in Little Chapters.'

Dimitry, John Bull Smith, American author and editor: b. Washington, D. C., 27 Dec. 1835; d. New Orleans 7 Sept. 1901. He entered the Confederate army of Tennessee in 1861, serving till 1864, being wounded at the battle of Shiloh. He resided in the United States of Colombia 1874-6, filling the position of professor of languages in the Colegio Caldas, Barranquilla. He was long connected with the press, being for seven years dramatic and literary editor of the New Orleans *Times*, and wrote a 'History and Geography of Louisiana,' which has been used as a text-book.

Dimity (Gr. *dí-* double, *mitos*, thread; literally, made with a double thread), a stout cotton fabric, ornamented in the loom either by raised stripes or fancy figures; stripes are the most common, as the mounting of the loom is much simpler and the texture can be produced at

less expense. It is rarely dyed, but usually employed white, as for bed and bed-room furniture. There is also a much finer cotton stuff on the market to-day which is manufactured for summer-dress material.

Dimmesdale, *dimz'däl*, **Arthur**, the erring clergyman in Nathaniel Hawthorne's tale, 'The Scarlet Letter' (q.v.).

Dimor'phism (from the Gr. *dimorphos*, of double form), in crystallography, the crystallization of a body in forms belonging to two different systems, or in incompatible forms of the same system. In biology, the occurrence of individuals of the same species in such a form, that, were not their relation known, they might be considered as separate and distinct in species and even in genera. Thus, in sexual dimorphism, the male and female of the same species present distinct characters, the male may be winged, the female wingless.

Dimor'phodon, a genus of Lias bird-like reptiles, found in the south of England. The large head has powerful jaws, with large anterior teeth which are pointed, and small posterior teeth which are lancet-shaped. This is the earliest of the reptiles that were capable of flight. See PTERODACTYL.

Dimsdale, **Thomas**, English physician: b. Essex 6 May 1712; d. Hertford 30 Dec. 1800. He published: 'The Present Method of Inoculation for the Smallpox' (1767). He was famous as an inoculator, making journeys in 1768 and 1784 to Russia to inoculate the Empress Catharine and other magnates.

Dinah Morris, the heroine of George Eliot's novel, 'Adam Bede' (q.v.). She is a factory girl and at the same time a lay preacher whose purity, spirituality, strength, and tenderness have an uplifting influence on all who come in contact with her. The beauty of her character is especially developed in her intercourse with the guilty and condemned Hetty Sorrel (q.v.). Elizabeth Evans, an aunt of George Eliot, appears to have been the original from whom the character was drawn.

Dinajpur, *dē'nāj-poor*, or **Dinagapore**, India (1) A district in the Rajshahi division. Area 4,118 square miles; pop. 1,555,835. (2) A city and capital of the district, 205 miles north of Calcutta. Pop. 12,204.

Dinan, *dē-nān* (ancient DINNANUM, fortress on the water), a town in the department of Côtes-du-Nord, France, 16 miles south of St. Malo. It is noted more for its trade than for its manufactures. Pop. 10,000.

Dinant, *dē-nān* or *dē-nānt'*, Belgium, a town in the province of Namur, on the Meuse, 14 miles south of the city of Namur. It was fortified as early as the 12th century. In 1466 Philip the Good, Duke of Burgundy, besieged it with 50,000 men; and having taken it by assault, razed it to the ground, and threw 800 of its inhabitants, tied in pairs, back to back, into the Meuse. Paper-mills, tanneries, breweries, and bake-shops are the chief industries. It is noted for its gingerbread made of rye flour and honey. Pop. 7,208.

Dinapac, *dē-nā-pāk'*, or **Guinapak, Rocks**, Philippines, two tower-like rocks, lying east of Camiguin Island, north of Luzon. On 2 Nov. 1899, the United States ship *Charleston* struck an uncharted coral reef three miles north of

Dinapac Rocks and was totally wrecked. All signs of the wreck disappeared in a heavy typhoon a few weeks later.

Dinapur, dē'nā-poor, India, a city in the district of Patna, on the Ganges, about 12 miles northwest of Patna. It is one of the great stations of the British army in India. Pop. 44,419.

Dinar, dē-nār' or dī'nēr (Lat. *denarius*), formerly an Arab gold piece weighing about 65.4 grains troy. Also a Persian coin. It is now the name of the chief Persian coin, value one franc.

Dinar'chus, Greek orator: b. Corinth 361 B.C.; d. Athens 291 B.C. He studied under Theophrastus, and was most successful during the reign of Demetrius Phalereus. After the fall of Demetrius he fled to Chalkis, and returned to Athens in 292 B.C. Of his speeches, of which there were probably about 60, only three are preserved, one of them directed against Demosthenes.

Dinar'ic Alps, the name applied to the mountains connecting the Julian Alps with the Balkan system. The main range stretches from northwest to southeast, separating Dalmatia from Bosnia and Herzegovina, as far as the mouth of the Narenta. The mountains are principally calcareous; the highest summits are Orjen 6,225 feet, and Dinara 5,940 feet.

Dinas Bricks are highly valued on account of their refractoriness or infusibility. They are made of a peculiar rock, containing 98 per cent of silica, with a little alumina, which occurs at Dinas in the vale of Neath, Wales. This fire-clay brick is very highly esteemed on the other side of the Atlantic. An imitation of it is made in Austria from quartz rock.

Dincklage-Campe, dīnk'lāg-ē-kām'pē, **Ama-lie (Emmy) von**, German novelist: b. Campe, Osnabrück, 13 March 1825; d. Berlin 28 June 1891. Her first novel, 'The Loving Old Couple,' was published in 1857. Though she traveled extensively and observantly in Europe and America, her themes for stories were nearly all from her own countryside; and she is called "the poetess of the Ems valley." Among her works are: 'The School of the Heart'; 'Tales of Home'; 'Pictures of Emsland'; (posthumously) 'Poems'; a story, 'The Woman Nihilist' (1893).

Dindigal, India, a city in the Madura district, Madras, with a fort on a rocky height. It manufactures cigars, and trades in tobacco and coffee. Pop. 20,203.

Dindings, dīn-dīngz', **The**, a British possession belonging to the Straits Settlements, consisting of two small islands and a strip of land on the coast of Perak on the west side of the Malay Peninsula; area about 200 square miles. See STRAITS SETTLEMENTS.

Dindorf, Wilhelm, vīl'hēlm dīn'dōrf, German classical scholar: b. Leipsic 2 Jan. 1802; d. there 1 Aug. 1883. He became in 1828 professor of literary history at Leipsic, but resigned in 1833 in order to devote himself entirely to literary work. He contributed to the edition of Aristophanes by Invernizzi and Beck (1820-34), and between 1835 and 1839 published at Oxford an edition of the same poet. Other works by him are editions of Æschylus (1841-51); Euripides (1834-63); Sophocles (1832-6); and De-

mosthenes (1846-51); 'Lexicon Sophocleum' (1871); 'Lexicon Æschyleum' (1873-6); and a new edition of Stephens' 'Thesaurus Linguae Græcæ' (1831-65).

Dindymene. See CYBELE.

Dingelstedt, Franz von, frānts fōn dīng'-ēl-stēt, BARON, German poet and dramatist: b. Halsdorf, Upper Hesse, 30 June 1814; d. Vienna 15 May 1881. His 'Songs of a Cosmopolitan Nightwatchman' (1841) shocked all officialdom, but had a great popular success; and his 'Poems' (1845) showed true poetic feeling and great descriptive power, the latter also visible in his travel sketches and stories; one of the most successful of the latter is 'The Amazon,' a society novel. His tragedy, 'The House of the Barneveldts' (1851) was a splendid success. He adapted plays from Molière, Shakespeare, and others, to the German stage, and wrote a volume of 'Studies and Copies After Shakespeare.'

Dingle, Philippines, a city of Panay, in the province of Iloilo; on Jalaur River, 18 miles north of the city of Iloilo. Pop. 11,000.

Dingler, Johann Gottfried, yō'hān gōt'frēd dīng'lēr, German chemist: b. Zweibrücken 2 Jan. 1778; d. Augsburg 19 May 1855. From 1806 to 1820 he conducted journals for calico printing, dyeing, and bleaching, and in 1820 began the well-known periodical called after him 'Dingler's Polytechnic Journal,' which at the time of his death had reached the 140th volume. The journal he founded still continues.

Dingley, Nelson, American legislator: b. Durham, Maine, 15 Feb. 1832; d. Washington, D. C., 13 Jan. 1899. He was graduated from Dartmouth College in 1853; admitted to the bar in 1856; purchased the Lewiston 'Journal' in 1856; edited a daily edition in 1865; and was its editor and proprietor till his death. He was elected to the State legislature in 1861; served in that body till 1865 and in 1868 and 1873, and was speaker of the House in 1864-5. He was elected governor of Maine in 1873, and re-elected in 1874; and was a member of Congress from 1881 till his death. From the beginning of his congressional career he was conspicuous as an advocate of the principle of protection and was author of the Dingley Bill (q.v.) of 1897. In 1898 he was appointed a member of the Joint High Commission.

Dingley Bill, The, in American history, a tariff law, enacted by Congress in 1897, and so named after Nelson A. Dingley who introduced the bill. The Dingley Bill was a revision of the Wilson and McKinley bills and increased the customs duties on wearing apparel and manufactured goods generally. See UNITED STATES — TARIFF IN THE.

Dingo, the Australian wild dog (*Canis dingo*), the only species of dog known to exist in both the wild and the domesticated states. It is sometimes considered as being of Asiatic origin, the theory being that it was brought to Australia by the first men who came there, and that it has since become wild. It is not found in Tasmania or New Zealand, in which the fauna is generally like that of Australia. The dingo has decreased in numbers, retreating before the advance of civilization, and suffering from the war made upon it by the settlers, whose flocks it preys upon. The animal is about two

and a half feet long, and nearly two feet high; has large erect ears and a bushy tail. It is tawny in color; some specimens, however, being pale and others almost black. In the wild state it is especially crafty and courageous, and hunts in packs sometimes containing 100 dogs. The native Australians seek the young dingoes, and having taken them from the lairs where they are found, bring them up as domestic animals. When well treated they are affectionate and trustworthy, and are used to help their masters in hunting the animals on which the natives live—opossums, snakes, lizards, etc. While the domesticated dingo is his friend and companion, the native Australian will hunt the wild dog, kill him, and having roasted him, will eat him with a keen appetite. Consult: Lydekker, 'New Natural History,' Vol. I. (1897). See Dog.

Dingrás, Philippines, city in the province of Ilocos Norte, in Luzon, 11 miles southeast of Laoag. It is on the Grande de Laoag River. The surrounding country is fertile. Pop. 12,600.

Dinichthys (Gr. *δεινός*, terrible; *ἰχθύς*, fish), a genus of enormous fossil fishes found in Carboniferous and Devonian rocks. They are usually classed with the *Dipnoi* (q.v.) as members of the order *Arthrodira*.
